The BUILDER'S JOURNAL
AND
ARCHITECTURAL ENGINEER

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

It is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious art; for the disciplined ranks of a distinguished profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . . . .

CAXTON HOUSE, WESTMINSTER

CONTENTS.

See also Contractors' Section, Fire-Resisting Construction Section, Concrete and Steel Section and Christmas Number Indices.

ABERDEEN, The Making of, 399.
Additions for G.P.O., Dublin, 365.

"Is it Art?"

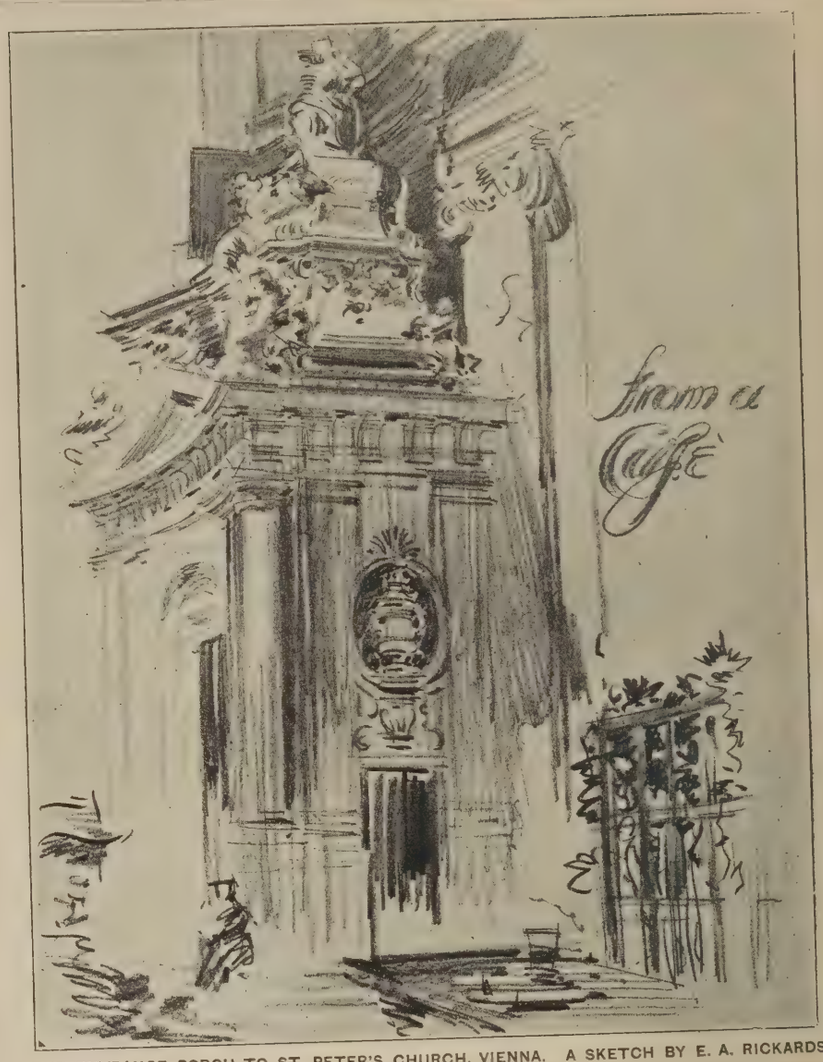
Much has been written concerning art in general and sculpture in particular, since the "Evening Standard" drew attention to the altogether unconventional and daring treatment of the figures used in the adornment of the new building of the British Medical Association in the Strand. We confess that when our contemporary's criticism first appeared we thought, in common no doubt with many others, that the attack made on the statues was merely one of the nature of those periodical outbursts of puritanical wrath against the employment of the nude in art to which we have grown accustomed, and with which we have not the slightest sympathy. But, after a careful inspection of the works in question, we feel bound to return an emphatic negative to the question propounded by the "Evening Standard," viz., "Is it Art?" For not only are some of the much-debated figures vulgar—not to say revolting in treatment (and Art is *never* either the one or the other), but even if they were all works of art it would be quite impossible for them, owing to the unsuitability of the architectural treatment of the niches in which they are placed, to adequately fulfil the purpose for which, presumably, they are intended, namely, that of adding to the æsthetic appearance of the building. We are sorry to notice that while, in the course of the controversy regarding these statues, much has been said relative to their inartistic appearance, no one has thought it necessary to refer, in terms of equal condemnation, to the character of the architecture of the building on which the statues are placed. But perhaps the majority of our art critics have yet to learn that architecture is the most important of the fine arts, and, consequently, that it is quite as necessary to provide city thoroughfares with beautiful buildings as to insist that any sculpture with which our street architecture may be embellished shall be artistic in its treatment and free from all objectionable elements.

The Gifts of the Drapers' Company.

By the recent grant of £22,000 for a new electrical laboratory to be attached to the University museum at Oxford, the Drapers' Company has given another proof that the objects for which the company was founded are still recognised by the court in the disposition of its funds. Among other valuable gifts made by the Drapers' Company, the following may be mentioned, namely, £30,000 to the University of London, to promote the incorporation of University College, £7,000 per annum to the People's Palace (to which institution it has otherwise granted various sums of money amounting in the aggregate to about £130,000), and £800 a year towards the foundation of the recently-established School of Agriculture at Cambridge. The Company has also provided the University of Oxford with its Radcliffe Memorial Buildings, whilst to the Poplar Hospital (to which it makes an annual subscription of £1,000) it has presented the necessary funds for the extension of the building.

A Note on Persian Architecture.

The troubles in Teheran have, it appears, involved the destruction of two fine buildings—the Parliament House, and one of the finest mosques in the city. Persian architecture would be peculiarly interesting if only because of its strongly marked national character. "In Persia," an authority on the subject has observed, "as perhaps nowhere else except in China, the art of architecture has been actively practised by natives, in their own way, without interruptions, from the sixth century B.C. down to our own day, borrowing freely, at times, from other styles, but never without a pronounced character, which is easily recognised." So strong is this persistency of type, that probably, in the inevitable exchange of architectural ideas that occurred after the Arab conquest, the Arabs got far more than they gave. Hence it happens that the most interesting remains of the first period (641-1221) of Persian architecture—a number of tombs, dating perhaps from the tenth century—are found, not in Persia, but near Bagdad, yet are nevertheless clearly Persian and not Arabic in style. The second of these periods into which Persian architecture is divided, begins with the conquest by Jenghis Khan in 1221, and ends with the accession of the Sefi dynasty in 1499. It is to the third period, of course, that the existing buildings mostly belong. Under Shah Abbas I. (1557-1628), who, besides being the greatest of modern Persian rulers, was one of the greatest of the world's builders, there was an extraordinary revival of architectural activity—the traditions of the past were developed into a distinctive style, which found expression in a large number and variety of splendid buildings, in which, although many European artists assisted in producing them, there is no trace of Italian or classic influence in the style; but Western ideas seem to be observable in the planning. The Sefi dynasty was ended by the Afghans in 1696, and there was no further architectural revival of importance until the beginning of the nineteenth century, when the Shah Feti Ali built several palaces and mosques that, while showing less purity of taste and altogether less nobility of character than the buildings of the Sefi period, are still magnificent. They include the celebrated Mirror Palace at Ispahan, the great mosque at Koum, and the Kasr-i-Khadjar Palace at Teheran. Characteristic details of Persian architecture are the arch resembling that of the Tudor period; the ingeniously executed brickwork vaulting; the peculiar "stalactite" vaults; and the many-coloured ceramic tiles that are used for exterior decoration instead of mouldings, which are rarely seen. The buildings that have just been destroyed were both erected about fifty years ago, by Hussein Khan. The mosque contained mosaic work of remarkable interest.



Haddon Hall Americanized.

The Society for the Protection of Ancient Buildings should be watchfully jealous of enterprising and wealthy Americans who are showing a disposition to deprive the Society of its reason for existence. This end they would achieve by buying up all our ancient buildings and deporting them across the Atlantic. What they would do with them when they got them is probably a syndicate secret. Possibly they might re-erect them and run trips to them; or it is just conceivable that they might dispose of them piecemeal to the keen relic hunters of the country. In this connection we may refer to the statement made in public by the Duke of Rutland recently to the effect that he has been "approached by a syndicate from that extremely pushful country, America, who had offered to remove Haddon Hall, stone by stone, and replace it in America, just as it now stood." The duke did not indicate the character of his reply; and beyond employing the somewhat injurious word "pushful"

(which, however, those to whom he applied it will probably regard as a compliment), he did not say anything in condemnation of the project. Perhaps he unburdened his mind in private, and was only restrained from repeating the operation in public by the awkward consideration that the transference from Attica to Bloomsbury of the Elgin marbles, which were mostly wrenched from the walls of the Parthenon at the instigation of a British ambassador, may afford us the physical means, but not the moral right, to throw stones at the vandals of other nations. Still, the Duke's revelation can certainly be classed as an item of useful knowledge; and, in the circumstances, it is reassuring to read, in the Parliamentary reports, that Mr. Asquith, replying to a question in the House last Wednesday, said that he had received several communications asking for the appointment of a Royal Commission on Historical Monuments in England, and there seemed to him to be an equally strong case with regard to Scotland and Wales. Judging from the trend of events, it may yet become necessary to pass an Act for the Prevention of the Exportation of Historical Buildings!

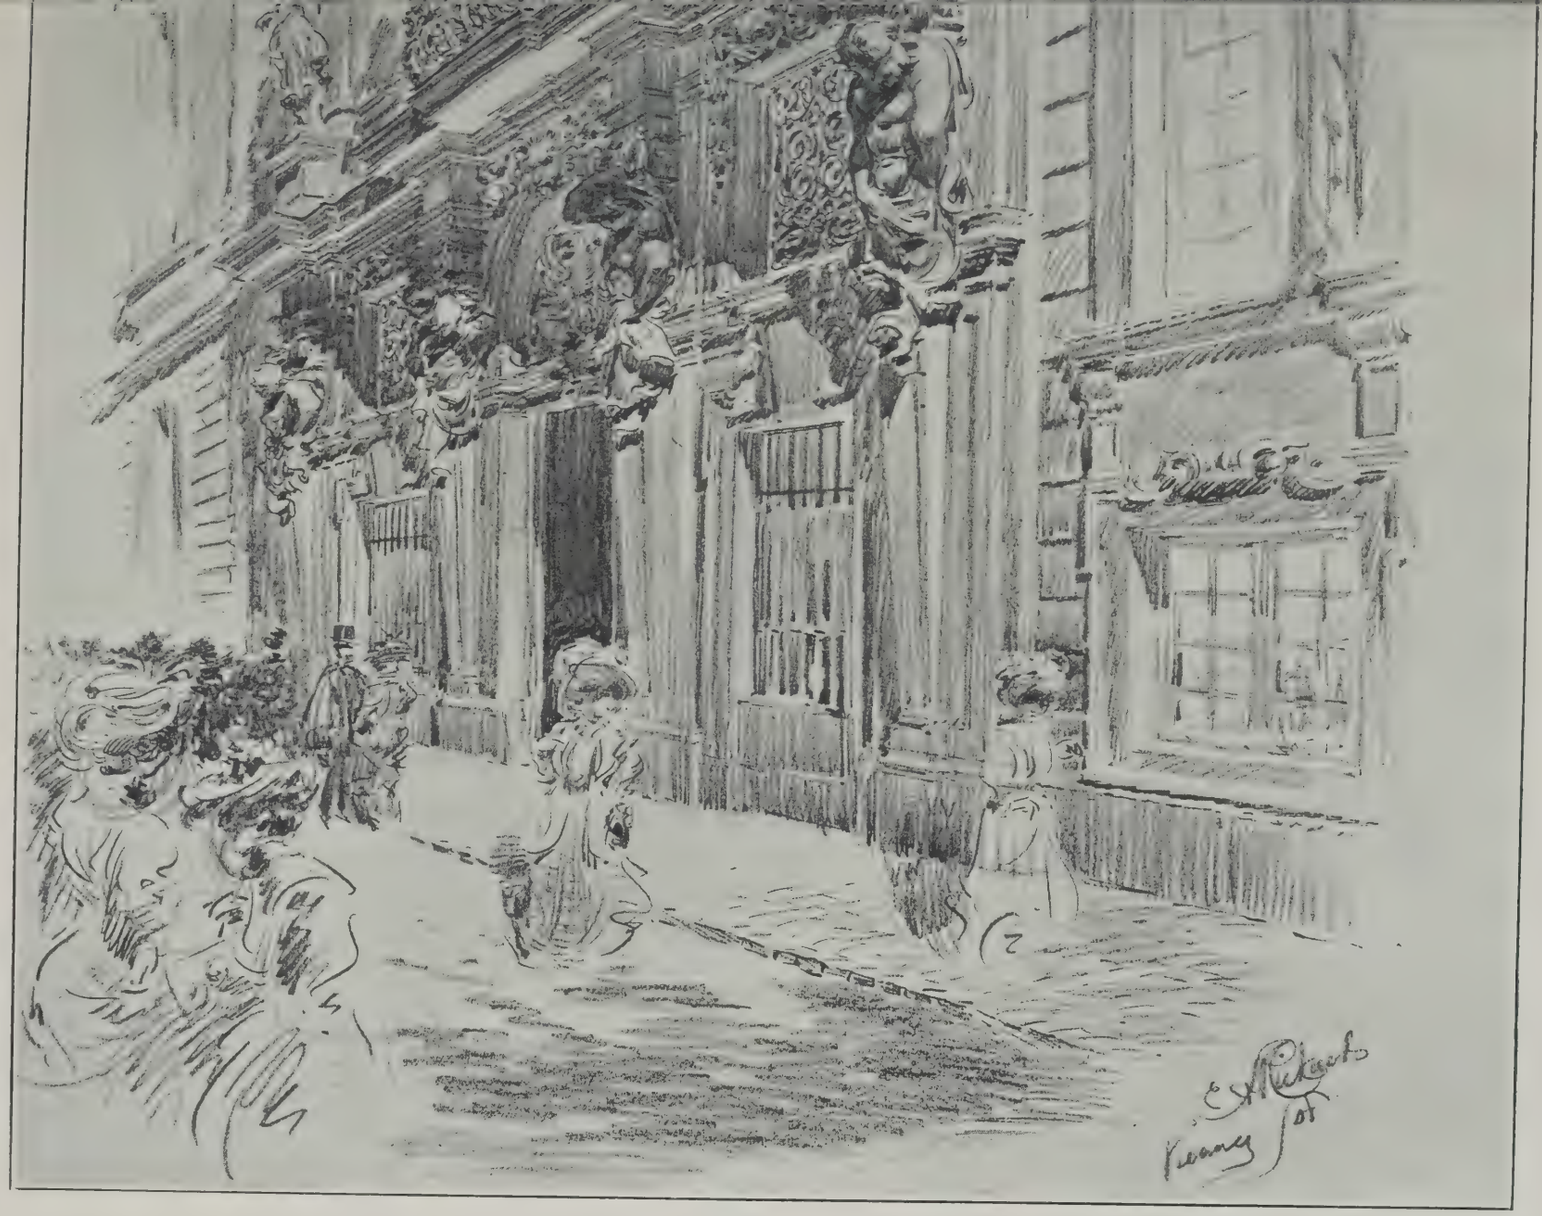
The Shakespeare Memorial.

At a meeting of the General Committee of what has come to be known as the "Portland Place" promoters of the movement to erect a memorial worthy of our national poet, it was decided to adopt the report of their executive, which recommended that the "two general committees (*i.e.*, those in favour of the erection of a statue and those who support the scheme for a National Theatre) as they stand at present shall be amalgamated, and that an executive committee shall be elected from the general committee thus formed." But although there now appears to be a reasonable prospect that the two monuments will merge into one scheme for the establishment of a National Memorial Theatre, it is notable that the "Portland Place" committee has only consented to the amalgamation on condition that the National Theatre shall take the form of a "building which shall be a symbol of the world's tribute to Shakespeare"—whatever that may mean. Meanwhile, as the "Daily Chronicle" points out, the problem of the Shakespeare Memorial has been satisfactorily solved, "at least for the many North London residents who haunt it on Sunday mornings and week-day evenings," by the formation, in a portion of the beautiful grounds of Waterloo Park, Highgate, of a garden of "blossoming herbs and plants redolent of the spirit of Shakespeare." Here, enclosed by a screen of old trees, without a trace of artificial culture or planning to spoil the whole, and set in quaint box borders, are many of the old-fashioned flowers and herbs that Shakespeare loved and mentions in his works. And Waterlow Park is sufficiently rich in historical associations to make it a fitting surrounding for such a garden, although it is now difficult to imagine that its gravel paths and grass lawns have been traced on what was formerly the hunting and hawking ground of Henry VIII. A small brass tablet alone marks the site of the former cottage of Andrew Marvell, the colleague of John Milton in 1657, in the Secretaryship for Foreign Affairs; but there is a fine old house still existent in Waterlow Park which formerly belonged to Lord Lauderdale, and it was here he was visited by Pepys, who duly records the fact in the famous Diary which has thrown so much sidelight upon the Court of Charles II. Here, too, for a time, lived Nell Gwyn, for whom the King purchased the house from Lord Lauderdale.

THE ENTRANCE PORCH TO ST. PETER'S CHURCH, VIENNA. A SKETCH BY E. A. RICKARDS.

The New Hotels and Theatres of London.

If the popularity and general prosperity of the Metropolis may be safely gauged by the ever-increasing number of its new hotels and theatres, London would appear to be in a very flourishing condition, for during the past twelve years the hotel accommodation has been more than doubled, either by the enlargement of existing establishments, or by the erection of new buildings. This increased accommodation may be summarised as follows: The Savoy (extension), the Cecil (extension), the Ritz, the Carlton, the Hotel Russell, the Piccadilly, the Waldorf, Princes Restaurant, the Kenilworth, the Trocadero Restaurant, the Gaiety, St. Ermin's Hotel, the Royal Palace Hotel, Kensington, the Imperial Hotel, and the Tudor, Oxford Street. There has been a corresponding increase in the number of theatres, as within the period named the following have either been erected or rebuilt on a more elaborate scale: the Aldwych, the Apollo, the Coliseum, the Coronet, the Gaiety, the Hippodrome, His Majesty's, Hicks', the New, the Pavilion, the Queen's, the Playhouse, the Scala, the Kingsway, Wyndham's, and the Waldorf. It is much to be regretted that of the buildings scheduled in the above list, only the Waldorf and the Ritz hotels add materially to the architectural beauty of the streets in which they are placed.



The Architects' Technical Bureau.

We understand that the Catalogue and General Information Department of the Architects' Technical Bureau has been opened, and that an "up-to-date" index of manufacturers' catalogues is now in course of completion, to enable any information required by subscribers to be immediately supplied. Numbers of enquiries relative to the cost of the materials and specialities of various firms are received daily, and the replies, consisting of the pamphlets or loose pages of the various manufacturers' catalogues, which have been filed for this purpose, are despatched to the Bureau's subscribers with the utmost promptitude. To save time and trouble, subscribing architects have been provided with a small packet of enquiry cards, one of which can be readily filled in and posted to the secretary of the Bureau when information is required.

CHANGE OF ADDRESS.—Mr. W. H Ansell, A.R.I.B.A., is moving his office from 18, Guildford Street, Russell Square W.C., to 10, New Square, Lincoln's Inn W.C. (Telephone: 3,730, Central.)

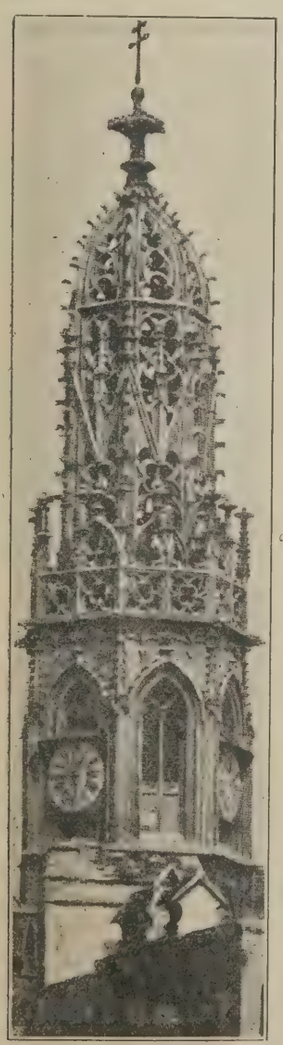
THE MINISTRY OF THE INTERIOR, VIENNA: A SKETCH OF THE MAIN ENTRANCE, BY E. A. RICKARDS.

SOME IMPRESSIONS OF VIENNA.—II.



By Alfred W. S. Cross and E. A. Rickards.

(Continued from p. 521, No. 698.)

The Cathedral of St. Stephen.

In the heart of the narrow and irregular streets of the inner city stands the cathedral of St. Stephen—the most imposing of the few mediæval buildings still to be seen in Vienna. It dates, in its present form, chiefly from the 14th and 15th centuries, but it possesses a few remains of the earlier structure, of which the Riesentor, or Giants' doorway (embellished with Romanesque sculpture) of the west façade has been much mutilated by the insertion, in the 14th century, of the large window placed immediately above it, but the two towers known as the Heidentürme (heathen towers) still retain many Romanesque features. In 1340 the original polygonal choir and other portions of the church were destroyed, to make way for the erection of the present nave and aisles. The south tower, nearly 450ft. in height, dating from 1359-1433, was built in 1860-1864 to replace the former tower (which was in a dangerous condition), whilst the still unfinished north tower received its upper stage in 1579.

The huge interior, 354ft. long and 105ft. broad, is insufficiently lighted, and, consequently, presents a rather gloomy appearance. But the richness of the 15th-century nave vaulting (which is supported by massive pillars adorned with more than 100 statues), the marble high altar, the side chapels and monuments, the numerous baroque altars, and the brilliant colour of some old stained glass, all serve to improve its appearance, and to render it of great interest to the architect.

THE TOWER OF THE CHURCH OF MARIA AM GESTADE.

THE CHURCH OF ST. PETER.

Maria am Gestade.

The 14th and 15th century church of Maria-Stiegen (*Maria am Gestade*) consists of a narrow and lofty nave, without aisles. Its late 15th-century heptagonal tower, 195ft. in height, is terminated by a delicately-carved open-work turret.

The Spinnerin-am-Kreuz.

Another interesting example of 14th-century architecture is the ancient memorial cross, 65ft. high, which stands in the Triester-Strasse, and is known as the Spinnerin-am-Kreuz. But whether the conclusion be based upon the evidence afforded by these few examples of the work of mediæval builders, to which we have briefly alluded, or upon that presented by the designs of modern architects, there can be no doubt that Gothic art, at its best, is not worthily represented in any building, ancient or modern, in Vienna. Indeed, of the many styles of architecture observable in that city, the baroque is the one alone whose full significance appears to have been realised and properly appreciated by Viennese architects. Within a few minutes' walk of St. Stephen's, there is to be seen, in the neighbouring church of St. Peter, a fine example of that style as it was understood by one of its earliest exponents in Vienna—the great architect Fischer von Erlach.

The Church of St. Peter.

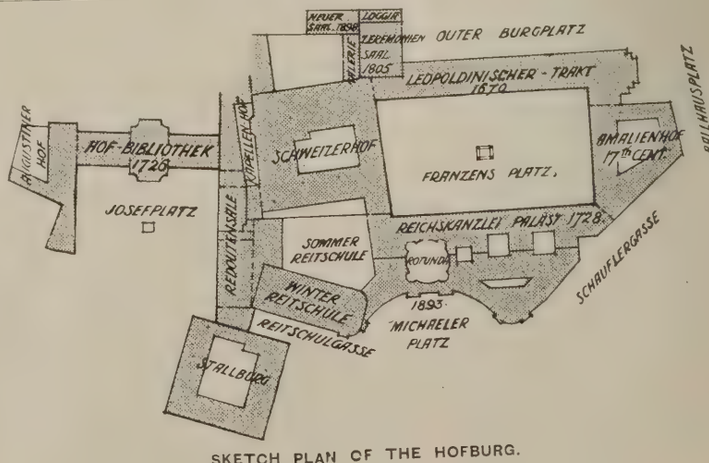
The oval plan of this building is expressed, quite consistently, by a large, similarly shaped dome, and the varying contours of its walling, formed by the juxtaposition of convex, concave and straight surfaces very skilfully treated at their intersections, unite in producing an effect that is extremely picturesque and attractive. The west wall, which is slightly curved on plan, and thus forms a suitable seating for the domed porch, is flanked by well-designed twin towers. The leaden figures of the richly ornamented porch roof are by Kohl. The south front has recently been embellished by the insertion of a large panel, with figures in relief by R. Weyr, the subject being "Charlemagne in the Ostmark." The interior of the church has a finely painted ceiling (by Rottmayr and Bibbiena), and some beautiful altar-pieces.

The Hofburg.

At the south extremity of the Kohlmarkt, facing the Michaeler-Platz, is the Hofburg—the residence, since the 13th century, of the Imperial family. It consists of an extensive irregular group of buildings, of various epochs and styles, enclosing several courtyards. The north block, known as the Reichskanzlei-Palast, was erected in 1728, after the designs of Fischer von Erlach, to whom Vienna owes so many fine examples of 18th century art, including the recently completed (1890-1893) curved north-east facade, which was carried out by Ferd. Kirschner, in accordance with the plans left by the original architect of the palace. The scholarly architectural treatment of this portion of the buildings at once arrests attention. The façade

THE "SPINNERIN AM KREUZ."

THE HOFBURG: ENTRANCE DOORWAY ON INNER FACADE OF REICHSKANZLEI-PALAST.



consists of a stately structure four storeys in height, of which the two lower ones are rusticated, and the upper ones grouped together by columns and pilasters supporting an unbroken entablature. The central portion is emphasised by a square projection, enclosing the large central archway which forms the main carriage drive. Over it is the following inscription:—"Franciscus Josephus I. vetus platatii opus a Carolo VI. inchoatum, a Maria Theresia et Josepho II. continuatum perfecit, A.D. MDCCCXCIII." Above is a freely treated attic pediment enriched with sculptured groups of Justice, Wisdom, and Strength, and immediately behind rises the graceful outline of the plainly treated done. The flank walls, circular on plan, are terminated by smaller domes springing from square projections, which also serve as stops to the concave wall surfaces of the main portions of the façade. Centrally placed in rustic niches, formed in the convex portions of the flank walls, are some wonderfully conceived and executed colossal fountain groups sculptured in white marble, that to the east (or left) symbolising Naval Power (R. Weyer, 1895), and that to the west (or right) Military Power (E. Hellmer, 1896). If any other evidence were not forthcoming (and this is by no means the case), these two great efforts of modern artists would, in themselves, be amply sufficient to prove the fact that in Vienna the sculptor's art still exists at its best, and that the methods and traditions of old-time masters, such as Raphael Donner (1693-1741), said to be the first Viennese sculptor of any great eminence, of J. W. Beyer (1725-1806), of Hagenauer (1732-1810), of Fischer (1740-1820), and of Franz Zauner (1746-1822), are being continued with surprising success by men of our own time. For not only do the great epics in marble which adorn the Michaeler-Platz exhibit immense power of design, but their wonderful modelling displays an amount of anatomical knowledge that is usually only to be found, to a similar extent, in the products of the mighty genius of Michel Angelo and other great masters of the Italian Renaissance.

In addition to the two large fountains, four Hercules groups, similar in scale to the older groups in the Franzens-Platz, and representing the Fight with the Hydra (H. von. Aspernburg), the Rescue of Hesione (Joh. Scherpe), the Deliverance of Prometheus (Jos. Lax), and the Fight with Cerberus (A. P. Wagner), are placed on either side of the central archway, where they form a most effective contrast with the plain and massive rustications of the adjoining wall surface.

The large Rotunda, which connects the Michaeler-Platz with the Innere-Burghof, or Franzens-Platz, has a finely treated plaster domed ceiling, and is appropriately decorated with reliefs and large allegorical figures set in niches. The inner courtyard (the Franzens-Platz), architecturally one of the most attractive of the many places of interest to be found in Vienna, is surrounded on four sides by extremely picturesque groups of buildings of various periods of design. In the centre stands the bronze monument of Francis I., of which the inscription consists of an extract from the Emperor's will, namely: *Amorem meum populis meis.*

The inner façade of the Reichskanzlei-Palast, designed by Fischer von Erlach, was completed in 1728. Of the window openings of its five storeys, two are contained in the rusticated lower portion of the structure, two are grouped together within the vertical limits of the pilastered order with which the front is embellished, and those of the fifth storey are placed in the deep frieze of the main entablature. The entrances from the Franzens-Platz are adorned by four Hercules groups (by Matthielli), representing Antaeus, Busiris, the Nemean Lion, and the Cretan Bull.

Opposite the Reichskanzlei-Palast, and occupying the south-west side of the Franzens-Platz, is the Leopoldinische-Trakt, built by Leopold I. in 1670, containing the State apartments of His Majesty, including the splendid "Rittersaal," once occupied by Maria Theresa and Joseph II., and the military office of the Emperor.

SKETCH PLAN OF THE HOFBURG.

Adjoining the Franzens-Platz, on the north-west side, is the Amalienhof, erected at the end of the 17th century, containing the crown equerry department. A passage in the south-east corner of the Franzens-Platz, conspicuous by coloured and gilded armorial bearings, leads across the drawbridge to the 16th-century Schweizerhof, the oldest part of the Burg now left, and near it is the Burgkapelle, of which the end of the choir is the only relic of the original Gothic building of 1449. In the left-hand corner of the Schweizerhof is the entrance to the Schatzkammer (Imperial Treasury), containing the family treasures of the house of Hapsburg, and consisting of some finely panelled rooms of the 18th century.

THE HOFBURG (OR IMPERIAL PALACE), VIENNA: FACADE TO THE MICHAELER-PLATZ. FISCHER VON ERLACH, ARCHITECT.

On the right, the Augustine corridor leads to the Josefs-Platz and the Augustine Church. The Josefs-Platz is adorned with an equestrian statue of the Emperor Joseph II., and contains on its north-east side the *Palais Pallavacini*, erected in 1784, noticeable for the colossal double caryatides placed at the principal entrance, and on the north-west side the Redoutensäle, or ball-rooms, and the Winter Riding School, designed by Fischer von Erlach. The Stallburg, which dates from 1529, is connected with the Hofburg by an arcade, and provides the requisite accommodation for the military officials.

The Imperial Library, occupying the south-west side of the Josefs-Platz, is another of the numerous Viennese buildings which owe their being to the creative genius of Fischer von Erlach. Erected in 1722, its richly decorated great hall, 255ft. by 54ft., contains statues of Charles VI. and other princes of the house of Hapsburg, and its fine dome is embellished with frescoes by Daniel Gran. This library is said to contain 800,000 volumes, including 7,000 *incunabula* (among which are the only complete copy of the Psalter of Fust and Schöffer (1457), Gutenberg's 42-line Bible, and some books printed by Caxton and Wynken de Worde, 24,000 manuscripts, 400,000 engravings, and the celebrated papyrus of the Archduke Rainer, consisting of a large collection of documents, in ten languages, discovered in 1877 in the Fayûm in Egypt.

The new wing of the Hofburg, designed in the Renaissance style by G. Semper, under whose scheme it was originally proposed to erect a corresponding building on the outer Burg-Platz skirting the Volksgarten, consists of a four storeyed structure with a long curved frontage, flanked by square wings. The building is divided vertically into two almost equal parts, the lower of which is heavily rusticated, and the upper treated as an open colonnade with coupled columns supporting a balustraded entablature. It is most unfortunate that the continuity of this fine design should have been destroyed, to the great detriment of the composition, by the introduction of the central projecting part, which not only ruins the effect of the sweeping lines of the colonnade, but is, in itself, so much out of scale with the surrounding portions of the front that the main entablature of the structure has had to be broken to obtain the necessary height for the larger order employed in this the central feature of the elevation design. This violation of one of the first rules of classical architecture is a great blot on what would otherwise be a very successful effort of design.

The Old University Building.

The old building, erected in 1755, which stands in the small Universitäts-Platz, formerly formed part of the University, but it is now occupied by the Academy of Sciences. It is a finely designed symmetrical structure, containing two storeys and an attic, and the composition of the front façade, which consists of slightly projecting pedimented wings adorned with pilasters and a recessed central portion forming an open arcaded loggia at the first floor-level, is clever and attractive. In the lower storey, which is rusticated throughout, the central circular-headed opening forms the principal entrance doorway; the two adjoining openings are filled in with windows, and in the corresponding circular-headed arch-

ways in the wings there are some exceedingly well-designed mural fountains enriched with sculptured groups of boys and dolphins. Above the loggia the attic storey is set back to the line of the recessed wall below it, the entablature in front being completed by iron balustrading, broken by groups of statuary. The central portion of the attic is carried up to sustain a well-designed coat-of-arms surmounted by the Imperial crown, and supported by eagles, beneath which is an inscription recording the fact that the building was erected by Francis I. and Maria Theresa in 1753.

Adjoining this most interesting and beautifully designed structure is the University Church, a very early and rather crude example of the baroque style.

Platz-am-Hof.

The Platz-am-Hof, formerly the site of the old castle of the ducal house of Babenberg, is the largest and most interesting square in the interior of the city. Here there are many buildings of architectural and historical interest, including the Civic Arsenal, built in 1562, but having a façade of 1732, and the Church-am-Hof, formerly belonging to the Jesuits, the front of which dates from 1662. The Column of the Virgin, erected by Leopold I. in 1667, and the equestrian statue of Field-Marshal Radetzky by Zumbusch), stand in the centre of this square.

The Ministry of the Interior and the Old Rathaus.

Placed between the small Juden-Platz and the Wipplinger-Strasse is the attractive building now used for the purposes of the Ministry of the Interior, which was formerly the Bohemian Hofkanzlei. It was erected in 1716, after the designs of Fischer von Erlach, and immediately fronting it, on the opposite side of the street, is the old Rathaus, or Magistrats-Gebäude, of which the street front dates from 1706. In the internal courtyard of the last-named building is the charming mural fountain, by Donner, with its well-known relief of Perseus and Andromeda.

THE KARLSKIRCHE. FISCHER VON ERLACH, ARCHITECT.

THE OLD UNIVERSITY (NOW THE ACADEMY OF SCIENCES).

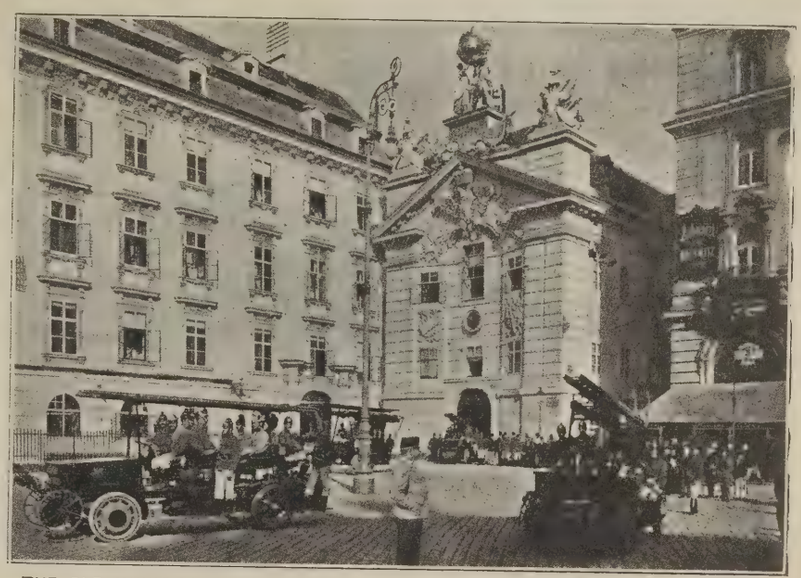
In the front façades of these two examples of early 18th-century architecture (for in the back and side elevations there is some very objectionable rococo work) all the essential elements of the best phase of the baroque style may be seen and studied, and it is apparent that their designer has directed his efforts to the attainment of something more than the usual stately architectural effect resulting from the application, in a scholarly manner, of well-worn mouldings and enrichments culled from the best period of the Italian Renaissance. But his determination to disregard precedent in the arrangement and treatment of the details themselves has led to no general distortion of the orders and their attributes—to no attempt to destroy the pristine beauty of proportion and outline in which they were handed down to later architects by their old-time originators—to no effort to disturb the regularity and continuity of the main entablatures. In other words, it is clear that the architect did not strive to simulate originality by the production of burlesque imitations of the works of ancient artists. And yet, whilst in the general simplicity of their "setting-out" and proportions these buildings are architecturally as correctly arranged as a Greek temple, whilst the contours of their mouldings do not vary, to any appreciable extent, from those of their Italian prototypes, they undoubtedly *appear* to be remarkably free from the limitations imposed by architectural conventionalisation and pedantry. For this reason there can be no doubt that their æsthetic success is due to that happy combination, so rarely met with among modern architects, of scholarship and genius.

THE RATHAUS.

The Karlskirche.

This well-known building, which, with its lofty copper dome and twin belfries, modelled on Trajan's column at Rome, forms a conspicuous landmark on the Karls-Platz, was erected in 1716-36. Although it presents many features of striking originality, it is not, on the whole, one of the best examples of the work of Fischer von Erlach. Its plan bears a considerable general resemblance to the smaller church of St. Peter, already described.

The Rathaus.



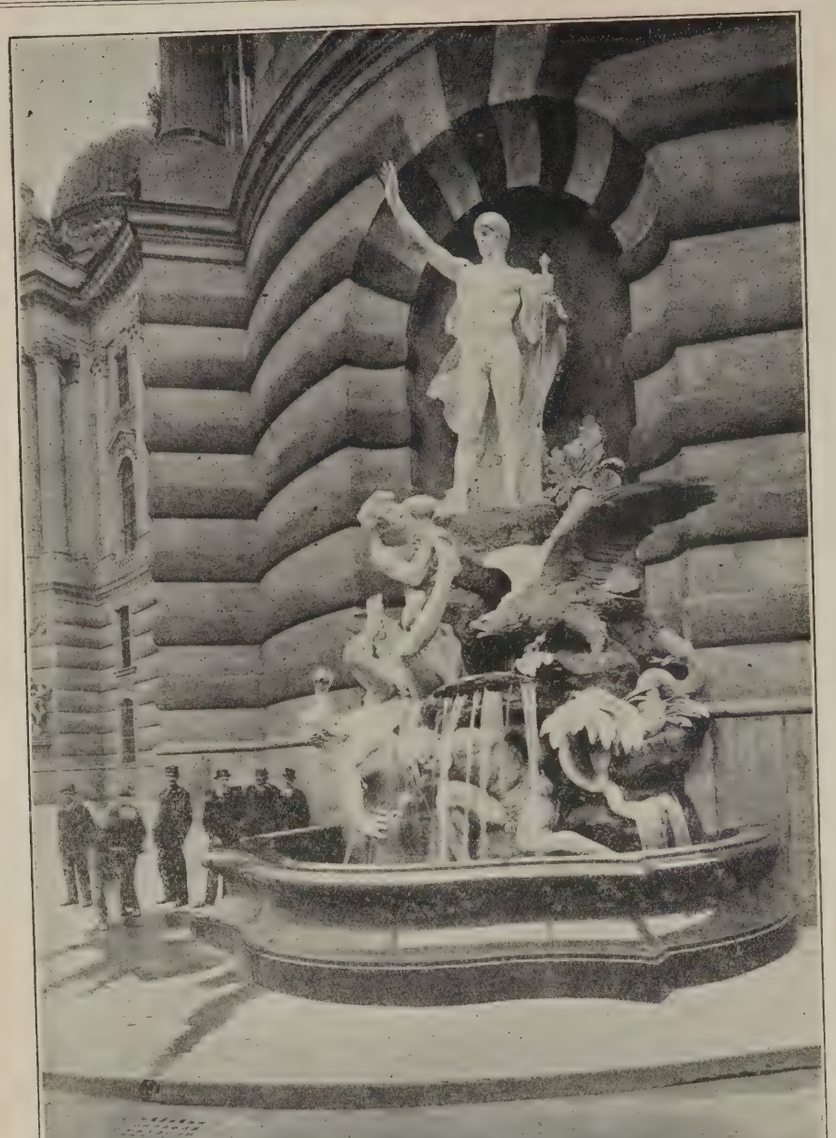
The Rathaus, or Town Hall, an imposing late Gothic structure, profusely decorated with statues, and reminiscent, at least in its outline, of some well-known civic buildings in Belgium, was erected in 1873-83 after the designs of the Viennese architect, Fried Schmidt, whose statue, by Ed. von Hofmann, was placed in the gardens in the rear of the Rathaus in 1896. The lofty tower, 320ft. in height, is enriched with reliefs of Francis Joseph I., Rudolph of Hapsburg and Duke Rudolf ("the Founder"). The plan, which is very symmetrically arranged, has a large central arcaded quadrangle and six smaller courtyards, and the magistrates' court, the council chamber (adorned with frescoes by Ludw. Mayer), the "Volkshalle," the two main staircases of marble, the reception hall, and many other rooms possess attractive and interesting features of design.

Imperial Museums.

The Imperial Museums, two large Italian Renaissance buildings exactly corresponding in design—each having a central dome and slight wing projection—are placed on the east and west sides of the Maria-Theresien-Platz in the Burg Ring. These structures were erected in 1872-89 to contain the natural history (W) and the art history (E) collections belonging to the Imperial family, but they are not very successful examples of the architectural powers of their designers, Semper and Hasenauer.

The Houses of Parliament.

In the imposing Reichstats-Gebäude, or Houses of Parliament, built in 1883 after the designs of Hansen, the Chamber of Deputies and the Upper House form practically two independent buildings connected by a magnificent central hall,



THE OLD MUNICIPAL ARMOURY (NOW THE CENTRAL DEPOT OF THE FIRE BRIGADE).

THE HOUSES OF PARLIAMENT.

about 135ft. long and 75ft. wide, which is enriched with 24 monolithic marble columns and a fresco frieze representing historical events. The central feature of the façade consists of an octastyle portico, raised one storey in height above the ground level, and approached by cleverly devised winding roadways placed round the lofty Minerva fountain, which has a colossal statue of Pallas Athene, by Kundmann, and female allegorical figures and groups of children by H. Hardtl, R. Weyr, and J. Tautenhayn. The roadway approaches are flanked by bronze groups of horse-tamers by Jos. Lax, and are further embellished with statues of eight Greek and Roman historians—to the left Xenophon, Thucydides, Herodotus, and Polybius; to the right, Sallust, Julius Cæsar, Livy, and Tacitus. But, although extremely well detailed in the Greek style, and, in itself, presenting a very scholarly and pleasing appearance, yet this fine portico entrance is entirely out of scale with the two-wing buildings it is intended to unite. And this unfortunate want of scale is quite unnecessarily emphasised by the repetition in the wing

THE HOFBURG: MONUMENTAL FOUNTAIN REPRESENTING "MILITARY POWER." E. HELLMER, SCULPTOR.

buildings of the same (Corinthian) order designed to a much smaller scale—a fatal mistake which no Greek artist could possibly have made.

The Opera House.

The Imperial Opera House occupies an isolated site bounded on the south by the Opera-Ring. Its plan possesses many admirable features, such as the spacious front and side colonnades and the numerous and well-arranged staircases. Externally, although the design is marred by the introduction of three-centred arches over the ground floor openings, it is, on the whole, a fine example of the early Renaissance style of architecture.

The Hofburg Theatre.

Opposite the Rathaus, on the east side of the King-Strasse, is the Hofburg-Theatre, completed in 1889, after the designs of Semper and Hasenauer. The building possesses much originality, and is admirably planned, but, like some other examples of Semper's work, it is spoilt, as an architectural monument, by a want of proportion in the scale of some of the orders employed—as, for example, in the wing buildings containing the grand staircases—which do not harmonise with those of the central feature of the façade.

(To be concluded.)

SURVEYORS' INSTITUTION EXAMINATIONS.—In connection with these examinations, Mr. H. Stanton Webber, F.S.I., building and quantity surveyor, of 47, Queen Street, Maidenhead, gives tuition by correspondence. At the Professional examinations of the Institution held in March last, more than two-thirds of the pupils coached by Mr. Webber were successful in passing.

"A REASONABLE POLICY FOR PROTECTING ANCIENT BUILDINGS" was the subject of a paper read by Sir John Stirling Maxwell before last week's meeting of the Society for the Protection of Ancient Buildings. Sir John outlined a scheme for the creation of a central monument commission for each of the three kingdoms (with £20,000 a year to administer for England, and the other kingdoms in proportion), and monument commissions for each county in addition.

Law Cases.

CLAIM IN RESPECT OF A HEATING INSTALLATION.—In the High Court of Justice, King's Bench Division, on Saturday last, Mr. Edward Pollock, one of the Official Referees, gave judgment in the case of *Edward Parker Milne* v. *Frank Arthur and Henry Arthur*, trading as Frederick Arthur. The claim was for £390 3s. for providing, fixing, and installing a boiler, heating apparatus, and hot water service at Barrow Hills, Virginia Water, and it was resisted on the ground that the installation was unsatisfactory. Defendants counterclaimed the sum of £655 7s. 11d., the cost of rendering the installation efficient. The reply to the counterclaim was that plaintiff, who had been always ready and willing to fulfil the terms of his contract by making good any fault or failure notified within twelve months of completion, had not been afforded a reasonable opportunity of fulfilling these conditions, another firm having been called in within a few days of the final testing of the apparatus. The trial lasted eighteen days, and the Official Referee, in delivering judgment, said it appeared to him that the inefficiency of the system did not arise, as the plaintiff contended, from some defects in the brickwork flue. Judgment would therefore be given for the defendants on the claim; judgment on the counter-claim to be deferred for ten days in order to give the parties an opportunity of coming to terms.

AN ALDWYCH THEATRE SITE CLAIM.—In the King's Bench Division, before Mr. Justice Channell, on June 24th, Mr. Wm. George Robert Sprague, theatrical architect, sued Mr. Murray Carson, actor and dramatic author, for £2,006 for professional services, which included the procuring of a site for a theatre (now occupied by the Aldwych Theatre), and the preparation of plans for the proposed building. Defendant pleaded that the work was of a speculative character, and denied there was a promise to pay unless a certain sum of money was raised.—Plaintiff stated that Mr. Carson, as far back as 1902, asked him to find a good site for a theatre. He introduced defendant to the surveyors of the Duke of Bedford's estate, and finally defendant agreed to take the Aldwych site for £3,500 per annum. Witness prepared plans for a theatre, but the project was abandoned.—In cross-examination, witness denied the suggestion that Mr. Seymour Hicks had bought the plans for the building of his theatre.—Defendant said plaintiff told him there was to be an hotel built in Aldwych, and that the site was also suitable for a theatre. Witness gave no instructions to find a site, but he said he should like to have a theatre, and if an attractive scheme was prepared he could probably raise £9,000 amongst his personal friends. He however, failed to raise the money, and he told the plaintiff so.—Mr. Low: Did you promise to pay £500 on account?—The effect of what I said was that if I got the money I would let him have a cheque, but I made no promise to pay £500.—Eventually it was arranged that there should be judgment for the plaintiff on terms agreed upon between the parties.—His Lordship: I think that is very satisfactory. It is quite obvious plaintiff is entitled to a substantial sum. and it is equally obvious whatever his legal rights are, he ought to make an abatement to the defendant.

IN PARLIAMENT.

(By our Press Gallery Representative.)

The Borstal System.

In the House of Commons last week, Mr. Ernest Lamb asked the Home Secretary whether convict labour was competing with, and to some extent displacing, free labour in the construction of the new prison at Borstal; and, if so, whether he would take any steps to remedy this state of things.

Mr. Gladstone replied :—"No, sir. There is no such competition or displacement. One new wing of the prison will be built entirely by outside labour. On the others, one of which is now being commenced, the labour of the inmates will be utilised as far as possible. It is the traditional and accepted policy of the Department to utilise prison labour for building purposes whenever it is practicable to do so. To deprive prisoners of this work would be to take away from them the opportunity of useful employment and trade instruction which, in accordance with the prison rules, must be provided for them as far as possible. This rule applies with special force to Borstal, where young prisoners are sent expressly for such practical training. The special treatment known as the 'Borstal System' would not exist at all if such training could not be given."

An M.P.'s Joke.

Mr. Watson Rutherford, the Liverpool member, who has been watching closely the First Commissioner's designs upon Delahay Street and the Institution of Civil Engineers in Great George Street, which are about to be demolished under the Public Offices extension scheme, has, in his waggish way, put down the following question with regard to the Trafalgar Square works :—"To ask the First Commissioner of Works, what is the object or utility of the three parallel tunnels now in course of construction at the proposed entrance to the park from Trafalgar Square; what is the length of each tunnel and the width; whether artificial light is proposed to be used in each tunnel; whether the centre tunnel is intended to be a reserved tunnel, and, if so, under what conditions; who is responsible for the design, and what style of architecture, if any, it is supposed to be; whether the buildings will eventually take the form of a semi-circus on each side; what is the estimated total cost of buildings constituting the circus and the tunnels; what the buildings are proposed to be used for; and whether he would be willing to give reasonable notice to Parliament before undertaking any works of a similar type."

Mr. Harcourt may be expected to deal with the question in a humorous and pointed manner.

Historical Monuments.

Mr. Horniman asked the Prime Minister whether he had received any letters or petitions asking for the appointment of a Royal Commission for England and Wales, such as that recently appointed for Scotland, to prepare a list of ancient and historical monuments and constructions; whether he could give the names of the more important bodies which had so approached him; and whether he would recommend that such a Royal Commission be now appointed.

Mr. Asquith, in reply, stated that he had received communications on the subject mentioned in the question from the Royal Historical Society, the Society for the Protection of Ancient Buildings, the Society of Architects, the Royal Institute of British Architects, and the Photographic Survey of Warwickshire, and he was considering the representations made by these bodies.

The Law Courts Extension.

Mr. Harcourt, in the recent debates in Committee of Supply, and in reply to questions, has intimated the determination of the Office of Works to build the Law Courts extension upon the garden ground lying to the west of the existing buildings, stating at the same time that the ground was always intended to be used for this purpose. A good many members have expressed their regret at the clearing away of the open space, and Mr. Alden asked the First Commissioner whether he would consider the question of appointing a Select Committee to enquire into the existing accommodation of the Law Courts, with a view to ascertaining how far a rearrangement of courts and rooms might be made which would obviate the necessity of building upon the existing garden and open space.

Mr. Harcourt in reply said : I regret that I am unable to adopt the proposal of my honourable friend. The question of accommodation has been considered very fully with the judicial authorities, and no rearrangement such as he suggests is possible.

VULCANITE ROOFING.

This well-known roofing material is being more and more used as its excellent qualities come to be appreciated. Despite the imitations which have been put on the market, "Vulcanite" is extensively adopted not only as a covering for wooden roofs (for which it was first chiefly used), but also in place of asphalt for roofs of steel and concrete construction; the reason being that "Vulcanite" will not fracture by reason of settlement, vibration of machinery, or heavy traffic, or the expansion and contraction of steel and concrete. We understand that the manufacturers—Vulcanite, Ltd., of 118, Cannon Street, London, E.C. —have had an exceedingly good year; among the work executed by them being the new Humber works at Coventry, where about 15,000 super. yards of "Vulcanite" have been laid; while a still larger contract, namely, the roofing of new works of the Wallpaper Manufacturers, Ltd., at Greenhithe, requiring approximately 20,000 super. yards, is now being executed by them.

BRITISH v. FOREIGN GRANITE.

At the recent annual general meeting of the United Kingdom Granite and Whinstone Quarrymasters' Association, held in Glasgow, attention was directed to the use of foreign setts, kerb, and channel for street and road work, the Association strongly expressing the view that the home quarry owners have a distinct grievance in respect that a number of public bodies throughout the Kingdom, when inviting tenders for setts, kerb and channel, specify that the material to be used shall be either Norwegian, Swedish, or other foreign stone. They feel that by such a stipulation they, as British quarry owners, are practically shut out from competing. Reference was also made to the large quantity of stone which would be required in the execution of the naval base at Rosyth, and the Association agreed to make every endeavour to secure that the stone to be used should be of British production. The question of workmen's compensation insurance and the exorbitant premiums demanded by insurance companies was also discussed, and it was remitted to the committee of the Association to consider the whole matter, and report to a further general meeting. Mr. H. J. Grace, of the Enderby and Stoney Stanton Granite Co., Leicester, was appointed president of the Association for the ensuing year, and Mr. John Faill, of Messrs. A. and J. Faill, Glasgow, vice-president. The retiring members of committee were re-elected, and a special vote of thanks was accorded to Mr. Cousin for his services as president during the past year.

THE CONDITION OF THE BUILDING TRADE.

The condition of the building trade was very truly recorded at the recent meeting of the shareholders of Messrs. Spencer, Santo and Co., Ltd., when the chairman (Mr. H. W. R. Crowle) remarked upon the reluctance of building owners to embark upon new ventures, so that fresh speculations and contract work, especially of a profitable nature, have been exceedingly scarce during the past year or two; and this scarcity of work has meant keen competition for all kinds of public undertakings. So great, indeed, has been the anxiety to obtain business that in many instances works have been undertaken at prices which cannot by any means show profit to the contractor. Mr. Crowle said his company had appreciated the keenness of this competition and had considered it advisable to extend the area of their operations. They had, therefore, opened a building department at Yarmouth, and had succeeded in obtaining a very fair share of the work in that neighbourhood, and this extension in the provinces was a policy which they proposed to continue as suitable opportunities occurred. The new public offices at Westminster, which had been in course of erection by the company during the past six years, had now been practically completed.

Notes and News.

FIRST AID AND NATIONAL DEFENCE.—An ambulance corps and a rifle club have just been started by the employees of the Saxon and Norman Cement Companies at Cambridge.

* * *

A MEMORIAL TABLET to the late Rev. W. J. Scarlin was unveiled last week in St. Anne's Church, Stanley, Liverpool. The tablet, which is placed in the choir, is cast in bronze, and was executed by the Rea Metal Casements, Ltd., of Knowsley Works, Stanley, Liverpool.

* * *

A ROOF PLAYGROUND is a noteworthy feature of the new St. Clement Danes Schools, in Drury Lane, W.C. The accommodation is for 114 infants, 116 boys and 116 girls. Mr. C. W. Reeves was the architect.

* * *

THE REPAIRS TO BARRINGTON COURT, near Ilminster, which, as a beautiful example of domestic architecture of the Tudor period, has been acquired by the National Trust, have been chiefly directed to the strengthening of the roof. The ends of forty-one tie beams and principal rafters which had been built into the walls without space for ventilation, and consequently rotted away, have been repaired and strengthened. One point requiring serious and immediate attention arises from the very limited projection of the eaves and the absence of any guttering to carry off rainwater. This has long collected at the foot of the walls,

to which the consequent damp has done much damage. It is proposed to fix lead heads and down pipes on the front of the house and iron guttering at the back, and some of the lead valleys are not watertight and require renewal. In addition to this work, much remains that it is desirable to do, such as the renewal of floors, or the opening and glazing of some of the many bricked-up windows, and it is hoped that some of this work may be undertaken.

* * *

STATUE OF THE KING FOR OXFORD.—A movement is on foot to erect a statue to the King at Oxford. The site suggested is a piece of ground belonging to St. John's College in St. Giles's.

* * *

THE "FOUR D'S" OF THE TYPICAL SLUM as enumerated by Dr. Arthur Shadwell in a discussion on housing at the Pan-Anglican Congress are dirt, darkness, damp, and dilapidation. The specification is neat, but defective.

* * *

THE STATE PROVISION OF SANATORIA is advocated by the Grimsby Guardians, who are circularising other Boards with a view to the organisation of a united appeal for legislation on these lines.

* * *

THE RECONSTRUCTED BRITISH URALITE CO., LTD., is, we are informed, in course of registration, and is resuming business at 16, St. Helen's Place, London, E.C., where full information may be obtained concerning the firm's fire-resisting building slabs for walls, roofs, and partitions. We wish the new company every success in its enterprise.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Regulations as to Theatres and Music Halls

SIDCUP.—W. writes: "(a) What are the usual powers of the Lord Chamberlain in licensing theatres? (b) What is the official difference between a theatre and a music-hall? (c) What are the requirements of the Lord Chamberlain for the prevention of fire in such buildings apart from those in the London County Council area? These latter, which were published in the BUILDERS' JOURNAL recently, decidedly savour of those of the L.C.C."

In reply to enquiries (a) and (b), the somewhat complex condition of the Lord Chamberlain's power as to theatres, and the official differences between theatres and music-halls, can best be ascertained from the Blue Book issued on the occasion of the Select Committee on Theatres in 1892. Regarding enquiry (c), the information desired can be obtained by applying to the Secretary of the Lord Chamberlain's Department, St. James's Palace, S.W.

Construction of Small Observatory.

PLYMOUTH. — OBSERVATION writes: "Kindly advise as to the chief points that should govern the construction of a small private observatory."

The building should be designed with regard to the size of telescope, circular in plan, with, say, 9in. walls if under 12ft. high, and a rectangular annexe for any subsidiary accommodation. The roof should be domed and self-contained, supported on rollers at the eaves so that it can be easily rotated. One segment of the roof should be free to open to permit the telescope to be elevated. The foundations for the telescope should be separate from the building, and very solid. Illustrations for small observatories have been published from time to time, and possibly the Secretary of the Royal Astronomical Society, Burlington House, Piccadilly, London, W., would be willing to give information with regard to any literature on the subject. The client might also know a friend having such an observatory which the architect might inspect. HENRY ADAMS.

Liability for Dilapidations.

LEEDS. — W.L.V. writes: "On the expiration of a six years' lease, which provides that a house is to be kept and left in good repair, can the landlord claim for a new lavatory basin in place of one that has been cracked, or can he only claim for the depreciation by reason of the crack?"

The landlord can claim merely for indemnification for any damage which has occurred during the late occupation of his premises, whether it has occurred by accident or by improper treatment. The outgoing tenant is therefore only liable for the depreciation in value of the lavatory basin, unless it is so badly cracked that a new fitting is obligatory; either by reason of leakage, or because it is now so unsightly as to render it unacceptable to a reasonably-minded tenant when entering. F.S.I.

Combined Drainage.

ESSEX writes: "Plans for cottages on the combined drainage system have been deposited with an urban district council. It is proposed to collect the rainwater into butts. The council's by-laws do not require same to be excluded from the sewer, although they themselves are very anxious that it should not go to the sewage farm, and fearing that at some future date the rainwater may be diverted to the gully they have refused to accept the combined drainage covenant unless my client undertakes to carry the rainwater to the surface-water drain in the roadway. My client, if he wishes to build, must now provide a separate connection to sewer from each cottage. Have the council power to refuse to accept a combined drainage covenant and thereby force my client's hand?"

An urban district council cannot compel a building owner to provide separate drains for the conveyance of sewage and the rainwater unless they have by-laws to that effect. At the same time they can compel a building owner to put in a separate drain to each house, and they are not therefore obliged to accept a combined drainage covenant unless they please. With the difficulties councils have had to encounter in the past we are not surprised that they view irregularities—or the possibility of future irregularities—in the drainage system with grave concern.

Obituary.

MR. A. E. RHODES, architect, of Lees, near Oldham, died last week.

MR. WILLIAM PERKINS, architect and surveyor, Bishop Auckland, died on June 16th, aged 38.

MR. THOMAS SIMPSON, senior partner in the firm of Thomas Simpson and Son, architects and surveyors, of Brighton, died on June 24th, aged 83. He was largely associated with school work.

Notes on Competitions.

New Schools, Bridlington.

In this competition, limited to local architects, the design submitted by Mr. J. Earnshaw has been selected.

New Hostel, Bangor College.

The design of Mr. Henry T. Hare, V.P.R.I.B.A., has been selected for this building, which is to be erected at a cost of £25,000.

Homœopathic Cottage Hospital, Southport

Mr. R. Norman Shaw, R.A., the assessor in the competition for this hospital, has made the following awards, which have been adopted by the committee: 1st, Messrs. H. Percy Adams and C. Holden, London; 2nd, Messrs. Briggs and Wolstenholme and Arnold Thornely, Liverpool; 3rd, Messrs. Haigh and Thompson, Liverpool.

For Architectural Students & Apprentices.

In connection with the Midland Counties Building Trades' Exhibition, to be held in Bingley Hall, Birmingham, from October 12th to October 21st next, competitions for students and apprentices have been arranged, with money prizes. For architectural students the subjects set are: "Design for workman's house," "Design for ornamental enriched plaster ceiling," "Design for wall decoration," "Example of ornamental art metal work"; while for apprentices there will be competitions in brickwork, plumbing, roofing, clay modelling, and masonry. In connection with the exhibition there will also be a series of lectures, the syllabus of which is now in course of preparation.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
July 4	BRISTOL ROYAL INFIRMARY EXTENSION.—Premiums 200, 150, and 100 guineas. Limited to Bristol architects and to 12 outside architects. (Mr. Edwin T. Hall, assessor.) Architects desirous of competing must send in their names by this date, together with list of works carried out from their designs. Conditions from W. E. Budgett, Secretary and House Governor, Royal Infirmary, Bristol. Deposit, £2 2s.
July 13	EXTENSIONS TO WORKHOUSE BUILDINGS, DUDLEY.—Limited to architects practising within 35 miles of Dudley. Conditions from G. W. Coster, Clerk, Union Offices, St. James's Road, Dudley.
July 31	ELEMENTARY SCHOOL AT BANBURY.—Conditions from Oliver J. Stockton, Town Clerk, Banbury. Deposit £1.
Aug. 1	COUNTRY HOSPITAL, GUERNSEY.—Conditions from Thomas Robin, President of Directors of Country Hospital, Castel, Guernsey.
Aug. 7	SECONDARY SCHOOL AND TECHNICAL INSTITUTE AT CLECKHEATON (150 places).—Premiums £50, £30, and £20. Particulars from J. H. Linfield, Clerk, Town Hall, Cleckheaton.
Aug. 31	PARISH CHURCH AT BISHOPSWEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Road, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
No date.	SITE PLAN FOR COTTAGE EXHIBITION, SWANSEA, 1909.—Gold, silver and bronze medals, with prizes of £25, £15 and £10. Particulars from Henry R. Aldridge, 7, Gower Street, Swansea.
No date.	NATIONAL LIBRARY BUILDINGS, ABERYSTWYTH. — Architects desirous of competing should send designs and photographs of libraries, or similar buildings erected under their direction, to J. E. Davies, Hon. Secretary, National Library of Wales, Aberystwyth.

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY).

Fire Risks and Exits in Public Elementary Schools.

The Board of Education have issued the following circular to the local education authorities:—

"The Board of Education have recently had their attention called to the practice which prevails at certain schools of locking the external doors during school hours. In view of the loss of life which has occurred in several cases of panic in public buildings, and which has been caused or increased by the inability of the occupants of the buildings to obtain a ready exit, the Board desire to urge that the following principles should be adopted in all public elementary schools at the earliest possible date:—(1) External doors of schools should never be locked while children are in the building. Any protection that may be considered necessary in populous districts for the contents of cloakrooms, etc., should be provided by means of separate locked doors to those rooms. If it is necessary that the external doors should be closed against intruders, this can be done in the majority of cases by the adoption of some form of 'panic-bolt.' (2) External doors which swing only inwards should be altered to swing outwards as well if possible. This measure must be regarded as absolutely necessary in the case of a door at the foot of a flight of stairs or at the end of a long passage. The Board of Education will instruct their inspectors to pay special regard to the observance of these principles in reporting on public elementary schools."

The Fire Insurance Business of British Companies.

A most interesting statement appeared recently in the "Post Magazine" giving the fire-insurance business done by British companies during 1907, and the extraordinary turnover in insurance premiums obtained throughout the world. Unfortunately, in dealing with the subject no discrimination is made between the premiums obtained in Great Britain and abroad, or the losses paid in Great Britain and abroad. If such statements were made, as they should be, by legislative requirement (as they are in all other civilised countries), it would soon be seen that, generally speaking, the insurance premiums charged in Great Britain are excessive, except in respect to certain special risks and certain dangerous areas. As a matter of fact, the British insurer resident in Great Britain has to pay in his premium a very substantial amount towards the expenses and losses incurred by British companies insuring British and foreign property abroad. Fortunately in this country we do not have such conflagrations as those of Baltimore, Toronto, and San Francisco; nevertheless, it is the British insurer who contributes substantially towards the losses incurred in countries prone to such large fires. Insurance rates abroad may be high, but they would be materially higher if the amounts which ought to be paid were levied in those countries instead of being extracted from the insurer resident in the better protected areas of Great Britain.

Fire prevention and the fire service in this country have done a great deal to reduce fire loss throughout the Kingdom. Authorities state that the actual reduction of loss during the last ten years has been millions sterling. It is quite time that British insurers should awake to this fact, and demand from the insurance companies a substantial reduction in the rate of premiums; in other words, they should refuse to contribute towards the loss incurred by the foreigner abroad. It is hoped, however, that the good sense of the British insurance companies will lead them, voluntarily, to make some reductions in their charges at home, otherwise they will only be inviting the competition of newly-formed companies, who announce that they will not do business in such dangerous areas as those of the United States. It is also time for the British companies to discriminate in a more liberal manner between buildings that have really the attributes of a fire-resisting character, and those of no fire-resisting pretensions, even if the former do not comply precisely with the letter of the private regulations laid down by the Fire Offices' Committee.

Powder Fire Extinguishers.

The British Fire Prevention Committee are now undertaking certain systematic tests with powder extinguishers, and we look forward to these tests as at least providing us with reliable data. In our opinion, powder fire extinguishers should be regarded as supplementary appliances to those in which water is used: their primary utility is in connection with small spirit fires. They should not be specified as *sole* first-aid appliances. Where hand-pumps and buckets are available, or where fire extinguishers using either pure water or chemically-treated water are used, there is no reason why powder extinguishers should not also be supplied as an additional safeguard in the case of these spirit fires, which are on the increase since the advent of the motor-car; but it is entirely wrong to rely solely on powder extinguishers without having made provision for first-aid water-extinguishing gear.

Roof Fires.

One of the most remarkable series of incendiary fires which, we believe, have ever occurred is taking place in the roofs of tenement houses in Berlin. An official report on the subject shows that from February 10th to April 30th this year there have been no fewer than 153 roof fires in the German capital, as against 21 in 1907, and in more than 120 of these cases the fire has been due to incendiarism. Since April 30th the series has continued, and only last week the daily Press reported that one person had been arrested on suspicion of being connected with 29 of them. Yet even such incendiary fires as these have their uses, for we understand that a publication will be issued in regard to the effect of fire in roofs as taught by this very extraordinary series.

Gas and Water Cocks.

The Berlin Police have issued a circular requesting all householders to paint up in a conspicuous position inside their front doors, a notice (or, in the better class of houses, to put up brass plates with an illustration or diagram) indicating the position of the principal gas and water cocks in the building, and the quickest way to get at them. This is certainly most useful in houses which are locked up at night, such as offices, office blocks, shops, etc., and it is a matter that deserves attention in this country.

THE FIRE DANGERS OF THE TALL STEEL-FRAME BUILDING.*

By A. Pordage, Firemaster of Edinburgh.

The subject to which I now direct attention is one which does not receive from communities that consideration which its importance would seemingly justify, but is one, nevertheless, which does seriously concern the officials of the fire brigades in most large cities. I refer to the decided tendency which exists for increased elevations of new buildings, and more particularly the introduction into this country during the past few years of the steel-frame buildings to which the mythical legend "fireproof" is specially dedicated.

I trust the meeting will agree that the springing up of the new steel-frame building of mushroom growth during recent years renders the time opportune for this Association to issue a warning note to municipalities of the dangers to which cities are exposed where the construction of such buildings of abnormal heights is encouraged.

The First Query

for us to consider is: "Are these fireproof buildings fireproof?"

We have no need to revert to an hypothesis for our answer. The calamitous fires in large American cities during the past few years have provided the world with the most complete object-lesson on the behaviour of the various buildings and building materials when exposed to the ravages of a conflagration, and I propose to take the fire at Baltimore in 1904 as the one from which we can find circumstances which more closely resemble those we should find in our own cities, namely, a city consisting of many large and important and substantially-built structures of varying dimensions and altitudes, of various composition, comprising the stone building, the brick building, and steel-frame building of moderst dimensions, and that kuown as the sky-scrape:

We know that building materials which are not of a combustible nature do not alone render the structure one which will resist the ravages of a fire.

*A paper read at the meeting of Professional Fire Brigade Chiefs held at Birmingham on June 18th, 1908

The Important Matter of Contents.

An important factor which is almost entirely ignored by the building community is that, no matter of what material the structure may consist, its contents cannot be of the same incombustible nature as the building material. One often hears it said of a building that "the floors are of concrete, the stairs are of stone, and there is therefore nothing to burn." It is quite impossible to "fireproof" all the necessities of life with which buildings are more or less stored, the housing of which is the chief function of every building. It is also not necessary that the building should be of non-combustible construction alone to prevent the stock taking fire. The stock of almost every description has an unhappy knack of taking fire under whatever conditions it may be stored. We have no desire to disparage the construction of buildings with non-inflammable materials, but what we do desire is that all buildings should be within a reasonable distance from the ground. The danger of extremely high buildings lies in the fact that fires in the upper floors are quickly communicated from one building to another, and, owing to their great height, are out of reach of the ordinary equipment of our fire brigades.

Limit of Height.

The Chief of the New York Fire Department has declared that his department cannot deal with a fire higher than 150ft. from the ground. In this country we do not claim to deal even with such modest proportions. It is apparent to everybody that if a fire is to be stopped, it must be got at as quickly as possible. This can only be accomplished if the fire is within reasonable reach of the fire-brigade's resources. I have no hesitation in saying that the limit of our immediate resources is 60ft.; and even with the aid of modern mechanical ladders 80ft. may be considered to be the extreme limit of the immediate possibilities of the best-equipped fire brigade; the reason being that the first appliances to be brought up and got into operation could not reach the seat of a fire beyond those limits without the assistance of heavier and more complicated appliances which require a longer time to bring up and several men to manipulate them; during these heavier operations the fire has time to increase in intensity in the building, rendering it unapproachable to the firemen, who consequently have to attack it either from the street or adjoining buildings, to which the fire has every opportunity of spreading through windows and other unavoidable openings.

The lessons to be learnt from some of the more recent American fires are that whilst the Fire Department were successful in extinguishing the fires in the older and less pretentious buildings, and in the lower floors of the sky-scrapers, they were quite unable to reach the fires in the top floors of the latter buildings.

From the investigations made at the instance of the United States Government it was proved that the wave of flame travelling with the direction of the wind entered the one side of the taller buildings, passing out at the other, jumped the space over the lower or normal-sized building, and thus travelled unimpeded from one tall block to another, in many instances the smaller buildings escaping with but slight damage.

It is thus shown that the so-called "fireproof" frame building is not only not "fireproof," but while it is used for storing goods, or as the receptacle for office and domestic furnishings, it really becomes a fire conductor. The important contributing factors to the spread of the fire were the large wall openings filled with glass, and the internal floor openings.

Openings.

The buildings being skeleton in form, every advantage is usually taken of the extensive openings for light. This is a most important factor, because it is one which is being largely taken advantage of in this country. I have seen frame buildings with absolutely nothing but glass between the piers supporting the upper floors, which it is quite impossible to protect by shutters or any portable covering. There have always been high buildings in most towns, but the same liberties in the way of openings and glass roofs have not been indulged in with the older brick building as with the new construction.

We have no desire to disparage the value and use of fire-preventive materials in building construction; on the contrary it is our duty to encourage them; but it is also our duty to prevent an over-estimation of the value of such construction from becoming an abuse. What we as a fire-brigade congress have now to consider is "How to prevent the destruction of firerpoof buildings by fire."

Hotel Buildings.

As applied to hotel buildings and habitations, these lofty structures are a distinct source of danger to life, as it is quite impossible for any brigade to bring up life-saving appliances to deal effectively with a large number of people on the top or upper floors. With all the precautions in the way of fixed fire escapes which the American building laws insist must be introduced in hotel and other such buildings, and with the splendid resources of the American fire brigades, there is seldom a serious fire in American hotel buildings which is not accompanied by serious loss of life upon the upper floors, owing to the inability of the firemen to reach such extreme elevations. Consequently, we can only view with much concern the introduction into this country of such conditions as are inseparable from this class of building. And the consequences with us would be even more disastrous, because the resources at the disposal of our fire brigades are not nearly so elaborate as those of the American cities.

Taking the structures apart from the contents at the Baltimore fire in 1904, most of the frame buildings which were burned out, in so far as the contents and fixtures were concerned, and whose skeleton frames remained, cannot be said to have behaved satisfactorily. The top floors which were inaccessible to the fire-fighting appliances acted as fire conductors, and their stone and ornamental dressings were stripped by the effects of the heat, making the work of the firemen below extremely hazardous. An extract from the report of the Chief of Engineers of the United States of America says:

"The exterior walls of many of the so-called fireproof buildings ought to be taken down; all of them are more seriously damaged than appears.

"Of materials used in exterior walls, properly bonded brickwork was the only thing that was really successful.

"The only successful partitions were brick walls which lost the plaster, but were otherwise undamaged."

Nothing can convey more clearly the value of the fireproof construction in a fire than one of the quotations contained in the conclusions of the Special Committee of the National Fire Protection Association of the United States of America, which says:—

"It may be expected that in fires of great severity the steel frame, its protective covering, the walls and floor arches alone will remain, and even these will be more or less damaged according to the character of the construction and materials used.

"The contents of a fire-resisting building, without proper sub-division and no adequate protection against exposing fires, are scarcely any safer as regards destruction by fire than if contained in a building of ordinary construction."

These conclusions, arrived at after careful and exhaustive enquiry into the results of the various building constructions, prove conclusively that the tall frame-built fireproof building is

a Menace

to the commercial centre of any city.

This particular frame construction has received considerable favour from the architectural and building communities in this country because of its having withstood certain tests in the recent great American fires. That is to say, the frames of the structures were not consumed, but those which did not collapse in many instances buckled out of the plumb, whilst only the structure of others was intact. But what became of the contents? The American reports say that in every instance they were wholly destroyed.

Considering these facts, it is remarkable for this congress to note that it is only since the great American fires that this class of structure has been pushed ahead in this country. What has already happened in the American cities may happen again in the next conflagration, and may also happen in similarly built areas in this country.

If there is one fact that condemns this particular class of building more than another it is the rapidity with which the fires have spread in the modern-built American cities. In former years the destruction of American towns was due to the timber construction of its buildings; but the remedy, in so far as it has been applied to the "fireproof" building, has proved to be worse than the disease.

One disadvantage which the frame building usually suffers is that of being run up against time, which gives great scope for faulty construction and the introduction of defects which, owing to the delay the undoing and remedying would occasion, are allowed to pass consequently the building fails in the test which otherwise it would have withstood safely.

The report of the National Fire Protection Association says, in respect to the checking of the fire at one particular part of the City:—

"The firemen were assisted by a comparatively wide street and by the fact that a solid brick wall as well as fire shutters on windows, which enabled them to save about half of this block.

"A dry goods store at the corner of Lexington and Charles Streets was seriously exposed, but was protected

against the worst attack by a solid brick wall on the south."

I think I have shown that the introduction of the steel frame building into this country is a matter which should not be ignored by the building committees of the various municipalities. When they exceed the normal dimensions they must be considered as a fire risk, whether the contents be of ordinary or extraordinary combustible stock.

Where several high-frame buildings, with open sides, are in close proximity to one another they must be considered as an extraordinary fire risk.

A discussion followed the reading of the foregoing paper, and a resolution was adopted directing the attention of building committees of municipalities to the danger of lightly-constructed lofty steel-frame buildings with large openings in congested areas.

THE DESIGN OF BUILDINGS IN REGARD TO LOSS OF LIFE BY FIRE.

At the recent Life-Saving International Congress held at Frankfort, a considerable debate took place as to the precautions which should be adopted in buildings, and the facilities that should be afforded to the fire service, for the saving of life in case of fire.

We present in full the resolutions on this subject that were passed.

The Congress was of exceptional standing, and it is gratifying to record that Great Britain was not, as at the International Congress of Architects at Vienna, conspicuous by the emptiness of its official chair. No fewer than three public departments and practically every institution and society concerned were formally represented, and the British spokesman at the official opening was an Assistant Under-Secretary of State.

The resolutions set out below recall the grievance of the fire-brigade officer that building regulations do not fully accord with the requirements of rescue work at fires. We observe that these resolutions perhaps have greater bearing on the condition of affairs in capital cities, and particularly in big Continental cities; but nevertheless, they should serve as a useful guide to those who have the framing of by-laws and building Acts in all countries, for they point to the direction in which there is weakness in our legislative enactments from the practical fire point of view.

The tall building is with us, and in Liverpool, for instance, it would appear that it will practically become the sky-scraper. The value of ground in cities is so rapidly increasing that every available inch is utilised for building purposes, and the courtyard or area is limited to the minimum of hygienic requirements.

Difficulties of all kinds beset the fire brigade when a fire breaks out in buildings of the height of, for example, certain buildings in Holborn, or in the congested areas of the West End and the City of London.

New conditions of building make life-saving work more difficult every day than it has hitherto been, and facilities will have to be gradually accorded in order to make life-saving and rescue work possible. Courtyards in which no fire-escape or ladder can be raised, and no jumping-sheet spread, are death-traps; courtyards with no exit to the public thoroughfare are veritable prisons; courtyards with glazed roofs covering some palm-court or similar decorative feature of the building are becoming a serious menace; and altogether the problem of the courtyard and the area have become matters of moment where life-saving is concerned.

We will not deal with these points in detail, for they explain themselves to a very great extent. The only thing we should add is that architects in their work should endeavour to be in advance of building regulations, and should give thought to the possibility of dangers arising from fire when planning their buildings, even if the local by-laws or regulations do not specifically demand such safeguards.

Resolutions Passed at the Frankfort Congress.

I. In the drafting of new building regulations, suggestions from the Fire Service should be invited and considered, and in sanctioning of new structures for the carrying-on of manufactures, etc., such buildings must be planned and erected according to the risks they are to contain, especially if they are to serve the purpose of a manufacture specially dangerous from a fire point of view, or to serve as structures in which a number of persons are to work or dwell.

II. The following points call for special attention in the interests of public safety from a structural and fire point of view:—

(a). The entrances or thoroughfares into courts and yards of buildings should accord with the requirements of the local fire brigade, and vary according to the depth and height of the buildings facing on to such courts and open spaces.

Size of Courts and Internal Areas.

(b). All open spaces to buildings (such as courts) on to which windows of rooms on upper floors face should be of such dimensions as to give ample room below the windows for spreading a jumping sheet and to enable fire-escapes to be put up. These dimensions should be in accordance with the requirements of the local fire brigade.

(c). In so far as the courtyard of a building is to serve the above-mentioned purpose in case of fire, nothing which would be an impediment to the application of fire-escapes should be permitted. The following should be considered obstructions in case of fire, *i.e.*, unprotected openings in the ground of more than 30 cm., in depth, excavations, enclosures, and the like, of a greater height than 30 cm., even though they may be erected at right angles to the fronts, pipes, or wire running across the court or area.

Size of Windows.

(d). All rooms to be used as permanent dwellings should have at least one window, of which the actual window pane is 50 cm. wide and 80 cm. high. This window should be easy of access. Gratings should only be allowed if special sanction has been obtained by the local authorities controlling the erection of buildings. Skylights should only be allowed where they are required for a special purpose. Where skylights alone are used, proper means of escape must be provided for the persons employed in the room in question, and proper ventilating devices should be fixed.

Balconies.

(e). The use of balconies outside windows of rooms on upper storeys which serve as dwelling rooms should be advocated, as they form a means of retreat in case of fire, but they should not project more than 50 cm. beyond the front of the building (including mouldings). These balconies must, however, be so constructed as not to be a hindrance to the fire brigade in its work of saving life.

Staircase Walls.

(f). Endeavours should be made to advocate that all walls of staircases going up to roof level be brought over the roof to act as fire-resisting walls. Walls serving as containing walls to staircases should not have any other openings beyond those which serve as means of ingress and egress to the rooms at the different levels, and the windows which light the staircase.

Stairs leading to basements, cellars, etc., should be divided from the main stairs in a fire-resisting manner. All main staircases should be provided with efficient means of ventilation which can be brought into play on all floors, or closed off if desired.

In the case of staircase walls, a height of 2 to 3 m. in excess of other parts of a structure should be permissible where efficient ventilation arrangements are provided, and where they include such openings on to roofs as will serve as a means of emergency exit in case of fire.

(g). From the sanitary as well as from the fire-protective point of view, it should be endeavoured, when erecting new buildings, to avoid shaft-like areas or courts, which in the event of fire retain the smoke, and thus all open spaces in a building block should communicate with one another by means of passages of not less than 4 m.

ESCAPE FROM FIRE.

Report on Plymouth Buildings.

The Plymouth Watch Committee recently held a special meeting to consider the desirability of making by-laws under Section 15 of the Factory and Workshops Act, 1901, with reference to the provision of means of escape in case of fire from factories and workshops in which fewer than 40 persons are engaged; and also to consider the report of the Chief Constable dealing with the inhabited business premises in Plymouth, the upper portions of which could not be reached by the existing fire escapes. In regard to the former matter, copies of the Model By-laws issued by the Local Government Board had been circulated among the members, and it was stated in respect to premises where more than 40 persons are employed that the Council already have power to deal with them under the Factory Act. The committee directed the Chief Constable to enquire and report at the next meeting as to the number of factories and workshops which would be affected by the proposed by-laws, and adjourned the further consideration of the question until then.

The Chief Constable's report referred to showed there were six business premises in Plymouth, occupied by twenty-nine persons, with upper storeys which could not be reached by the fire escapes. In regard to five of those cases, the committee decided that, having regard to the condition of the premises, no action on their part was necessary, except to call the attention of the owners of the properties to the matter, so that they might make such special provision as they should deem expedient. In the case of the other property, Mr. Sowerby was instructed to interview the owners and report again at an early date.

FIRE PROTECTION IN SCHOOLS.

By Chief Officer Westphalen
(Vice-President, International Fire Service Council).

During the first quarter of this year no fewer than 42 schools have been damaged or totally destroyed by fire in the United States. Of these, and the lessons to be learnt from them, I desire to draw attention particularly to the fire which occurred in March at the school house in Collinwood, near Cleveland, Ohio, when more than 100 children lost their lives.

The building was a comparatively modern one, with well-built external walls and interior partitions, but the floors were of wood joists, with wood laths, and plaster soffits. There were class-rooms on the ground floor, first floor, and top floor, access being given by a staircase with a landing on each floor. The ground floor was 14 steps above street level. The lobby (or hall) had a main entrance door (double), and also a single door to the playground, both opening inwards; and at the time of the fire the playground door was locked, while one wing of the double (entrance) door was bolted. In the basement were heating apparatus, cloak-rooms, lavatories, etc. The fire broke out in the basement and the smoke and flames rising up through the building caused a panic. The children in the ground-floor class-rooms were got safely away, but those on the upper floors crowded on to the staircase, and fell over one another, blocking the exits, with the terrible result recorded above.

This catastrophe in America caused the authorities in many towns in Germany to investigate matters; Hamburg especially considered the matter in detail. Naturally, in addition to the more modern State schools, we have a number of older school buildings and private (voluntary) schools (especially those schools intended for girls) in which the upper floors are also used as living rooms, and there is no doubt that in the event of fire a number of these schools would be extremely dangerous. Where such buildings are still in use in Hamburg, the following rules have been laid down:—

The Hamburg Rules.

1. The building shall be fire-resisting as far as possible.

2. All doors of rooms in which a number of pupils are gathered together for school festivities, etc., and all external doors, as well as the doors of physics and chemistry class-rooms, shall open outwards. In the event of any of these doors being two-winged doors, the closed wing shall be fastened by means of the theatre safety bolt (panic bolt). The doors of the classrooms shall, as a rule, open inwards. Doors with glass panes are to be avoided as much as possible, and in rooms used for physics and chemistry glass panes shall be absolutely forbidden. In these last-named rooms there must further be at least one exit in such a position that in the event of a fire breaking out through an experiment at the experimenting table this exit shall be available.

3. The exit stairs and corridors must have a width according to the number of people in the building; as a rule, 1m. width should suffice for every 120 pupils.

4. It should be the endeavour to have at least two safe routes of exit from every floor. In schools where there are more than 250 pupils on the upper floors a second staircase should be provided.

5. The stairs shall be of fire-resisting material, wherever possible. Where wooden staircases are still tolerated, these should be treated on their under side with some fire-resisting material to the satisfaction of the fire brigade.

6. The stairs are to have balusters on both sides, which, in the case of winding staircases, shall be continuous as far as possible. Where staircases exceed 2.50m. in width a centre rail is to be provided.

7. Store cupboards shall not be permissible under staircases.

8. Corridors shall not be blocked by children's clothes. Hat pegs and umbrella stands must be fixed and immovable. Stairs and newels are not to be used for the hanging-up of clothes.

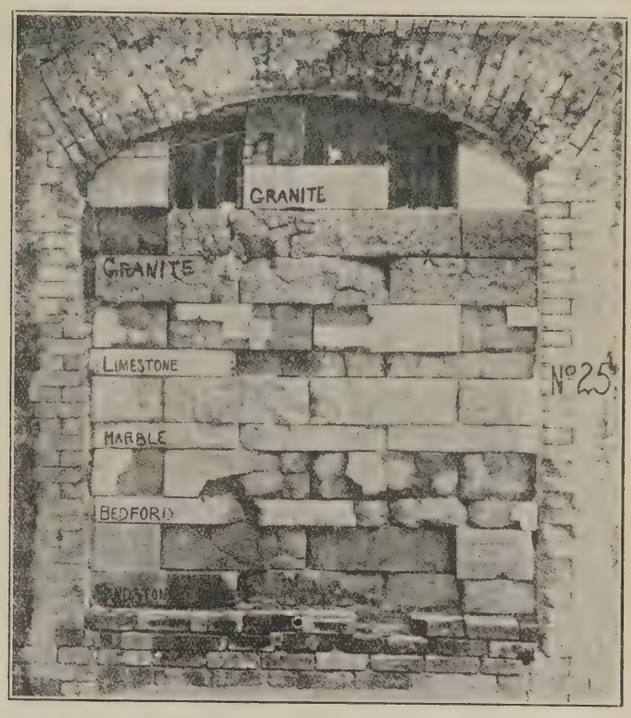
9. All cellars or basement rooms, in so far as they contain fire risks, must be closed off in a fire-resisting manner from the staircase walls.

10. For the storing of all waste paper, rubbish, etc., specially fire-resisting rooms should be provided.

11. A good system of heating should be provided, and should be worked from a smoke-proof heating chamber shut off from the other parts of the building. This is preferable to heating with the aid of stoves or fireplaces.

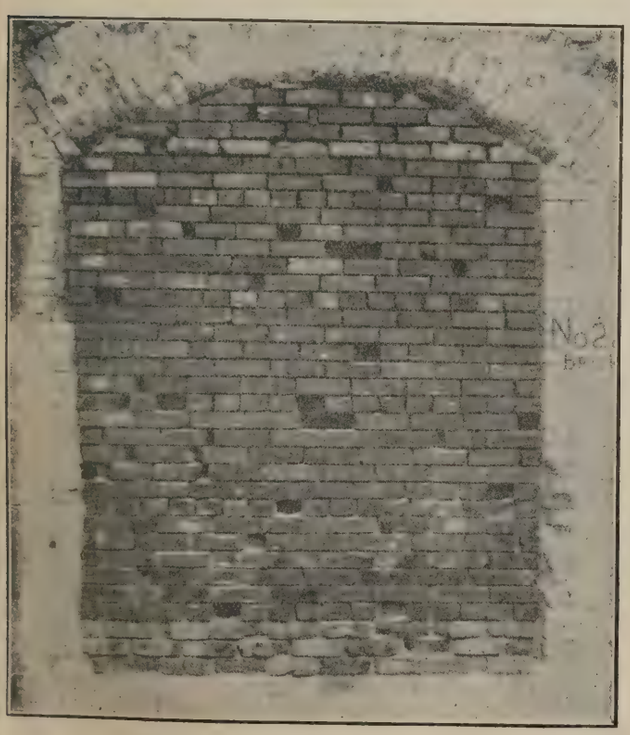
12. For lighting purposes, gas and electricity should be given preference.

FIRE AT DUBLIN. *Photo: Lafayette.*

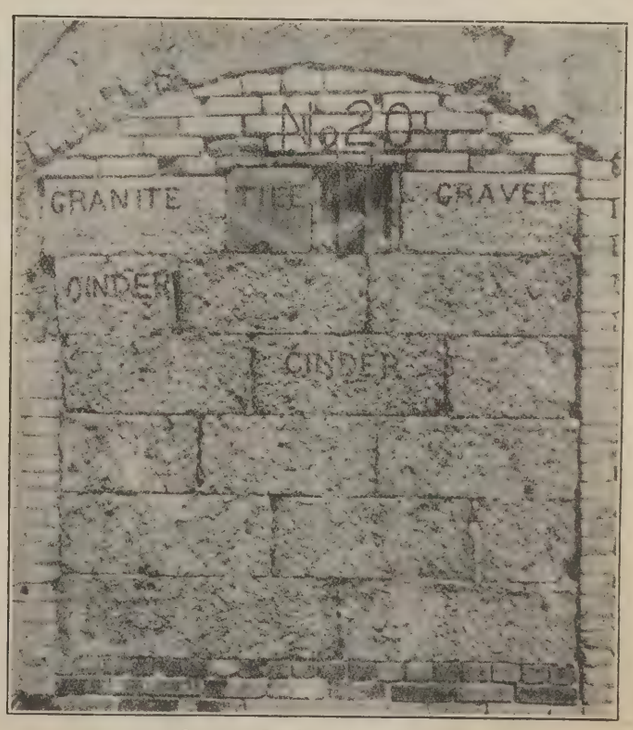


Dublin has been subject to a series of serious fires of late, among which the one illustrated above was an object-lesson as to the fire-resistance of timber baulks, as will be seen from this view, showing the charred beams carrying brickwork.

THE FIRE-RESISTANCE OF CONCRETE.



"The Cement Age" for June—one of our American exchanges—is devoted to the consideration of concrete as a fire-resistant. We are quite aware that our contemporary has its interest centered on concrete, and views concrete successes with every favour. At the same time, one cannot disregard the many proofs of the excellent fire-resisting character both of concrete and reinforced concrete, and we think it interesting, therefore, to give a summary of the chief contents of the issue in question. We reproduce also four illustrations of some most interesting tests which were conducted under the direction of the United States Geological Survey at St. Louis. These speak for themselves. It will be seen that the opening was filled with blocks of different materials—granite, limestone, marble, brick, sandstone, hollow tile, and concrete, and each was subjected to the same conditions, namely, a fire of two hours' duration at a temperature of 1,700 degs. Fahr., followed by the application of water. It is well known that marble and stone generally are liable to burst under fierce heat followed by water, and the accompanying illustrations simply emphasise that fact. The brick, it will be seen, has stood the test very well, and the concrete especially well. The hollow-tile blocks which are shown appear to have suffered very badly, but in connection with them it should be mentioned that these were of hard tile, which, as regards fire-resistance, is very different from porous tile, the latter being a better fire-resistant.



Granite.

Various Building Stones and Hard Tile.

Brick.

Concrete, Granite and Hard Tile.

In each case the temperature was 1,700 degs. Fahr., maintained for two hours, and followed by the application of water.

FIRE TESTS ON BUILDING MATERIALS CARRIED OUT IN THE ST. LOUIS LABORATORIES OF THE UNITED STATES GEOLOGICAL SURVEY.

Before a scientific body a year ago, Prof. Woolson read a paper dealing with **the low thermal conductivity of Concrete,** which, in plain terms, means that it requires a long time for heat to penetrate concrete. His experiments upset the conclusions of the opponents of concrete and revived the enthusiasm of its advocates.

The extreme importance of the announcement made by Professor Woolson was scarcely realised at the time. What it really meant may be made clear when it is stated that while a small concrete cube may disintegrate in the laboratory furnace when entirely surrounded with heat, a concrete block or thick coating of concrete may be subjected to a fire of 1,700 degs. Fahr. for two hours and will remain comparatively cool on the side not exposed to fire. This also means that the application of water is followed by a mere surface disintegration.

Thus it was suddenly realised that here, after all, was the ideal, the perfect fireproof material. It meant a protection to columns which would be maintained for hours under stress of both fire and water, at least a sufficient length of time for the ordinary fire to burn out before the concrete would become heated throughout. It also meant extreme economy in the application of fireproofing as to first cost. It meant conservation of space in column construction and cheap and quick restoration of the fireproof coating in case of surface disintegration.

Moreover, concrete has proved to be not only an admirable fire-resistant, so far as heat penetration is concerned, but possesses a most fortunate and remarkable quality making for the preservation of buildings, namely, equal expansion with iron and steel.

Concrete Partitions.

Prof. Woolson contributes the following in regard to concrete partitions :—

One of the important features of a really fireproof building as constructed according to the best building regulations at present is the character of the partitions built. Next to abolishment of all unnecessary vertical openings between the floors of a large building and the proper protection of such openings as are strictly necessary, there is probably no one feature of a building which will contribute as much to arresting the spread of flames and preventing complete destruction of the building as strictly fireproof partitions.

Such partitions to be effective fire stops must be so constructed that they will stand two or three hours of fierce fire without collapse from expansion or calcination, and at the same time be able to withstand the shock of a stream of water from a fireman's hose shot through some street window or doorway. A solid party wall between buildings is the best possible barrier against the spread of a fire from building to building, and a properly constructed partition should be just as effective a barrier to the spread of a fire from room to room on the floor of a single building.

It is the rankest kind of folly to put carefully constructed fire-resisting floors in a building, and then allow the use of partitions that are fireproof in name only, or at least will offer only small resistance.

A Question Frequently Asked

is whether a strictly fireproof partition can be built which will be comparatively inexpensive and not exceed three or four inches in thickness. My answer is emphatically, Yes. I have the proof of my positiveness in the end walls and roof of one of my fire test buildings, which has been used for testing partitions about three years. This building is approximately 10ft. by 10ft. by 14ft. in size. It has four large chimney flues—one in each corner of the flat roof, and is supplied with draught openings at the bottom and a grate floor upon which the fire is built. The building has a steel frame and the side walls are removable. They are built for each test and are constructed of the partition-material under investigation. These test partitions are therefore 10ft. by 14ft. in size and constitute the temporary side walls. A test for such partitions consists in building a dry cord-wood fire on the grate and bringing the temperature gradually up to 1700 degs. Fahr. in half-an-hour; then maintaining an average temperature in the building of 1700 degs. Fahr. for half-an-hour longer, after which a stream of water under 30lbs. pressure is applied to the walls through a 1⅛in. nozzle for five minutes. During the time this building has been in use, ten 1-hour tests have been made, and one 2-hour test, or an equivalent of 11 hours of fire, half of which time the temperature has averaged above 1700 degs. Fahr. and the water has been applied at the end of each test as described. During all that time the end walls and roof of the building have never been removed or repaired, except occasional patches of the surface have been given a light coat of cement plaster where roughened by the force of the water.

The walls are 4ins. thick and the roof 5ins. They are still in most excellent condition, and apparently able to withstand a large number of similar tests. They are cracked somewhat, but no flame or smoke has ever gone through them, and they are so firm, it would be difficult to break them down. These walls and roof are really nothing but partitions, and no one can gainsay the assertion that they fulfil the definition of being *strictly fireproof*.

The composition used, was a 1-2-2 mixture of Portland cement, bag plaster, and fine boiler cinders, put on as a thick scratch coat on each side of a coarse sheet metal lath, and finished with a 1-3 coat of cement and bag plaster. No studding or braces were left in the finished partitions. The roof was reinforced with deformed bars.

What Concrete Partitions would stand.

Partitions can be built in this way 3ins. thick, and even 2ins. in less exposed places, and I have no doubt that they would confine any ordinary fire to the room in which it started, without being injured to any serious degree.

I have seen cinder concrete block partitions stand a single hour test very creditably indeed, but it is doubtful if they would withstand repeated tests without repair, or a continuous fire of two or three hours. Their method of construction is not as stable as the monolithic type.

A stone concrete partition would make a good fire resistant; but it would not stand the heat as well as the construction described, besides being heavier and more difficult to erect.

It is probably true that the very remarkable showing made by the partitions in the test house above described was controlled more or less by the fact that, with a single exception, the tests occupied one hour only. It has been conclusively demonstrated that the virtue of concrete as a fire resistant results from its low thermal conductivity. A fire of one hour's duration would penetrate such a partition very slightly. A repetition of the fire for a like period would probably penetrate little if any further, and succeeding tests would have similar effect. It is doubtful if the same walls would stand a continuous fire of such intensity for ten hours; on the other hand, no building would have inflammable materials enough in it to maintain such a fire for that time. It is quite certain they would give efficient service for the length of time it would take to burn out any ordinary building.

GLAZING AND ROOFING SUBSTITUTES.

The disadvantages arising from the employment of glass for windows, its liability to break, its dangerous condition when broken, and its utter rigidity, have long been recognised. The problem, however, has been to devise a substitute which, while being translucent, is unbreakable and flexible. Up to the present no such material, possessing all the advantages of glass with none of its disadvantages, has been discovered, but a very near approach to that ideal has been secured by the introduction of "Duroline," which is again being pushed by the reconstituted company concerned with its manufacture, namely, the New Wire-Wove Roofing Co. (1907), Ltd., of Imperial Road, Fulham, S.W. "Duroline" consists essentially of a web of fine iron wire covered on both sides with a thick varnish, made in various shades of amber and green. It is perfectly waterproof and is unaffected by heat, cold, or steam; it can be bent to any angle without cracking; and it can be easily cut with big scissors, and fixed with nails. It is supplied in sheets (maximum size 10ft. by 4ft.) and weighs only 6½ozs. to the square foot, so that it is very much lighter than glass. It seems to be especially suitable for skylights, for roofs of verandahs, and for windows in huts, factories, and store-houses. When dirty it can be cleaned with soap and water. The cost of "Duroline" is 6½d. per sq ft. The General Post Office are considerable users of this material for their collapsible shelters, so much seen in the streets, and at the Franco-British Exhibition visitors can see "Durolite" fixed in position: it has also been fairly extensively used at the Scottish National Exhibition at Edinburgh. Of a similar character to "Duroline," but an opaque material, is "Carboline." This is a serviceable roofing material which can be used as a substitute for slates, galvanised iron tiles, etc., weighing only 8 ozs. to the sq. ft. It is supplied in lengths 2 ft. and 4 ft., and it costs 3½d. per sq. ft. Other roofing specialities of the New Wire-Wove Roofing Co. are "Karboline"—a special felt which is claimed to be cheaper, stronger, and more durable than ordinary felt (supplied in widths 3 ft. wide and up to 25 yds. in length, price 10d. per sq. yd.), and "Malrine"—a special canvas felt for damp-proofing, slate roofs, etc., also supplied in rolls of the same width and length as "Karboline," and costing 7d. per sq. yd.

THE Association of Municipal and County Engineers held their annual Congress last Thursday and Friday, at Nottingham, under the presidency of Mr. E. P. Hooley, Notts County Surveyor.

ELECTRICITY IN BUILDINGS. II.

By Harold Hastings, M.I.E.E., A.M.Inst.C.E.

(*Continued from page 452, No. 694.*)

The scope of this series of articles does not admit an extensive description of the methods of generating electricity, but it will be of useful purpose to outline the principle employed, since it will render the subject more familiar.

There are three simple experiments which introduce the phenomena utilised, and they can be performed by the reader with great benefit. The first two need simple apparatus costing but a shilling or two, and well worth the outlay. The third requires a sensitive instrument called a galvanometer, which detects the flow of a minute current.

Experiment I.

The apparatus required for this experiment is a bichromate cell of half-pint size, a small mariner's compass (pocket size), a length of 12yds. of No. 18 or No. 20 S.W.G. copper wire lightly insulated (electric-bell wire will do), and a piece of mill-board.

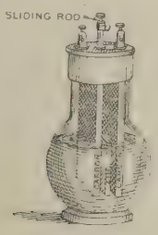


FIG. 4.

The battery will be found to consist of two plates in a glass jar, each plate having a brass terminal to which the wires can be attached. A ¼lb. of chromic acid will be enough for one charge. This should be thoroughly dissolved, and enough poured into the jar to half fill it. It will be noticed that the zinc plate is held at the end of a sliding rod. This is provided so that it may be easily withdrawn from the liquid when not actually in use. It is important to observe this, as the cell is wasting its strength all the time that the zinc is submerged. Chemical action takes place between the zinc and the acid, and sets up an electric current, which flows through the liquid from the zinc plate to the carbon. When the exterior circuit is broken—*i.e.*, when the two terminals are not metallically connected—the return path for the current is through the liquid itself; but when the exterior circuit is complete, the return current flows from the carbon terminal to the zinc one.

To proceed with the experiment, pass the copper wire through the centre of the mill-board and place the latter on the edge of the table, in such a manner that it half overhangs. Rest the cell on the floor under the mill-board and connect the two ends of the wire to the terminals, first clearing them of insulation and making them bright and clean. The mill-board can be held in its overhanging position by placing books upon it, but the success of the experiment would be jeopardised if anything containing iron were used as a weight, or, indeed, placed near the scene of operations.

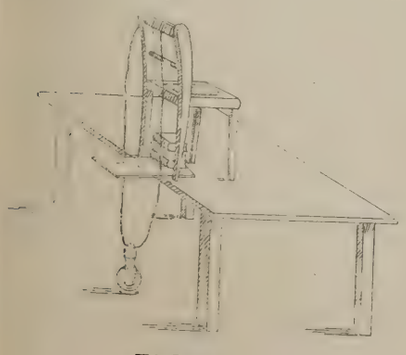

FIG. 5.

The wire must be arranged so that it forms a straight line from the coil to the mill-board, which line is continued for at least 2ft. higher. The top of the loop can be held in position by placing a chair upon the table. The other side of the loop must be opened out, so as to be at some distance from the part passing through the board. Let the compass be placed upon the board close to the wire, and note its position before and after lowering the zinc into the liquid. Move the compass to various positions about the board. It will be found that the current in the wire exercises an influence over the compass which is superior to the magnetic influence of the earth. When the circuit is broken, either by raising the zinc or by disconnecting one of the terminals, the compass resumes its normal north and south position; but during the time that the current is flowing the position taken up is invariably one at right angles to the straight line drawn between its own pivot and the wire which is influencing it.

Not only does the compass hold to the position defined, but, if the position of the north-seeking pole be observed, it will be found to point always in one direction round the circle.

When the current is flowing upwards through the board the north-seeking pole points in a counter-clockwise direction. When the connections are reversed, and the wire passing through the board comes direct from the zinc terminal, the compass

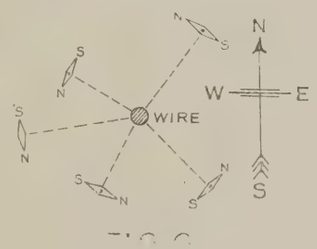

FIG. 6.

also reverses its position, and the north-seeking pole points in a clockwise direction round the wire.

The effect of the current may be increased by adding to the number of wires passing through the mill-board. This is best done by doubling the wire upon itself in such a manner that it passes through the board twice in the same direction. The circles of force which affect the compass exist all along the wire. This is obvious, since we did not choose any particular spot upon the wire at which to carry out the foregoing experiment. If, therefore, two parts of the same wire can be combined to both react upon the compass the total force exerted will be double that of one wire. Care must be taken that the current flows in each in the same direction, otherwise the force exerted by the one would cancel that by the other.

The apparatus should now be arranged as shown in the diagram, and the effects noted. It will be found that the compass responds more readily to the controlling wire.

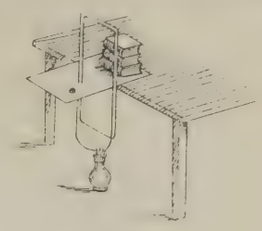

FIG 7.

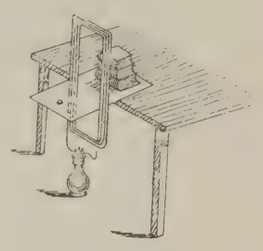

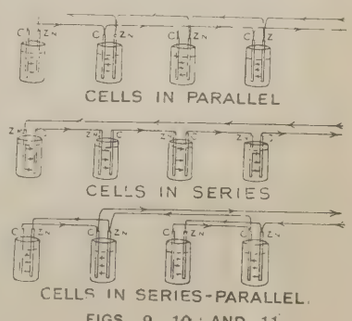

FIG. 8.

By continuing to turn the wire upon itself a number of times, the effect upon the compass may be increased in strict proportion to the number of turns. As the current flowing along the circuit must be of the same amount at all parts of the wire, the effect upon the compass may be said to be in direct proportion to the number of "ampère-turns." This is a term frequently encountered in electrical literature. The area upon which the current reacts is called the "magnetic field" surrounding the wire.

If we had left the single wire passing through the mill-board, we could have magnified the effect equally well by increasing the number of cells and thereby obtaining increased current. Thus, the strength of the magnetic-field, due to any wire conveying a current, varies as its ampères, as well as its turns, and, therefore, depends upon its ampère-turns.

In case the reader would like to obtain further cells and prove that the effect is as we state, we have given diagrams showing how the connections should be made. By connecting all the carbons together, and all the zincs, the output of each cell is added to that of all the rest (Fig. 9), but it must be remembered that an increase in the number of ampères will need a corresponding increase in the number of volts, or else a wire of greater section, and consequently less resistance. Placing the cells, as shown in Fig. 9, is termed connecting them "in parallel," or by some "in quantity," which is perhaps more expressive. By this means the voltage is unaltered, but the current capacity of the cells is multiplied. By placing the cells as shown in Fig. 10 the current capacity remains unaltered, but the voltage is multiplied. A method of increasing both current capacity and voltage is shown in Fig. 11. The coupling together of carbon to zinc, as in Fig. 10, is called

FIGS. 9, 10, AND 11.

connecting the cells "in series," or "in tension." The third method is "series-parallel."

We will now proceed to examine the effect of a wire which passes through the mill-board and returns through it some two inches away. If a compass be placed midway between them, we have seen that the effect of that wire in which the current is travelling upwards is to turn the north-seeking pole in the counter-clockwise direction with regard to its own centre. The effect of the other wire will be to turn it in a clockwise direction. If these two effects be examined with the aid of a diagram (Fig. 12) it will be seen that they re-act upon

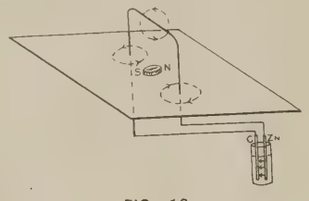

FIG. 12.

the compass in the same sense. As the compass is on the right of one wire and on the left of the other, and the effect of one is the opposite to the effect of the other, it is obvious that the two opposites cancel one another, and the two wires have a combined effect upon the compass.

Examination will show that the horizontal wire connecting the two vertical portions will combine with the rest of the circuit in influencing the compass.

If the number of turns be increased the effect will be increased. By an increase in effect we mean that the influence of the wires will turn a heavier compass, or one having greater resistance to turning. The difference in strength of magnetic field will be evident to the experimenter by the more rapid and decisive movement.

The first experiment has taught us that (1) the space enclosed by a coil of wire exhibits the properties of magnetism, and may be termed a magnetic field; (2) the polarity of the magnetic field is dependent upon the direction of the current through the wires that compose the coil; (3) the strength of the magnetic field is proportional to the number of ampère-turns in the coil.

Experiment 2.

The apparatus required for this experiment will be the bichromate cell and copper wire from the last, and in addition two test tubes (costing about a penny each at the chemist's), some iron filings, a set of cheap photographer's scales, and a few shot.

To set up this apparatus for use, we remove one scale-pan, and, in its place, hang a test tube by a piece of thread. The copper wire is cut into two equal

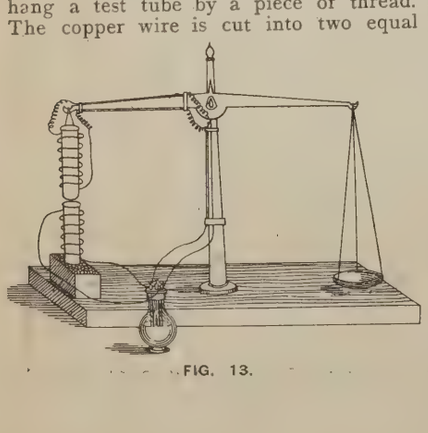

FIG. 13.

lengths, and one piece is coiled closely round the swinging test tube, leaving about one foot of slack wire at each end. The ends are tied along the balance arm and down the centre standard with thread, care being taken to arrange the wires so that they do not impede the freedom of the arm to move, nor the test tube to swing. (In this and all future diagrams only a few turns are shown in the coils for the sake of clearness.) The cell is now stood at the base of the scales and the wires connected to the terminals, the zinc being left out of the liquid for the present. Shot are inserted in the scale pan to just counterbalance the test tube and wire.

The second test tube is now prepared in the same manner as the first—*i.e.*, with the wire coiled round it, and it is fixed immediately below the other. It can be held in position conveniently by standing it in a box of bran, or sawdust.

The wires of this coil are inserted with the others in the terminals of the cell.

The zinc is lowered into the liquid and the effect closely watched. As the current flows round both the coils they create a magnetic field inside the test tubes. These fields either repel or attract one another. By reversing the connections of one coil, the flow of current in that coil will be reversed, and the magnetic fields will exert the opposite force to the former case.

Leave the coils connected in such a manner that they attract one another, and add weights to the scale pan until they just draw apart. Make a note of the amount added, as this is the force of mutual attraction.

Withdraw the zinc from the liquid and fill both the tubes with iron filings. Take the weights from the scale pan, and add more shot until the balance is again adjusted. Re-insert the zinc and measure the force of attraction again. It has increased enormously. Compare the two results.

The only alteration that has been made is the addition of iron filings.

Reverse one of the battery connections as before explained and obtain repulsion instead of attraction. Remove the weights from the scale pan and add them to the swinging test tube. It will be found that balance is regained.

From this experiment we have learnt that (1) magnetic fields attract or repel one another according to their mutual polarity, (2) the force of attraction is equal in strength to the force of repulsion, when the rest of the conditions are unchanged, (3) the value of iron as a magnetic medium is immensely greater than that of air.

Experiment 3.

The apparatus required for this experiment consists of a bar of soft iron, ½in. sq. by 4ins. long, ½lb. (nearly a mile) of No. 38 S.W.G. double cotton covered copper wire, a needle, a piece of cork, some cardboard, some liquid glue, black tape, and a shallow dish of water.

The bar of soft iron must be magnetised. This can be done by coiling round it the wire discarded from the last experiment, connecting the cell to the ends and leaving it for a quarter of an hour. After this it must always be handled gently, as it would become demagnetised if dropped or subjected to any sharp blow.

The needle has also to be magnetised, which can be done by stroking it with the magnetised bar, always using one end of the bar and stroking only in the one direction, from the eye to the point. The needle should be treated in this manner for at least five minutes. When it has been magnetised, it should be passed through a thin wafer of cork, just enough to keep it clear of the water in a horizontal position. The dish should be just large enough to allow the needle, as carried by the floating cork, to turn freely in any direction. The needle will, of course, point north and south, and is now a compass with a delicate form of suspension.

Take the No. 38 wire and wind nearly half the amount from the reel on the hand. It should be wound somewhat loosely so that it can be easily slipped off. When a neat coil has been thus formed it should be taped over with narrow black tape to hold the convolutions in position. A cardboard stand has to be made, so that the coil may stand in a vertical position, with the dish of water, containing the needle, inside it.

The complete apparatus thus formed is called a "galvanometer." It is used in such a position that the needle when at rest, pointing north and south, lies parallel with the convolutions of the coil. The magnetic field produced by a current flowing through the wire will set up an influence at right angles to the magnetic

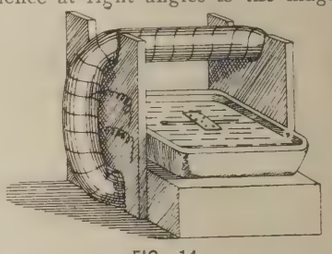

FIG. 14.

field of the earth. The number of turns is so great that even a minute current will represent a large amount, if expressed in ampère-turns. It serves, therefore, to detect any very small currents that may be obtained. The principle of its construction is of great interest, as most measuring instruments in electrical work are adaptations and variations thereof.

To proceed with our experiment, the galvanometer must be connected to the remainder of the wire on the reel. In making any electrical connections it is most important to see that the ends of the connecting wires are bare of insulation, perfectly clean, and tightly twisted together in such a manner that they touch over as much surface as possible.

When the two ends of the galvanometer coil have been joined to those of the reel, take the magnetised iron bar and place it inside the hole in the reel. Withdraw it sharply and watch the needle while doing so. It swings violently, indicating the flow of a momentary current. When the needle is again at rest, bring the bar quickly back to the end of the reel. The needle again swings. Place the galvanometer at one end of the room and the reel at the other, and the same

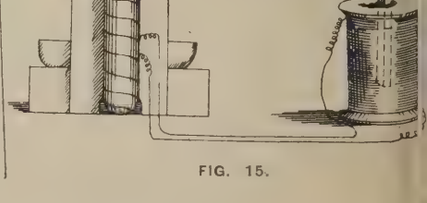

FIG. 15.

:sults will be obtained. Someone will ave to assist in this, but it will prove iat the swing is not due to an attraction etween the bar and the needle. It will e found that a quick movement of the iagnet produces a greater deflection of ie needle than a slow movement.

If the needle be closely watched it will e found to swing in one direction when ie north-seeking pole of the bar magnet withdrawn, and in the other direction hen the opposite end is used. It will ving in one direction when one end of e magnet is withdrawn, and in the her when the same end is approached. will also be noticed that the current ows only while the magnet is in motion.

To summarise the facts learnt from is experiment, they are that (1) any iteration in the strength of a magnetic ld enclosed by a coil of wire produces flow of electricity in that wire; (2); the irection of the current depends upon the plarity of the magnetic field and upon le nature of the alteration, whether in- ease or decrease; (3) the current only ows during the period of alteration; (4) le strength of the current depends upon le speed of the alteration.

(To be continued.)

EINFORCED CONCRETE AND ITS PRACTICAL APPLICATION.*

Various engineers in Great Britain ve already used reinforced concrete to great an extent that it would seem unecessary to dwell upon any lengthy arument advising the use of this material buildings and other constructions.

Its efficiency has been thoroughly denstrated, and it is now recognised as permanent method of construction, oof against the deteriorations to which ner materials are subject. The fire at ltimore gave evidence of its being fireoof; the earthquake at San Francisco owed it, to a great extent, to be proof ainst earthquake; innumerable inances have convinced users that it is st-proof; and the Pantheon at Rome oves it to be practically everlasting.

A reinforced concrete structure, cast as monolith, is more rigid than steel, ere rigid connections can only be seired at great cost. The corresponding ength obtained from this cause is one the reasons for the economy secured in use, and in the hands of capable deners, girders and other structures can made as strong in reinforced concrete in structural steel. Finally, what is st advantageous about it is that its ength continually increases with age.

The Question of Cost.

An engineer, in deciding upon the use any building material, after satisfying mself as to its suitability and efficiency, quires as to its probable cost. In all portant structures, and in all buildings ere steel framing might be used, reinced concrete will prove an economical uctural material. In this country, wever, there are many places where it uld be of no advantage whatever to ve a steel or concrete frame building, far as the external walls are concerned, account of the thickness of the walls quired by the building by-laws. If ernal walls of the building are to be ilt in a structural frame, the fillingshould be made of thin panels, and ere reinforced concrete is used, these panels need not be more than 5ins. thick. If, on the other hand, brick panels are used, a 9in. thickness will suffice. As a rule, it is necessary to secure permission from the local authorities whenever it is desired to erect a construction as outlined.

*Extracts from a paper by Mr. Moritz Kahn read (Glasgow on Feb- ruary 18th, 1908, before the Institution of Engineers and Shipbuilders in Scotland (corporated).

Reinforced Concrete not always the Cheapest Method of Construction.

It is erroneous to say that reinforced concrete will always prove the cheapest method of construction. As already stated, there are instances where it is not so cheap, and engineers soon recognise such cases. Middle-sized and small residential buildings, small manufacturing buildings, and the ordinary one-storey type of building will show very little saving when reinforced concrete is used in their construction. A low retaining wall 6ft. high would be cheaper in brick than in reinforced concrete, inasmuch as it would require a comparatively thin brick wall to withstand the strain, but a retaining wall over 10ft. high could easily be constructed in reinforced concrete cheaper than in brick. Isolated girders and roof trusses high in the air will invariably prove cheaper in steel than in reinforced concrete; but a steel structure, after having been built, will always require a certain amount of upkeep, and the maintenance charges thus entailed will have considerable influence on the total cost. In brief, though the material under discussion may not always be the cheapest form of construction, it is generally the most economical when all things are taken into consideration, such as the additional safeguard against fires, with a corresponding efficiency in one's plant, the reduction in fire insurance premiums, and also the reduction in maintenance charges.

Availability of Materials.

One of the reasons for the popularity of reinforced concrete lies in the fact that the constituents from which it is made can easily be obtained in almost any locality. In every part of England there are cement mills, and it is never necessary to look far for sand and crushed stone or ballast. These materials being found near the site produce a considerable decrease in the freight charges of building materials. The only remaining constituent which need be brought any distance is the reinforcing steel, but such steel will only be about 20 per cent. of the weight of the material which would be used in an ordinary steel structure, and consequently the freight is reduced in accordance therewith.

The Use of Crushed Stone or Ballast.

In the selection of materials, the question is often asked whether preference should be given to either crushed stone or ballast. Engineers are wont to object to the use of the latter, on the ground that the surfaces are generally round and too smooth. It has often been demonstrated that round smooth ballast give just as strong a concrete as crushed stone. This statement might be limited by the fact that in the early stages, say at the end of two weeks, crushed stone concrete will be found to be a little stronger than ballast concrete, but at the end of 30 days ballast concrete is just as strong as stone concrete, and from that time on its strength begins to surpass it.

Ballast is often considered unsatisfactory as a fire-resisting material. At a fire test made recently it was found that ballast concrete would not go through the ordeal; but the ballast used in that test was uncrushed, and portions of it were of considerable size.

Large stones when heated to a certain temperature will fly apart, owing to the internal strains existing therein, but small stones heated to the same degree will not disintegrate. If the ballast used in that test had either been crushed or screened to pass a ¾in. mesh, the floor slab in question would have successfully withstood the test. A similar test was made by myself for the New York City Fire Department in 1904, using crushed ballast concrete with satisfactory results.

Sand in Concrete.

With reference to sand used in concrete, some engineers specify that it shall be sharp and coarse. It is however very probable that these specifications will soon be eliminated. It has been recently proved that a moderately fine sand will give a stronger concrete than sharp coarse sand. In the selection of this material, however, it is necessary to discover whether it contains chemicals which might act on the cement. Sand taken from beds in contact with impure water kills the action of the cement, and should be condemned. Pit or bank sand is a very satisfactory kind to use. The cement should be of the very best grade, and should be subjected to many mechanical tests during the progress of the work. There is no necessity to dwell upon this material, as the products now being turned out by the various leading English mills are of such excellent grades that very little difficulty should be experienced in securing a proper quality. In this respect English cements are probably the best in the world.

Mixing and Hoisting.

The handling and mixing of concrete is a feature which to a great extent governs its cost. Many engineers object to the use of machine mixers. The use of a good batch machine mixer is advisable, however, on every large construction. When the concrete is mixed by hand it is turned from six to eight times, but when a machine mixer is used the concrete is turned at least twenty times in a much shorter period, and at a considerable saving in expense. In truth, a good machine mixer should actually be specified, provided the size of the construction and the amount of concrete to be mixed warrants the expense of installing such a plant. In general it will be found that in all constructions involving a quantity less than 400 or 500 yards, the concrete will be more economically mixed by hand than by machine, but in larger constructions the reverse is true.

As regards hoisting concrete, probably the best arrangement is that in which a self-dumping bucket is raised up a tower and automatically tipped at the required level. The cost of such an arrangement is about £150, and the saving over other methods of hoisting is about 5d. per cubic yard.

Inspection.

One of the most important matters in connection with reinforced concrete is that concerning its inspection or supervision. An inspector who is too fastidious can do quite as much harm by over-inspection as one who does not sufficiently perform his duties. An inspector should be the intermediary between the owner and the contractor, and it should be his duty to see that everything runs smoothly, his main object being to keep the interests of the contractor in line with those of the owner, thereby securing the best results An over-anxious inspector is apt to disgust the contractor, causing him to lose interest in the construction, with the result that poor work must follow. It is

assumed, of course, that good materials and workmanship are always to be demanded.

An Example.

The following instructions for inspecting reinforced concrete construction, written for the benefit of our inspectors, may be of interest:—

"Centering and supports must be properly braced and cross-braced in two directions. False work or centering should be removed with great care, and without injuring the construction by droping heavy sections thereon. No centering should be removed in less than three weeks. A good rule governing the length of time for the centering to remain in position is two days for each foot of span, that is, a span of 12ft. should remain centered for 24 days, and a span of 16ft. should remain centered for 32 days. The supports should under no consideration be removed in less than three weeks. No centering need remain in position longer than 45 days, no matter how great the span. Temporary shores should be placed under all main girders which might be subjected to heavy loads during the course of construction. Where centering supports come on soft ground, a heavy plank or timber should be placed underneath them to prevent their being forced into the earth. Reinforcing steel should be free from oil and paint. A slight film of rust is not objectionable, but all loose scales should be cleaned off with a stiff wire brush. Where Kahn bars are used as reinforcement the diagonals should be bent up to an angle of 45 degrees with the main tension bar.

"Samples of materials used should be subjected to mechanical tests. Only clean water, free from acids and strong alkali, should be used in the mixing. The resultant should be that known as a wet mixture rather than that termed a dry mixture. No concrete which has once begun to set should be deposited thereafter in the forms. Sections which have recently been concreted should not be travelled over. Concreting should never be carried on in freezing weather. In case the concrete, after having been deposited, should become frozen, the centering should never be removed until it is absolutely certain that all the frost has disappeared."

Lack of time prevents the consideration of these instructions in more detail, but a similar set of instructions can be drawn up by any engineer in charge of this form of construction. Probably one-half of the responsibility of a reinforced concrete structure depends upon the inspector in charge, and it is important that he should be as familiar with the class of work as the foreman who is to carry it out, and, at the same time, he should bear in mind the objections to his being too theoretical in his inspection; the practical man will secure better results.

Calculations and Empirical Formulæ.

Since the Royal Institute of British Architects thought that reinforced concrete, as a structural material, was of sufficient value to devote to it the attention and research of a special committee, which committee summarised the general principles for designing reinforced concrete, and published formulæ recommended by them, there is no necessity for me to burden this paper with any mathematical problems. Nor is it necessary to attack the methods of calculations employed by the patentees of the various systems, unless such calculations are based purely upon empirical formulæ. Empirical formulæ should not now be used, for sufficient progress has been made in scientific research to establish definite results, and though various authors who do not employ empirical formulæ differ widely in their methods of calculation, it will usually be found that there is very little difference in the result, no matter what method is used.

Failures in Reinforced Concrete.

In view of the large number of structures which have been erected in reinforced concrete, it might be asked—What is the percentage of failures as compared to the number of successes? This would be a logical question, and it is proposed to deal with it accordingly. That failures do occur is more or less obvious, but one of the objects of this paper is to show (1) why they occur, and (2) the means of preventing them. As a general statement, most of the failures which have occurred have been due to carelessness or ignorance on the part of supervisors or workmen engaged on the particular construction referred to. This being so, it would appear a simple matter to provide means for obviating the same, more especially as failures due to faulty design are but rarely heard of.

The Danger of Removing Centering too soon.

An accident occurred at a building being erected for the Kodak Co., at Rochester, New York, and a brief statement of the causes governing the accident may be interesting. The building referred to was to be constructed of concrete in a limited time. The foreman in charge, being desirous of hastening the execution thereof, one rainy day instructed some outside workmen to remove the centering from under the floor, the concreting of which had been completed some 30 days previously. Instead of seeing that his instructions were carried out he allowed the men to remove the centering without paying the attention to them which the importance of the work required. The result was that centering was removed from work which had only been completed 10 days' before. The accident was solely attributable to this, and the foreman was to blame for improper attention to his duty.

The lessons to be drawn from this accident are (1) that the foreman must be capable of carrying out simple instructions implicitly; (2) that centering dare not be prematurely removed, or indeed removed at all under any circumstances, except under the personal supervision of the foreman; (3) that the removing of centering is just as important as the construction of the floors, and should be as carefully supervised.

A simple method of preventing such failures would be the attachment of a small label to the centre uprights supporting each girder form. On this label could appear a notice to the effect that the centering should not be removed until a certain date, the date, of course, being left blank, to be filled in by the foreman as required, but to be not less than 30 days after the concrete is laid. This simple precaution would add considerably to the safety of reinforced concrete structures, at no material increase in cost.

This particular accident is mentioned because it is illustrative of the majority of failures which have occurred. As previously stated, accidents due to faulty design are rare, but that they do occur is evident from the accident which occurred at the Madrid Reservoir, which had a capacity of 106,000,000 gallons. The roof of this reservoir was designed on the lines of parabolic arches of nearly 20ft. span, with a rise of 2ft., the thickness at the crown of the arches being only 2in. It was assumed that when the roof was uniformly loaded over the entire area the thrusts of the various arches would counteract each other, thus allowing the arches to carry their load. Theoretically the structure was correct, but in designing it the engineers appear to have forgotten that with an area such as this it would not be possible to place the entire load on at once. As a matter of fact, in order to place the load, it was necessary to start at one end and to work towards the other, loading some of the arches before the others, with the result that thrusts in the abutments were produced which were transmitted to the unloaded arches, thus causing them to buckle upwards, doubtless because of the thinness at the crown. No lateral stiffness could be depended upon from the columns, which were too small in diameter for their length.

In testing the structures the engineer used sand about 2ft. deep, on a strip 13ft wide over the entire width of the reservoir. This weight of sand was safely carried overnight, but the following day one of the bays collapsed, with the result that the thrust previously referred to caused the collapse of all the adjoining bays, until the whole structure fell in like a pack of cards.

The Lesson to be Learned

from this failure is that though a design may be theoretically correct, consideration should also be given to the method in which the structure is to perform its work.

An arch, when designed to carry a uniformly distributed load will do so if the load is placed upon the entire arch at the same time, but if, for one reason or another, the eccentric loading of an arch is necessitated, it should be designed to provide for contingencies of this sort.

However, the failures in reinforced concrete bear but a very small percentage to the number of successes, and even the small percentage of failures that do occur could be eliminated with the exercise of ordinary intelligence and supervision. For this reason, when an accident takes place care should be taken to avoid condemning any particular method of reinforcement before the actual circumstances are known. It is possible that the best design, and the best method of construction, when placed in the hands of careless workmen, will result in disaster. Hence the emphasis which has been laid upon the details of construction work.

The Contractor's Profit.

In brief, reinforced concrete is the best form of construction when properly handled, and the worst when improperly handled. Such being the case, it behoves the owner and the architect to ensure that only the best class of contractor is employed on his work. Reliable contractors can only afford to carry out work which will ensure them a fair amount of profit, and if, by the adoption of reinforced concrete, the owner is saved 10 per cent. of the cost of construction, it is advisable to grant the contractor any extra saving, so as to ensure his giving a construction which will prove satisfactory in every respect. When owners and engineers realise this point, and act according, reinforced concrete will then reach the position in the category of structural materials to which it is entitled.

Bankruptcies.

During the week ending Monday, June 22nd, 16 failures in the building and timber trades of England and Wales were gazetted.

A. Dunn, builder, Gloucester. R.O., June 16.

G. G. Ash, builder, Alvaston. R.O., and Adj., June 19.

J. A. E. Burrows, builder and contractor, Droitwich. R.O. and Adj., June 18.

C. H. Burfitt, builder, Bourton. First meeting, O.R.'s, Salisbury, July 9, at 2.

D. W. Burrage, builder, Carshalton, late of Wallington and Surrey. Adj., June 2. (Amended notice.)

W. Eickhoff (late trading as E. M. Eickhoff), surveyor, Bethnal Green, and Hackney Road. Adj., June 17.

A. E. Pill, painter and decorator, Earlestown. R.O. and Adj., June 20.

W. J. T. Quiller, builder, Lostwithiel. First meeting, O.R.'s, Truro, July 3, at 12. P.E., Town Hall, Truro, July 11, at 11.45.

J. Morris, builder, Richmond. R.O., June 18. First meeting, 132, York Road, S.E., July 1, at 11.30. P.E., C.C., Wandsworth, July 2, at 12.

Spiers and Son, builders, St. John's Wood. R.O., June 18. First meeting, Bankruptcy Court, July 1, at 1. P.E., Bankruptcy Court, July 21, at 11.

E. J. S. Stokes, builder, Poole. First meeting, Curtis and Sons, 42, Station Road, Poole, June 27, at 12. P.E., Town Hall, Poole, July 10, at 11.30.

W. J. Payne, builder, Fobbing, Essex. First meeting, Shire Hall, Chelmsford, July 1, at 2.30. P.E., same at 10. Adj., June 19.

W. Stubbs, builder, Bayswater, and Southend-on-Sea. R.O., June 18. First meeting, Bankruptcy Court, July 1, at 12. P.E., Bankruptcy Court, July 21, at 11.

T. Cowen, (trading as T. Cowen and Co.), painter, decorator, and paperhanger, Workington. First meeting, C.C., Cockermouth, June 29, at 12.15. P.E., C.C., Cockermouth, July 6, at 2.45.

E. C. Doughty, carpenter and builder, Oulton Broad. R.O., June 19. First meeting, O.R.'s, Norwich, July 4, at 12. P.E., Town Hall Great Yarmouth, July 14, at 11. Adj., June 19.

F. Grover (trading as W. Johnson and Co.), timber merchant, Holloway, and Kentish Town Road. R.O., June 16. First meeting, Bankruptcy Court, July 1, at 12. P.E., Bankruptcy Court, July 22, at 11. Adj., June 16.

A meeting of the creditors of James Bromage, trading as Bromage and Evans, builders and contractors, Worcester, was held at the Star Hotel, Worcester, on June 22. Creditors were present representing about £11,000, including Lloyd's Bank, £6,749. The statement of affairs showed liabilities, £8,684 18s. 3d.; and it was estimated that there would be a surplus, subject to the cost of winding up, of £2,205 10s. 1d. The meeting decided that, to enable the estate to get the benefit of the work already done on contracts that are still in hand, the business must be carried on until the contracts are completed.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 1—16. STICKFORD (Lincs.)—Erection of an elementary school and a master's house at Stickford, Lincs. Bills of quantities and form of tender with Messrs. Scorer and Gamble, architects, Bank Street Chambers, Lincoln, on or before July 1, on payment of two guineas. Tenders to be delivered before 10 a.m. on July 16 to S. Maudson Grant, secretary, 286, High Street, Lincoln.

July 2. RAWTENSTALL.—Erection of new Council school at Alder Grange, for the Corporation of Rawtenstall. Paatirculars from A. Brooklehurst, architect, St. James's Chambers, Waterfoot, on payment of £1, which will be returned after the receipt of a bona fide tender. Tenders, endorsed Rawtenstall. Particulars from A. Brooklehurst, architect, later than noon on July 2, to J. Whalley, town clerk, Municipal Offices, Rawtenstall.

July 3. LEALHOLM (Yorks.).—Alterations and improvements to Lealholm Council School, for the North Riding of Yorkshire County Council Education Committee. Particulars at the school during ordinary school hours. Tenders to be deivered not later than noon, July 3, endorsed "Tender, Alterations Lealholm School," to J. C. Wrigley, secretary, County Hall, Northallerton.

July 3. BELFAST.—Erection of a warehouse in Chichester Street, Belfast, in accordance with plans, specification, and conditions of contract, which may be seen at the office of W. J. Gilliland, F.R.I.B.A., 9, Howard Street, Belfast, with whom tenders are to be lodged not later than July 3. Quantities can be obtained from W. H. Stephens and Sons, Donegall Square North, Belfast.

July 3. ATHERTON.—Completion of tower of Hindford Church. Particulars at the church, and at the office of the architects. Bills of quantities with Messrs. Wright and Son, surveyors, Lancaster. Tenders to be delivered not later than noon, July 3, to Austin and Paley, architects, Lancaster.

July 3. WAKEFIELD.—Renovations and repairs (builder, painter), to the Registry of Deeds Offices, Wakefield. Plans with the architect, as below. Tenders to be forwarded not later than 10.30 a.m. July 3, to J. Vickers-Edwards, County Architect, County Hall, Wakefield.

July 3. LOW BENTHAM.—Erection of a school at Low Bentham, near Settle, for West Riding Education Committee. Plans with T. Benson P. Ford, Esq., J.P., County Councillor of the District. Specifications and bills of quantities with the County Architect. A deposit of £1 is required. Cheques, etc., must be made payable to the West Riding treasurer, and sent to him direct at the County Hall, Wakefield, otherwise applications will not be entertained. Tenders to be forwarded not later than 10.30 on July 3, to J. Vickers-Edwards, County Architect, County Hall, Wakefield.

BUILDER'S Clerk (24), seeks situation; 7 years' London experience. P.C. jobbing wages; schedule work and assist estimates; good refs.—B., 11, Belitha Villas, Barnsbury, N. 4404

BUILDER'S Assistant (24), 8 years in and outdoor experience with large London contractor; quantities, general office routine; assist estimating and supervision.—Box 4401, BUILDERS' JOURNAL Office.

CARPENTER-JOINER (31), seeks situation; good all-round man, good draughtsman, etc. Three years present job, now finishing. Town, country, and teaching experience. Excellent references.—G. K., 8, Tudor Road, Upton Park. 4313

CLERK of Works, contractors' manager, or general foreman disengaged, carpenter and joiner, practical in all details; smart, energetic, trustworthy, recently concluded large industrial undertakings; accustomed to large jobs. — Box 4341, BUILDERS' JOURNAL Office.

ENTERPRISING qualified builder wants situation as foreman or clerk of works; thorough knowledge all trades and management; highest testimonials. —Box 4258, BUILDERS' JOURNAL Office.

EXPERT all-round Engineering draughtsman (over 10 years' experience) wishes for occasional work at his own home, or otherwise; lowest terms.—Freeman, 44, Horsell Road, Highbury, N. 4416

FOREMAN Painter, could take entire management of flats or estate. Good estimator. Well up in all trades connected with buildings. Age 35. Life abstainer.—B. Calverley, 20, Fernlea Road, Balham. 4325

FOREMAN painter, or leading hand, painter, grainer, paper-hanger, etc.; good general experience, abstainer; good references; permanency wanted.—H. North, Standon, near Ware, Herts. 4377

GENERAL Foreman, clerk of works, foreman mason, or estate manager, 9 years last situation; experienced in all trades; abstainer.—Allen, 35, Princes Street, Peterboro'. 4334

GENERAL Assistant (30), fourteen years' excellent all round experience, good knowledge of construction, sanitary science, and everything in building estate development; Surveyors' Institution and Municipal and County exams. £4 4s. and prospects of betterment.—Apply Box 4318, BUILDERS' JOURNAL Office.

GOOD shopfitter and case-maker requires constant job; abstainer; refs. if required. Indoor hand. — Box 4388, BUILDERS' JOURNAL Office.

GENERAL Foreman wants job; town or country; carpenter; age 44; experienced new or alterations; good timekeeper and manager of men; highest references; moderate terms. — King, 4, Burgos Grove, Greenwich. 4225

IMPROVER or junior assistant (22), student R.I.B.A., excellent knowledge, practical building construction experience, supervising, neat draughtsman, surveying; assist quantities; small salary, specimens; good references.—Box 4090, BUILDERS' JOURNAL Office.

IMPROVER or junior assistant (21) desires position with architect or surveyor; working drawings, quantities, surveys, qualified P.A.S.I.; nominal salary.—R. R. F., 25, Queen Street, Hemel Hempstead. 4321

JUNIOR Draughtsman (19), desires re-engagement; assist generally; good refs.; town and country; shorthand; probationer; R.I.B.A. — C. Weston, The Laurels, Rotherfield, Tunbridge Wells. 4376

JUNIOR Assistant (20) requires situation in surveyor's or builder's office, 3 years' experience with London surveyor; can assist in abstracting, working up, variations, etc.; willing worker.—W. Cooke, 102, Faraday Road, Wimbledon, S.W. 4333

JUNIOR Assistant (19), desires engagement with architect, just completed 4 years' articles; probationer R.I.B.A., good draughtsman; tracer, colourist, etc.; assist quantities; salary required. —Jeffery, Hardinge Road, Ashford, Kent. 4268

PLUMBER (good registered.) Thoroughly practical in all branches of first-class sanitary work, lead-laying, gas and hot water fitting; new, alterations, or jobbing. Reference.—Plumber, 20, Sunnyside Road, Upper Teddington. 4364

PLUMBER, gas and hot water fitter, desires employment; good refs.; total abstainer; wages moderate.—P. A. J., "The Lodge," Bonner Hill Road, Kingston. 4390

PRACTICAL machinist (joiner), used to elephant, spindle, and first-class work; 10 years last place.—Cruse, Boxford, Newbury. 4405

QUANTITY Surveyor's assistant, just completing three years' articles, passed Intermediate of Surveyors' Institution; first class references, seeks billet in busy office; salary £7 per mensem.—Box 4346, BUILDERS' JOURNAL Office.

SURVEYOR'S Junior Assistant (19), Student S.I., served articles; good leveller, draughtsman and tracer; experienced in private street works, building, sewerage, water supply, etc.; excellent testimonials; small salary. — Box, 4284, BUILDERS' JOURNAL Office.

SURVEYOR, architect's junior assistant (24), familiar estate work, surveying, levelling, general building work; small specifications, and quantities; 4 exams. Inter. R.I.B.A., June next, 1½ guineas.—Box 4288, BUILDERS' JOURNAL Office.

THOROUGHLY competent builder's book-keeper and general assistant requires engagement, 12 years' experience in London with builders and shopfitters; good reasons for leaving present berth; excellent references. Age 32.—Apply Box 4334, JOURNAL BUILDERS' Office.

TEMPORARY assistance on working drawings, quantities, measuring up, surveys, levels, setting out and steelwork generally rendered at own or outside offices—F. B., 51, Hillfield Park, Muswell Hill. 434

THE ESTATES MANAGER AND AGENT to well known public institutions. London estates (comprising over 1,000 properties), holding appointment, over 11 years, desires similar appointment in town or provinces, with view to improving his position; exclusive knowledge and experience in management of leasehold and troublesome weekly properties; thoroughly qualified architect and surveyor; administrative ability and experience in rent collecting; highest references. — Apply Box 4331, BUILDERS' JOURNAL Office.

TO ARCHITECTS.—An experienced Civil Engineer will advise upon and assist on drainage disposal, water supply and estate development; roads, surveys, levels, etc.—Apply Box 4121, BUILDERS' JOURNAL Office.

TO Contractors and Builders.—Smart, energetic and experienced general foreman desires re-engagement (carpenter and joiner by trade). First-class refs.; moderate salary for good job.—Please write "London," Box 4392, BUILDERS' JOURNAL Office.

WANTED at once, position as builder's manager, assistant, or general foreman; disengaged; small, energetic; abstainer; references. — Box 452, Broadway, Wimbledon. 43

YOUNG architect, having completed engagement with well-known city surveyor, is at liberty to assist architects with the preparation of their designs; 7 years experience. Student R.A. School and R.I.B.A.—Box 4294, BUILDERS' JOURNAL Office.

July 8, 1908. Volume 28. No. 700.

Revised Design for London County Hall.

A revised design for the river front and Westminster Bridge elevation of the London County Hall has been prepared by the selected architect, Mr. Ralph Knott, and a perspective of it has been drawn for the inspection of members of the Council. We have not yet had the opportunity of seeing this perspective, but from a report by the Establishment Committee we learn that the elevation follows, generally, the main lines of the design selected by the assessors, and that the modifications suggested by the assessors in their report have been introduced. The central projecting features have been reduced and the large flight of steps leading from the embankment to the river in front of the central bay of the design has been omitted, while substituted therefor are the slightly projecting pedimental bay and flights of steps parallel to the embankment. An important feature has been introduced by the addition of an attic storey in the centre of the river front. "The selected architect is strongly of opinion that the introduction of this elevated block will very much enhance the appearance of the building on the river frontage. Another advantage is that additional room for the accommodation of staff can be provided at a moderate cost."

German Joinery.

The Derbyshire Education Committee has issued a statement in reference to the controversy regarding the purchase of German joinery for the new temporary schools which are being built at Long Eaton. The matter, it will remembered, was the subject of a question in Parliament the other day. Mr. Runciman's reply was as follows: — "I have no information as to where the joinery work for this school has been purchased. The function of the Board of Education in this connection is limited to securing that the buildings and equipment of public elementary schools are satisfactory from an educational point of view, and not unreasonably extravagant; and they have no power to direct from what sources the local education authority should make their purchases. I understand that the building in question is a 'Doecker' building which the Board regard as suitable for temporary purposes." From the committee's statement it seems clear that more has been made of the incident than is warranted by the facts of the case. Pending the erection of the new permanent school, the committee purchased a movable "Doecker" school from Hasserodt and Co., at a cost of £980, and in answer to the claim that Long Eaton contractors should have been allowed to tender for the building they say that whilst it happens that the building is required in the first instance at Long Eaton, it has been obtained for general county use, and it is not likely that Long Eaton will have to provide more than, say, one-tenth of its cost.

Protection and the Building Trade.

While referring to this matter, we may opportunely quote from an article by Mr. L. G. Chiozza Money, M.P. (whose "free trade" predilections of course colour his view) which appeared in the "Bristol Mercury" for Thursday last:—Mr. John Burns said recently:—"It is a curious fact that, although the building trade is not subject to foreign competition, it is always the most fluctuating, and has always the largest number of men out of work." Upon this the editor of the "Timber Trades Journal" commented as follows in the "Standard": "Such a statement could not have emanated from anyone in touch with the journeymen carpenters, manufacturing joiners, and saw-mill proprietors of this country, who find their trades year by year dwindling away owing to the annual importation of hundreds of thousands of ready-made doors, principally from Sweden and the United States, to say nothing of the shiploads of window-frames, mouldings, sawn laths, door-steps and other articles used in the building trade, which could be manufactured in this country at a slight increase on the cost of the imported article, and by that means find employment for some thousands of our idle workmen. Among other building materials subject to keen foreign competition may also be mentioned slates, which are sucessfully imported from America and the Continent in competition with the products of the Welsh quarries. The list might be added to by the inclusion of such materials as iron girders, glass, granite, etc." In reply, Mr. Chiozza Money says:—"Curiously, our Protectionist critic does not deal with the building trade as such, but with the trades which supply its materials. He speaks of mouldings, slates, iron, glass, granite, etc., and talks of foreign competition in the trades which supply them. He forgets, however, that the building of a house is done 'in situ,' and that houses are not, and cannot be, imported. Nothing can alter the fact that by far the greater part of the work of a house must be done in this country. . . . The case of the bricklayer is typical of the majority of British occupations. He cannot be provided with an import duty. Bricklaying cannot be done from abroad. The mason's work does not meet with foreign competition. The bricklayer has everything to lose and nothing to gain by Protection. For what does the 'Timber Trades Journal' hint at? Duties on joinery, iron, glass, granite, 'etce era,' the latter in this connection an ominous word, covering scores of different building materials. But if all these building materials are to be taxed, what is to become of the builder? You have only to raise the cost of building materials to depress the building trade. Fewer houses would be built, and consequently there would be less bricklaying. And the carpenter would suffer with the bricklayer, and with him also the tiler, slater, plumber, painter, and all other men in the building trades. The carpenter would not find more doors or mouldings to make, because there would be less building than in the days when doors and mouldings could be imported freely. It would be all very well for the carpenter if he could have doors or mouldings taxed while all other materials went free, but that would not happen. The taxation of ready-made doors would imply the taxation also of iron and glass, and even granite. So that the worst thing in the world for the carpenter would be the taxation of doors. It would hit him as badly as it hit the bricklayer or plumber. . . . And now as to the statement that trade in dwindling through the increased importation of joinery. Here are the facts:—

Importation of (1) Timber; (2) Furniture Woods and (3) Joinery.

	1887.	1907.
Timber (loads).	5,654,000	9,498,000
Furniture woods (tons)...	96,000	304,000
Joinery.....	£488,000	£223,000

These figures show beyond cavil that employment has not be destroyed by imports, but that, on the contrary, the amount of work done on wood has enormously increased. A most pleasing thing, also, is the very large growth of imports of furniture wood, pointing to the existence of more comfortable homes, as well as more employment. . . ."

THE FRANZ JOSEFS-KAI, VIENNA.

A Contract Matter.

The Tyne and Blyth District Conciliation Board for the Building Trades has circularised a letter in regard to the question of employers undertaking contracts to find the labour only, the material being found by the client or the owner, or ordered by the architect. The subject has cropped up frequently with the men, and with a view to avoiding further friction the following resolution was passed at a recent joint meeting of employers and operatives:—

"That representations be made to owners and architects, and others interested, that contracts based on goods being supplied by the owners and the labour only by the contractor are dertimental to the building trade."

It is pointed out that numerous contracts submitted to employers for consideration, owing to their containing so many prime-cost sums and other items, leave to the builder little more than the provision of the labour, which has caused much misunderstanding with the operatives, who complain that the working rules are being violated by the employers. The above Board draw attention to the terms of the resolution passed, and ask all concerned to support the spirit in which it is framed.

The Society of Engineers: Some New Proposals.

Several matters of general interest are announced in a circular which has been sent out to members of the Society of Engineers. First and foremost there is the proposal to amalgamate with the Civil and Mechanical Engineers' Society, a scheme which has been brought about by the intervention of Mr. A. S. E. Ackermann, A.M.I.C.E., as secretary of both societies. The terms of the amalgamation will shortly be expressed by a draft of new rules which will be submitted to members, and it is confidently believed that the amalgamated society will secure a large accession of new members. Another scheme aims at giving gratuitous advice both of a general and legal character to members in connection with their professional work, or their relationship with their clients or employers. For the former, a standing committee of the council has been appointed, while, for the latter, arrangements have been made with the Society's solicitors for a term covering up to December 31st, 1909. Members are invited to forward to the secretary full statements of any circumstances which may involve questions upon which general or legal advice may be of service. This arrangement is tentative, and it will be decided to continue or modify the arrangement according to the result of the first year's working. It is not at present possible to undertake legal action on behalf of individual members, nor to supply "counsel's opinion" free of charge, but obviously such an extension of the work is only a matter of finance, and directly depends upon the support accorded by the profession at large. Other points under consideration, in addition to the card-index "Employment Register" and "Business Directory" of members, recently inaugurated, affect larger questions involving the interests of the profession as a whole. While the council could not take any active steps in this direction without the co-operation of other kindred institutions, it seems very desirable that some attempt should be made to bring such matters forward for the purpose of discussion, and the council are considering the best means of carrying this into effect.

SOME IMPRESSIONS OF VIENNA.—III.

By Alfred W. S. Cross and E. A. Rickards.

(Concluded from page 3, No. 699.)

The most important of the many civic improvement schemes carried out in Vienna during the last decade of the 19th century was the construction of the suburban railway, with which was combined a very practical arrangement for the much-needed regulation of the River Wien. Previous to the formation of the railway, this river, at ordinary times little more than an evil-smelling brook slowly meandering along one of the sides of an

THE FRANZENS-RING.

KEY-PLAN OF THE RING-STRASSE, VIENNA.

THE SCHOTTEN-RING.

immense bed, was liable, on occasions, to be converted into a formidable and destructive torrent, but under the combined scheme which has now been realised, half of the bed of the river has been walled off for the purposes of the new railway, and the other half made sufficiently deep to receive the maximum flow of water. From time to time the main arteries of traffic, within the inner city, have been as far as possible widened and otherwise improved, with the result that, in recent years, the ancient part of Vienna has become more commodious, and far healthier.

The immense cost of the transformation of the area previously occupied by the fortifications into the stately boulevard or "ring" which now encircles the Innere Stadt, did not fall very heavily upon the population, as by far the greater part of this burden was borne by the fund realised by the sale to capitalists and speculators of the surplus land not required for public buildings and open spaces. The cost of the subsequent inclusion of the former suburbs into the city proper has also, to a large extent, covered its own expense through the acquisition, by the town, of the improved area thus obtainable. The activity displayed in the construction of the new streets was followed by the erection of the palatial tenement and business houses characteristic of the Vienna of to-day, in some of which the architects of the "secessionist" school have indulged in a liberal display of external mural decoration in relief.

To obtain a good idea of the planning of the city, a peregrination should be made, from end to end, of the Ring-Strasse (for which purpose there is no better starting point than the northern part of the Franz-Josef-Kai), proceeding thence through

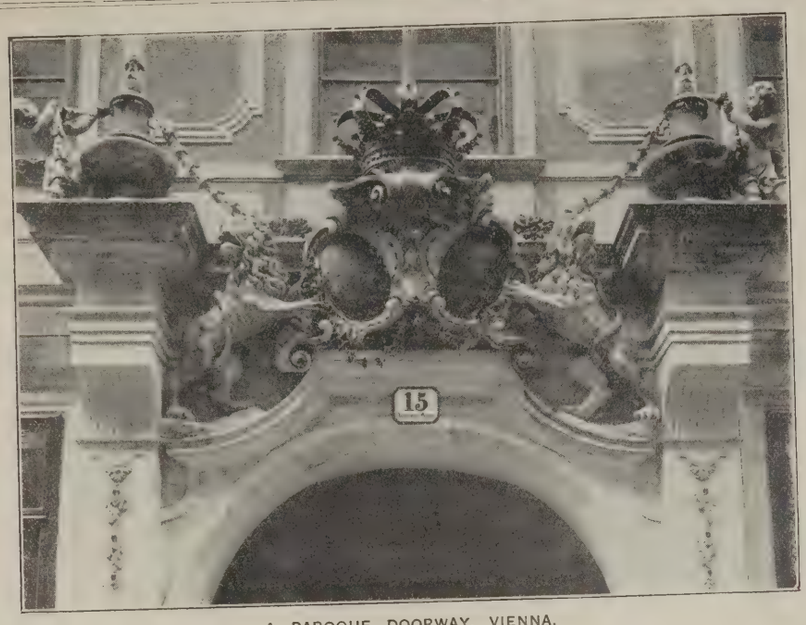
the Schotten-Ring,

which extends from the river embankment to the Maximilians-Platz, fronting the Votive Church.

Commencing, then, at the Franz-Josef-Kai, the first public building of importance is the Exchange, built, in 1872-77, in the Renaissance style, after the designs of Hansen and Tietz, and containing a finely designed central hall.

A little beyond the Exchange, on the right at the corner of the Hessgasse, is

THE OPERN-RING.



THE SCHWARZENBERGPLATZ.

the Stiftungshaus or Suhnhaus, a charitable institution designed by F. Schmidt, and built in 1885, at the cost of the Emperor, on the site of the Ring Theatre, which had been burned down a few years previously.

The Votive Church, designed in the Gothic style, by Baron von Ferstel, between the years 1856-79 to commemorate the Emperor's escape from assassination in 1853, has a richly decorated façade flanked by slender twin towers, 325 ft. high. It stands immediately behind the triangular-shaped open space formed at the crossing of the Schotten-Ring with the Alserstrasse and Wahringerstrasse, and known as the Maximilians-Platz, where there is always a large amount of street traffic.

The Franzens-Ring.

South of the Schotten-Ring is the Franzens-Ring, containing as its central feature the attractive and well-wooded Rathaus Park, in which are the Strauss-Lanner monument and eight marble statues of benefactors of Vienna, removed from the former Elisabeth-Brücke. Flanking the Rathaus-Park on the right, stands

A BAROQUE DOORWAY, VIENNA.

the University, a huge Renaissance structure, built after the designs of Ferstel, in 1873-84. On the left is the Reichsrats-Gebäude, designed in the Greek style, and set behind the Rathaus Park to form the central feature of the grouping rises the stately outline of Schmidt's Gothic Town Hall. Opposite the Rathaus, on the east side of the Ring Strasse, is the Hofburg Theatre.

The skill displayed in the architectural arrangement and setting-out of these buildings is admirable, but as they were all erected within a few years of one another it is possible that an even better æsthetic result would have been obtained had they all been designed in one and the same style of art.

The Volksgarten, opposite the façade of the Reichsrats-Gebäude, adjoins the Hofburg Theatre on the east side of the Franzens-Ring. Beyond the Reichsrats-Gebäude, to the left, is the Justizpalast, built in 1875-81—an example, by Alex Wielemans, of the German Wielemanster-Renaissance. To the south is the Deutsche Volkstheater, designed by Fellner and Helmer, in front of which is a monument to Ferd. Raimund, the Vienna dramatist.

The Burg-Ring.

The Burg-Ring is bounded on each side by fine pleasure grounds, those on the south-west being known as the Maria-Theresien-Platz. Here stands the grandiose monument to Maria Theresa, erected in 1888, after the designs of Hasenauer, and consisting of a colossal bronze figure of the Empress, enthroned on a marble pedestal 43 ft. in height. The panels of the pedestal are enriched with portrait groups of distinguished men of the period of the great Empress, and below the central feature there are equestrian figures and statues. The Maria-Theresien-Platz is further adorned by four fountains with marble figures by Schmidgruber, E. von Hofmann, and H. Hardtl, and by two colossal groups of Horse Tamers (by Friedl). The two Imperial Museums flank this Platz. On the opposite side of the Burg-Ring is the Outer-Burg-Platz (with its equestrian statues of Prince Eugene and the Archduke Charles), on the left of which is Semper's wing of the Hofburg.

On the south-west stands the Outer-Burgtor, erected by Nobile in 1821-24, on which is inscribed the motto of the Emperor Francis II.: "Justitia regnorum fundamentum."

The Hofgarten, or Kaisergarten, on the south-east side of the new wing of the palace contains an equestrian statue of Francis I. (1745-65), the husband of Maria Theresa.

The Opern-Ring.

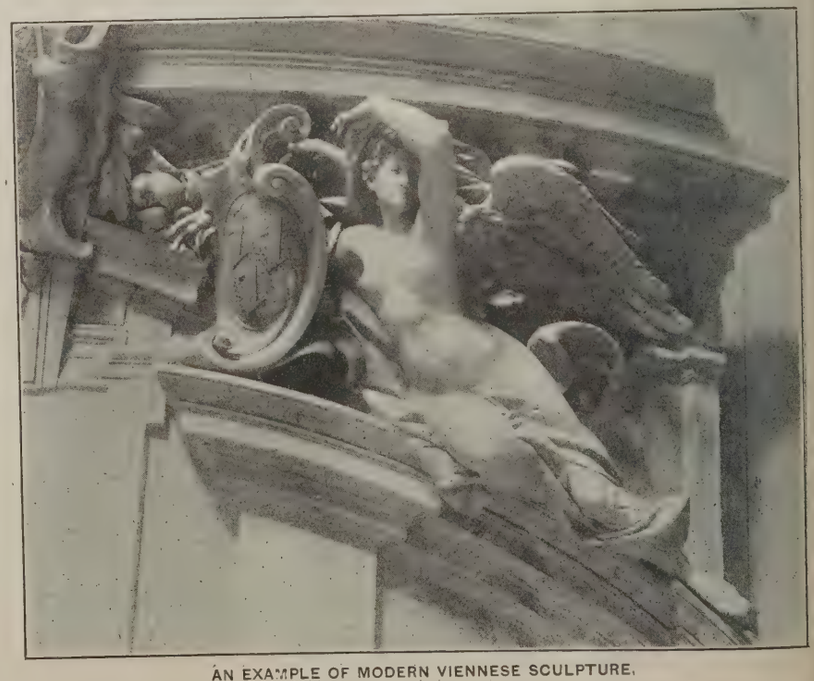
The Burg-Ring is continued to the east by the Opern-Ring. To the left at the beginning of the Albrechtsgasse, which leads to the Albrechts-Platz, is a bronze statue of Goethe by Edm. Helmer and opposite, to the south of the Opern-Ring, is the Schiller-Platz, in which stands a bronze statue of Schiller, placed on a pedestal surrounded by allegorical figures. On the west side of this square is the Ministry of Justice, on the east side the Ministry of Railways, and on the south side the Imperial Academy of Art (a Renaissance building designed by Hansen and erected in 1872-76), the upper storeys of which are enriched with copies of statues after the antique.

The Imperial Opera House (left) and the Heinrichshof (right), designed by Hansen in 1861-63, and adorned with frescoes by Rahl, are at the end of the Opern-Ring.

The Kartner-Ring.

The Kartner-Ring, the fashionable residential quarter of the city, contains a number of fine houses and hotels, and from the Schwarzenberg-Platz, which is placed between it and the Kolowrat-Ring, rises the equestrian statue of Prince Charles Schwarzenberg, the victorious leader of the Allies in the wars of 1813-14. On the left is the Palace of Archduke Ludwig Victor, and on the right Baron Wertheim's palace, both designed by Ferstel. Further south, beyond the Wein, is the Palace of Prince Schwarzenberg, in front of which stands the Hochstrahl-Brunnen, with a jet of water 100 ft. high.

The Kolowrat-Ring.



The Kolowrat-Ring commences at the Schwarzenberg-Platz. To the right, in the Christinengasse, is the Academic Gymnasium, with a Gothic facade by Schmidt, and the Beethoven-Platz, embellished with Zumbusch's monument to Beethoven, which consists of a bronze figure of the great composer seated on a lofty granite pedestal.

The Park-Ring.

In the Park-Ring, of which the whole of one side is open to the Stadt-Park, are the Dumba Palace and the Horticultural Society's building, containing large saloons for exhibitions and concerts. Beyond is the building known as the Palace of the Teutonic Order, erected by Hansen in the Renaissance style in 1865-67, and occupied by the Archduke Eugène.

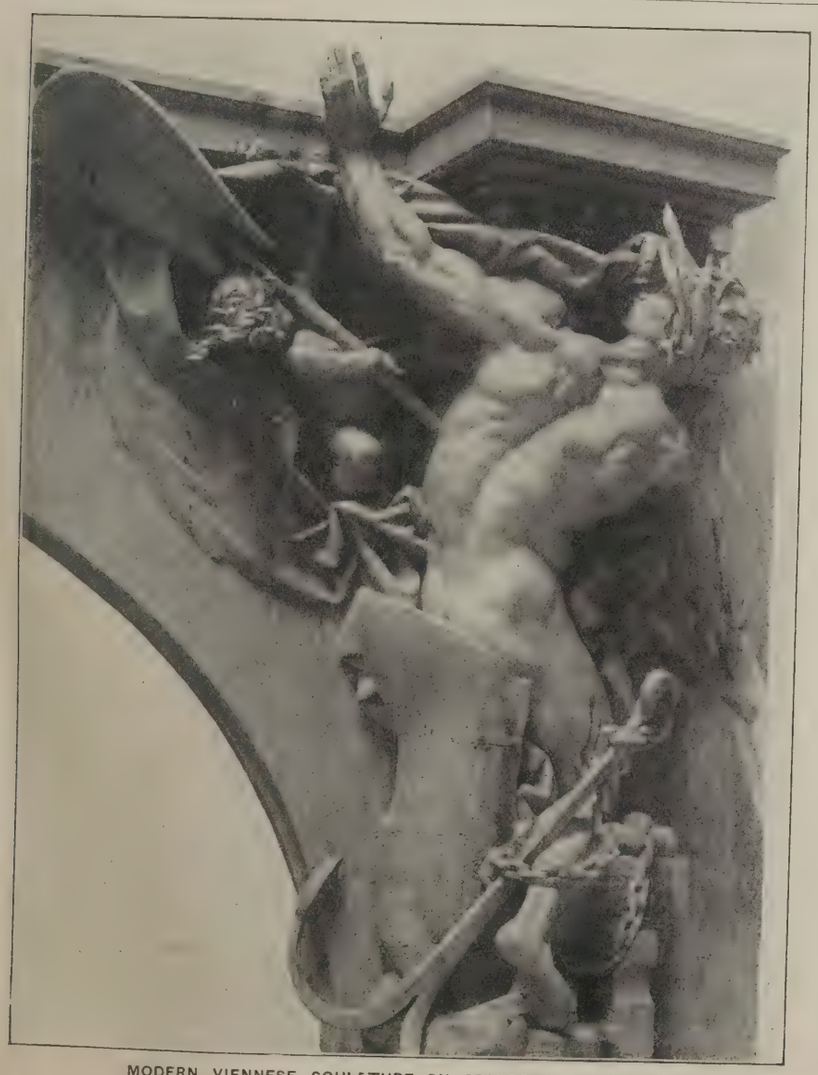
The Stuben-Ring.

In the adjoining Stuben-Ring, on the right, is the Austrian Museum of Art and Industry—another Renaissance building, adorned with sgraffito-friezes and medallion portraits of celebrated artists and art-workers. The building on the north side of this museum contains the school of arts

AN EXAMPLE OF MODERN VIENNESE SCULPTURE.

and crafts. The central passage which connects the two buildings is embellished with a large mosaic figure by Lord Laufberger.

On the left side of the Stuben-Ring a new residential quarter has been built, on the site of the barracks and parade ground which formerly stood there.



The Ring-Strasse ends at the Aspern-Brücke, a chain bridge erected over the Danube canal in 1864. Hence the Franz-Josefs-Kai leads, on the left, along the canal, passing the Ferdinands-Brücke and the Stephanie-Brücke to the starting point of the encircling boulevards at the Schotten-Ring.

The Streets of the Inner City.

Of the streets within the inner city the Graben, filled with attractive shops, is one of the principal business thoroughfares. It marks the position of the old fortifications of the 12th-century town, the houses on its north side occupying the site of the ancient wall. The Trinity Column, an extraordinary looking monument consisting of a confused group of figures among clouds (erected by the Emperor Leopold I. in 1693, in memory of the cessation of the plague in 1679), is placed in the centre of the Graben. The Kohlmarkt, another busy street, connects the Graben with the Michaeler-Platz, to the left of which stands the Church of St. Michael, dating from 1327, but practically rebuilt in the 18th century. The Mozart Monument (by Tilgner) is in the Albrechts-Platz and near it, at the corner of the Augustiner-Bastei, is the Albrechts-Brunnen, erected in 1869 and adorned with marble statues (by Meixner) of the Danube and its tributaries, above which rises the bronze equestrian statue of the Archduke Albreche. The Palace of the Archduke Friedrich, built in 1804, but altered in 1867, contains the famous "Albertina" library and collection of drawings and engravings, one of the most valuable in Europe, and familiar to all connoisseurs.

THE SCHWARZENBERG PALACE, VIENNA.

MODERN VIENNESE SCULPTURE ON SPANDREL OF ARCH.

Among the drawings are about 50 by Raphael, including some presented by Raphael to Durer in 1515, and authenticated examples of the works of Durer, Rembrandt, and Rubens.

North of the Albrecht-Platz is the Newmarket, in the centre of which is the celebrated fountain (by Ralph Donner) representing the chief rivers of the Archduchy which discharge into the Danube. On the west side of this Platz is the Capuchin Church (1622-32), containing the imperial vault, in which are the richly-decorated sarcophagi of the Hapsburg family.

Another important thoroughfare is the widened and embellished Kartner-Strasse, containing many fashionable shops. The Kartnerhof on the right, and the Todesco Palace on the left, are among the finest of the private houses to be seen in the street. Centrally placed, on the left of the street, is the Maltese Church, chiefly attended by Hungarians, and in the adjacent Annagasse are the Annahof, with a frescoed facade, and the former Jesuit Church of St. Anna, now used by a French congregation, which contains some frescoes and a picture of the Virgin by D. Gran. North of this church is the office of the Minister of Finance, designed by Hildebrand and Fischer von Erlach in 1703 and originally the town residence of Prince Eugene of Savoy. Beyond, in the Rauhensteingasse, the Mozarthof occupies the site of the house in which Mozart died in 1791. The Franziskaner-Platz, approached from the Singer-Strasse, contains a colossal statue of Moses, by J. M. Fischer. The Banco House, on the right side of the Singer-Strasse, built in 1740, is now the office of the National Debt. On the left is the fine baroque facade of the Palace of Count Breuner (1725). The House of the Teutonic Order (on the right) was rebuilt in 1730 and the Gothic Church of St. Elizabeth, dating from 1316, was rebuilt in 1730, and restored in 1864. The Greek Church in the Fleischmarkt, erected in 1787, has a new Byzantine facade, designed by Han-

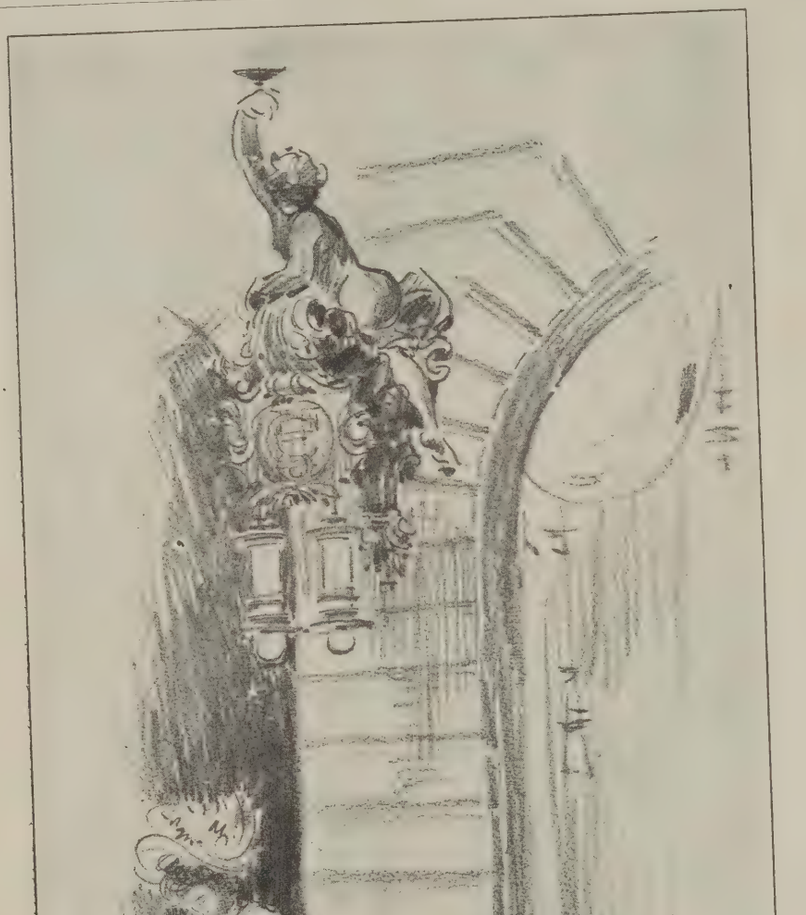
sen in 1858. The small Stadt Lugeck is embellished with the Gutenberg monument, consisting of a granite stepped platform, upon which stands a beautiful pedestal supporting a bronze statue of Gutenberg, by H. Bitterlich. The Hohe Markt (said to have been the forum of the Roman Vindobona) contains the Sina Palace (restored by Hansen in 1860), which is supposed to occupy the site of the Praetorium and the Votive Monument (by Fischer von Erlach) representing the marriage of the Virgin, and erected in 1732 to commemorate the bravery of the Emperor Joseph I. at the siege of Landau.

In the Freiung-Platz is Count Harrach's palace, a modern building, with a fine winter garden, and the Harrach Picture Gallery, containing numerous examples of the later Italian and French Schools of the 17th and 18th centuries. To the right of this palace, at the end of the Herrengasse, is the well-known palace of Prince Kinsky, designed by Hildebrand in 1713.

The Schottenkirche, consecrated in 1200, rebuilt in 1662, and recently restored, contains the tomb of Count Starhemberg, the brave defender of the city in the Turkish siege of 1683.

The Bank-Gebäude, a Renaissance building of 1860, was designed by Festel. It contains Fernkorn's fountain in bronze, known as the Nymph of the Danube, and in the court of the Anglo-Austrian Bank (formerly the Montenuovo Palace) is a fountain group of St. George and the Dragon, by the same artist.

In the Herrengasse, which is terminated by the Michaeler-Platz, is the Niederösterreichische Landhaus, or Hall of the Diet of Lower Austria, erected about 1518, enlarged in 1571, and partly rebuilt in 1839. The ground floor of the back building contains an old Gothic chapel, and on the first floor there are several rooms dating from 1571, but since modernised, including the Knights' Hall, the Assembly Hall, and the Prelates' Chamber.



The 14th-century Minorite Church contains a copy in mosaic, 30 ft. long and 15ft. high, of Leonardo da Vinci's "Last Supper," executed by Raffaeli, between the years 1806-14, by order of Napoleon.

The Archives' office is on the south side, and the Starhemberg Palace (now used for the Ministry of Public Worship and Education) and the early 18th-century palace of Prince Liechtenstein are on the north-west side of the Minoriten-Platz.

The Hotel Hapsburg is a fine example of modern street architecture, its long unbroken facade presenting the appearance of an Italian palace. The fenestration of the ground-floor rooms is arranged in a series of large rusticated semi-circular headed openings, over which is a well-designed continuous balcony supported by consoles. The upper floors have Italian Renaissance windows, and the structure is crowned by a well-designed cornice and entablature. The coupled arc lamps, placed between the ground-floor windows, are carried by large, beautifully-modelled and posed gilded figures, and the attention which has been bestowed upon the design of the internal electric-light fittings is especially noteworthy.

In the Stadt Lugeck is a modern shop-front, that of the Teppichaus Orendi, which possesses many features of interest. The composition comprises a huge archway filled in with plate glass set in a well-designed framework of bronze, in front of which is a low central doorway. The amount of window space thus obtained for the display of fabrics, such as carpets and rugs, is probably almost unique.

Owing, doubtless, to the peculiarities of its situation, the population of Vienna is of a cosmopolitan and heterogeneous character, for although the German element is largely in the ascendant, there are also many Czechs, Hungarians, and Slavs. But whether they be of Germanic or Slavonic extraction, there is no doubt that the citizens are thoroughly united in love and appreciation of the splendours of their ancient capital, nor indeed could the temperament of the genial pleasure-loving Viennese find a more suitable environment than in that stately and historical city, rich in numerous old-time memorials, whose beautiful thoroughfares and streets bright with trees, flowers, and works of art, we have thus, all too inadequately endeavoured to describe.

THE HOTEL HAFSBURG, VIENNA. DRAWN BY E. A. RICKARDS.

Views and Reviews.

Fletcher's "Light and Air."

The fifth edition of Messrs. Fletcher's very useful treatise on "Light and Air" has been revised and re-written in accordance with the trend of current judicial opinion. The case of *Kine* v. *Jolly* being thought to modify the judgment in the leading case of *Colls* v. *Home and Colonial Stores*, both these actions are fully reported in the book, and the authors acknowledge in the preface, though not on the title-page, their indebtedness for the assistance given in the revision of the present edition by Mr. Richard Sillem, barrister-at-law. The questions at issue in various law cases in which light-and-air rights have been more or less authoritatively determined, are illustrated in a series of twenty-seven plates, which, together with the careful digest and brief but luminous discussion of many typical actions, seem to meet all conceivable conditions with respect to light and air, and render the volume very interesting, as well as extremely serviceable, to architects, builders, and building owners.

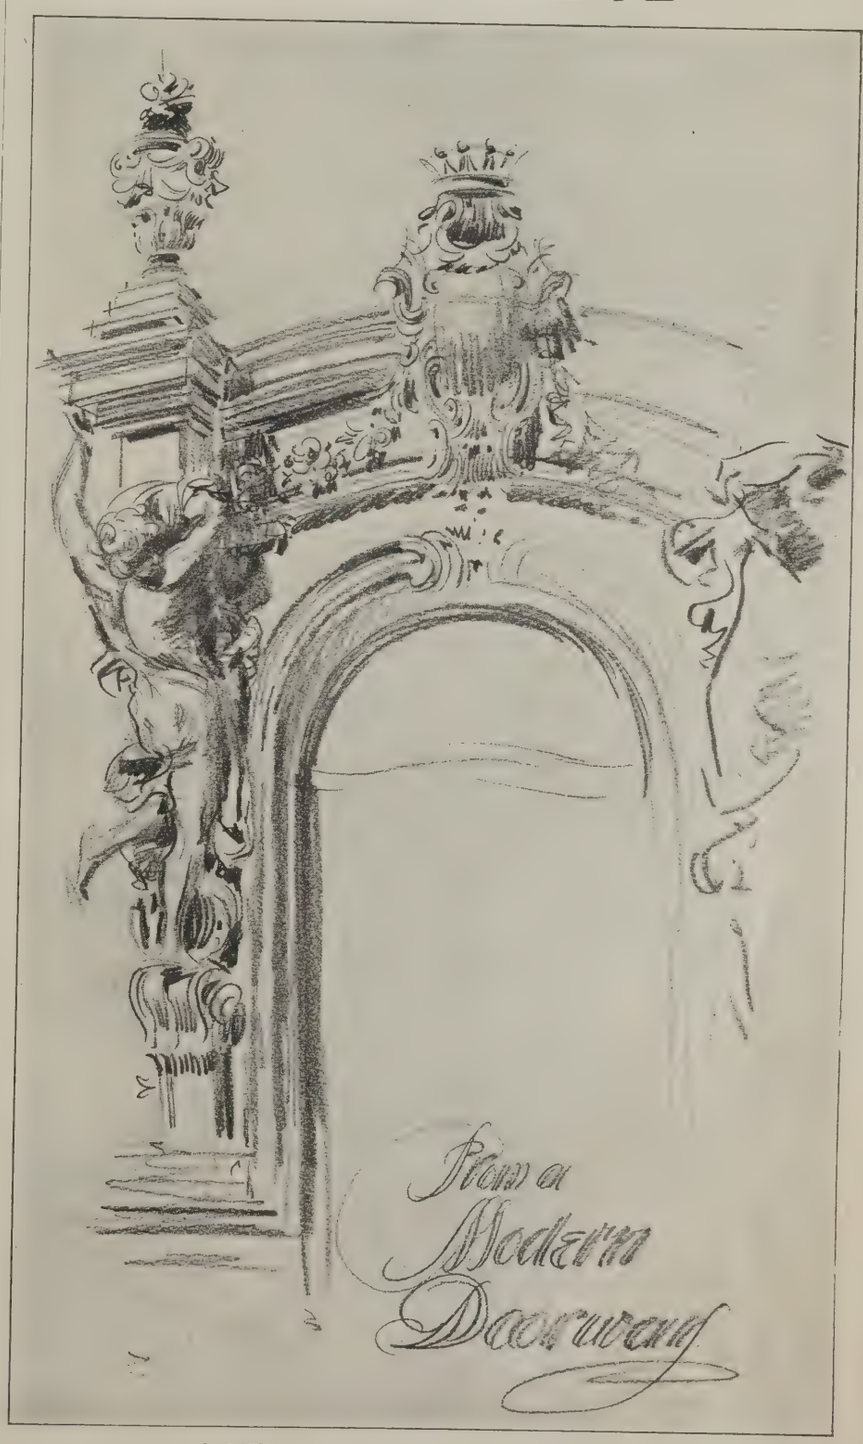
"Light and Air." A Textbook in tabulated form, for Architects, Surveyors, and others; showing what constitutes ancient light, how the right is acquired, jeopardised or lost; injuries without remedy; the relative position of servient and dominant owners. By the late Professor Banister Fletcher, F.R.I.B.A. Fifth Edition, revised by Banister F. Fletcher, F.R.I.B.A., and H. Phillips Fletcher, F.R.I.B.A., Barrister-at-Law. With numerous diagrams, on twenty-seven plates. London: B. T. Batsford, 94, High Holborn; 6s. 6d.

Cast-iron Drainage.

In New York, and in many other cities of the United States, Mr. Jensen observes, it is compulsory to construct house drains of iron to a distance of 10ft. on the sewer side of the intercepting trap, beyond which point stoneware piping may be used. He of course desires to see what he calls the cast-iron drainage system extended, and he claims many advantages for cast-iron pipes, but is bound to admit that they are from ten to thirty per cent. more costly than stoneware. The author's treatment of the subject is rather too discursive, but is quite thorough, and his book, with its 185 illustrations, affords sound as well as complete practical guidance in the details of house-drainage on the system advocated.

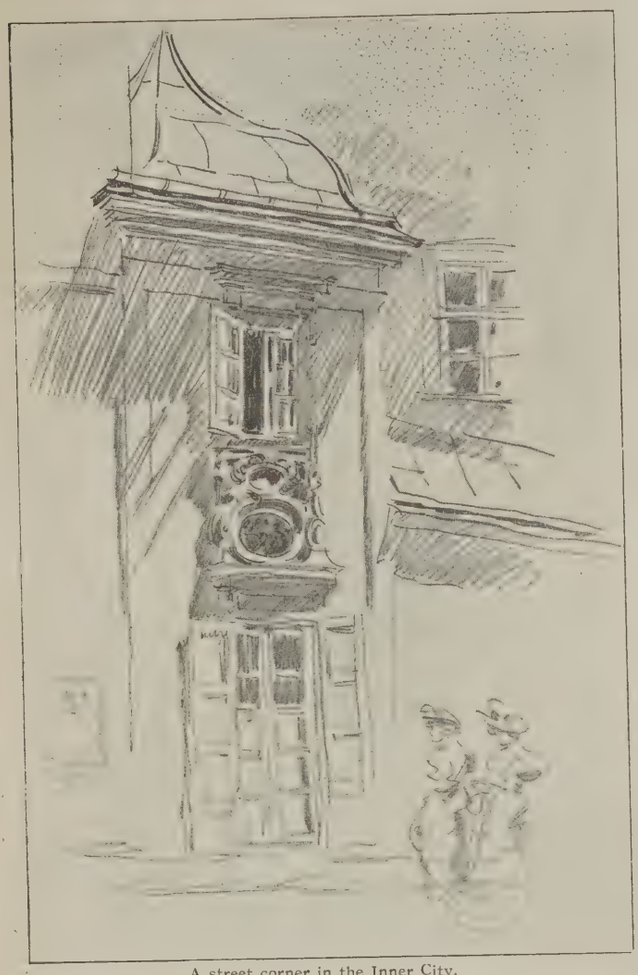
"Cast-iron House Drainage," with special reference to the drainage of town houses. By Gerard J. G. Jensen. With numerous illustrations. London: The Sanitary Publishing Company, Ltd. Price 4s. 6d. net.

Utility and Ornamentation.



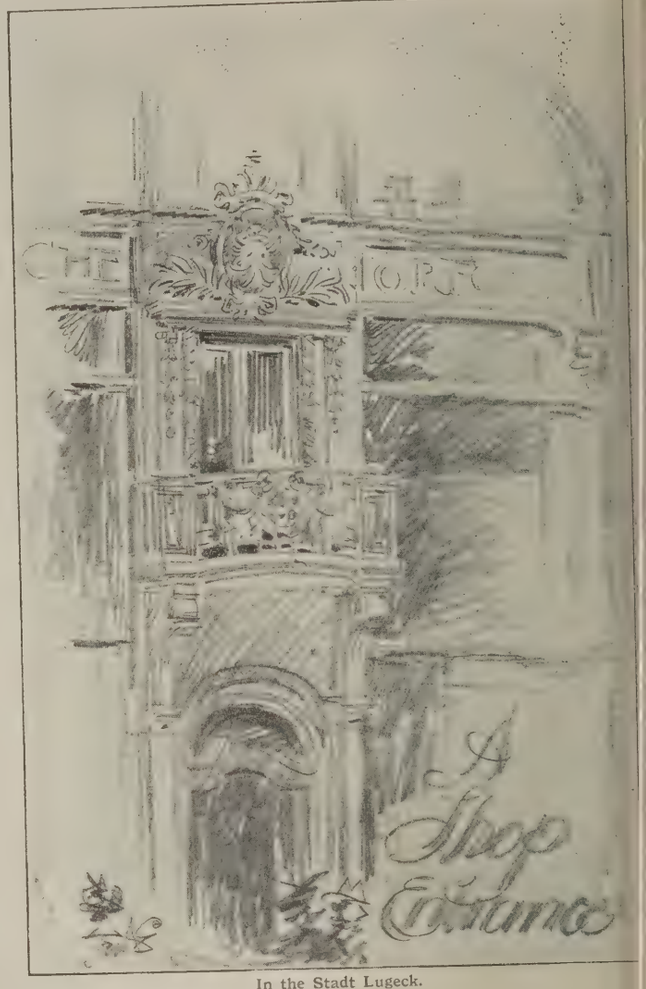
"The Handyman's Enquire Within" professes to do "for the handyman what well-known and popular volume has done for the housewife. When in difficulty about any little job in the house, he has only to enquire within its pages, to find just the information he needs." Certainly, there is a good deal of miscellaneous information that redeems this promise; but there is also a considerable amount of matter of which the utility is by no means obvious—for instance, that which appears under the heading "Egg-shell Ornamentation," where the advice seems quite superfluous, while the illustrations of suggested "ornamentation" are perfectly hideous. The same observation applies with full force to some frightful examples of crazy china work, and to some very distressing designs for carved walking-stick handles. Clearly, the handy-man should not be encouraged to attempt ornamentation.

"The Handyman's Enquire Within. Making, Mending, Renovating." Edited by Paul N. Hasluck. London: Cassell and Co., Ltd. Price 7s. 6d. net.



Heating and Ventilation.

Manuals on heating and ventilation are rapidly becoming so numerous as to create some embarrassment of choice. Mr. King's book is of American origin, and, as might be expected, it deals with certain phases of practice that are not very familiar in our own country. This is not altogether a disadvantage, as a careful study of American methods may conceivably result in improvements at home. The art of artificial heating being now, as the author claims, almost an exact science, the chief value of such a book must consist in the clearness with which principles are enunciated, mere details being entirely subordinate, and in this respect the author appears to be a trustworthy and competent guide. His glance at the history and development of the so-called science serves a useful purpose in emphasising modern improvements on the earlier methods. The book is abundantly illustrated, and contains many useful tables and a good index.



"Practical Steam and Hot-Water Heating and Ventilation." By Alfred G. King. Containing over three hundred specially made illustrations, showing in detail all the various heating systems. London: Crosby Lockwood and Son. New York: The Norman W. Henley Publishing Co. Price 12s. 6d. net.

A SKETCH IN VIENNA, BY E. A. RICKARDS.

A street corner in the Inner City.

In the Stadt Lugeck.

TWO SKETCHES IN VIENNA, BY E. A. RICKARDS.

POINTS IN FACTORY VENTILATION.*

By J. S. Haldane, M.D., F.R.S.

Dust, fumes, vapours, and gases are produced in a great variety of manufacturing processes, and as they are nearly all more or less noxious, though in very varying degree, the problem of their prevention or efficient removal is one of much importance. My own attention has been specially directed to the subject in connection with the work of the late Home Office Committee on Factory Ventilation, of which I was a member. This Committee has published two reports (in 1902 and 1907), the first dealing with general ventilation, and the second with the removal of dust and fumes, and with high temperatures.

Injurious Dusts.

Of dusts which are definitely harmful, one very important class is that from the disintegration of hard stone or other material. An instance of this is the dust made in the dressing of hard stone. Another dangerous kind of dust is that from poisonous material of any kind. Of more or less poisonous dusts there are many varieties, but the most important kind is lead in any soluble form, and in the manufacture of white lead itself great care is needed.

Fumes and Vapours

from chemical processes are commonly so unpleasant and irritant in their effects that the necessity of their removal is evident. The vapour of water perhaps needs special mention, as it is so commonly allowed to escape into rooms in the form of steam. A moderate addition of water vapour to the air of a room is often of no importance, provided that no moisture condenses in such a way as to cause damp. If, however, the temperature of a room is high, the addition of water vapour to the air may make it very oppressive. I have recently made many experiments on this point, and find that when the temperature and proportion of moisture are sufficient to raise the wet bulb thermometer above about 70 degrees, considerable oppression begins to be felt in still air with ordinary indoor clothing, which soon becomes more or less wet from perspiration.

Poisonous Gases.

The most important of these is carbonic oxide, which, besides being a constituent of lighting and fuel gas, is present in smoke, the products of imperfect combustion of fuel or fuel-gas, etc. Poisonous gases, if formed in manufacturing processes, ought always to be carried off by proper flues or exhaust ducts, and should never be allowed to escape into the air of a room at all.

Prevention of Du t Formation.

In many cases the best way of dealing with dust is to prevent its formation altogether. This can be effected by substituting wet for dry processes. Dangerous dust can often be dealt with in this way in particular the dust from disintegrati of hard stone or steel. Thus the use of jet of water prevents dust formation rock-drill and other work in tin a granite mining. It is to be hoped that all cases where dust from disintegrati of hard stone, fire-clay bricks, and simil material, is apt to be inhaled, wet metho will also be adopted where possible.

Prevention of Escape of Dust.

When dust formation cannot avoided, its escape can sometimes be p vented by entirely boxing-in the du process. Where the dust is itself the p duct of the process, as in the grinding breaking up of material, efficient boxi in is an advantage to the process itself well as to the persons employed in it.

In processes where fumes or noxi vapours are emitted closed vessels ou also to be used wherever possible, and closed vessel, or a boxed-in machine also connected with an exhaust pipe fumes or dust are prevented from esc ing at times when the vessel or mach has to be opened.

Removal of Dust.

In most cases it is, unfortunately, possible either to prevent the formatio dust or to box in the dusty process c pletely, and the only method availab to draw away the dust by means of an current. There are certain general p ciples applicable to the removal of du this way. In the first place, the

* Abstract of a lecture delivered before the Society of Arts.

ought to be removed at, or as near as possible to, the point of origin. The advantages of this are evident; for by this means the dust is prevented from getting into the general atmosphere of the room and being inhaled by those present, as well as settling everywhere. A far smaller volume of air is also sufficient to remove the dust. This is important, not only from the point of view of expense, but because draughts and cold are also prevented. When dust is permitted to get into the general atmosphere of a factory, enormous volumes of air are required to carry it away, which means that equal volumes have to come in from outside, so that warming or prevention of draughts may be quite impractible.

A second general principle is that the air current from the source of dust to the exhaust opening should, as far as possible, envelope the source of dust, and be of sufficient velocity to carry the dust with it in spite of the ordinary slight draughts existing in the room, or produced by the dusty machine.

A further important principle is that as all dust tends to fall, it is often best to remove it in a downward direction. This applies particularly in cases where the air-current carrying the dust towards the exhaust opening is very slow.

It must not be forgotten, finally, that when exhaust ventilation is used for removing dust, provision must be made for corresponding inlet ventilation to the room, the air being warmed, if necessary. It is not uncommon to see exhaust ventilation rendered partially inoperative by failure to provide proper inlets.

Arrangement of Ducts for Exhausting Air.

The air-currents used for exhausting air are nearly always produced by fans.

It is evident that the greater the sectional area of an air-duct is the lower the velocity at which a current of a certain number of cubic feet per minute will pass, and consequently the less work (in proportion to the square of the velocity) will be needed to move it. There is, however, little advantage in increasing the cross-section of a duct to much more than the cross-section of the fan opening, as additional velocity would then have to be given to the air as it passed through the fan, with corresponding increase in resistance. Nor would it, as a rule, be an advantage to increase the size of the fan so as to permit of a low velocity through it, as in such a case the current is easily reversed by wind. The space occupied by the ducts and fan is also a material consideration. Any obstruction or narrowing in a duct will correspondingly increase the velocity, and therefore still more the resistance, so that all obstructions should be avoided, including those due to deposits of dust. Any sharp bend converts into heat the energy of motion possessed by the moving air, and an equivalent quantity of energy of motion has again to be communicated to the air beyond the bend. A sharp bend may thus double the resistance, and ought to be avoided if possible. A gradual bend causes much less extra resistance.

Roughly speaking, the cross-section of the duct or its combined branches should be about equal to that of the fan opening; and if a centrifugal fan, capable of overcoming considerable resistance, is used, the duct may be much smaller, and the air-velocity in it much higher, than if a propeller fan is used. A propeller fan can only work against small resistance, while a centrifugal fan is adapted for much greater resistances. On the other hand, the horse-power required for the centrifugal fan is greater, in correspondence with the greater velocity of the air-current and consequent greater resistance.

Bad Arrangement of Ducts.

A main point to be attended to in the arrangement of ducts for exhausting dusty air, or for blowing air in, is the avoidance of resistance due to sharp bends or constrictions, and the accompanying inequalities of flow in branch ducts.

Fans for Removal of Dust.

The air-currents used for the removal of dust are nearly always produced by fans. Two types of fans are employed—the "propeller" and "centrifugal" fan—and the one or the other is more advantageous according to circumstances. Roughly speaking, the propeller fan is best adapted for moving large volumes of air against very small resistance, while the centrifugal fan is necessary when the resistance is at all considerable. A propeller fan 2ft. in diameter will deliver air at the rate of 170,000 cub. ft. of air per hour with a linear velocity of 900 ft. per minute, and an expenditure in power at the rate of only about a tenth of a horse-power. For any given expenditure of power much more air is, of course, delivered with a low than a high rate of speed, but in practice it is usually necessary to run a propeller fan at a pretty high speed, otherwise the air-current may be very easily diminished, or even reversed by wind. The retarding influence of wind may, of course, be prevented by carrying the outlet up to the roof of the building, but this is often inconvenient or impossible. On account of the serious influence of wind, resistances in ducts, etc., on propeller fans, centrifugal fans are often preferable to propeller fans, particularly for the removal of dust. They also permit of much narrower and less bulky ducts, and air-velocities which prevent choking of the ducts with dust.

It is clear that the openings of the centrifugal fan are at the best considerably smaller than that of a propeller fan. The air has also to change its direction abruptly in passing through the centrifugal fan. Hence the internal resistance of a centrifugal fan is much greater than that of a propeller fan of equal diameter; and if the external resistance to the flow of air is very small, this internal resistance greatly diminishes the volume of air moved by the fan. If, on the other hand, the external resistance due to ducts, etc., is high, the internal resistance is of very little importance. In the centrifugal fan there is no tendency to leakage backwards at one part of the blades, as in the propeller fan. Hence the centrifugal fan will overcome resistances against which a propeller fan revolving at same rate would be powerless. In short, the centrifugal fan works advantageously against moderate or high resistances, while the propeller fan is only suited for very slight resistances, against which it works more advantageously than a centrifugal fan.

CHANGE OF ADDRESS.—Messrs. C. A. Peters, Ltd., manufacturers of "Carbolineum Avenarius," "Antixoide," "Scalo," and other trade specialities, have removed their London offices from 68, Queen Street, Cheapside, to larger premises at 116, Newgate Street, E.C., in order to cope with the great increase in their business.

LANCASHIRE, CHESHIRE, AND NORTH WALES BUILDING TRADES EMPLOYERS' FEDERATION.

Annual Meeting at Blackpool.

The annual general meeting of this Federation was held at Blackpool on June 22nd, when Mr. Henry Matthews, J.P., Manchester, presided over a fair attendance of representatives from the federated towns.

The annual report, giving a record of the working of the federation for the half-year ended May 31st, 1908, was adopted for circulation amongst the members, together with the annual statement of accounts, which shows the federation to be in a very favourable position financially.

Mr. William Bullen, of the firm of Messrs. Bullen Bros. and Sons, Ltd., building contractors, Liverpool, was elected president for the ensuing year, on the motion of the chairman, seconded by Mr. S. Smethurst, J.P. Mr. Bullen, on taking the chair, thanked the members for electing him president, and proposed that the best thanks of the meeting be tendered to the retiring president (Mr. Henry Matthews, J.P.) for the valuable services he had rendered during his term of office. This was seconded by Mr. S. Smethurst, and carried unanimously. Mr. Matthews then thanked the meeting for the vote passed.

The chairman (Mr. Bullen) next referred in sympathetic terms to the death of the late junior vice-president (Mr. William Townson, of Bolton), and proposed that a vote of condolence and sympathy with his family be recorded in the minutes of this annual meeting, which was agreed to by the members standing in silence.

Mr. William Cooke, jun., of Preston, was elected senior vice-president, and Mr. Thomas Meadows, of Stockport, junior vice-president. Mr. Walter Marshall, of Manchester, was re-elected hon. treasurer, and Mr. Frank Woods, of Bolton, and Councillor T. Woolfenden, of Rochdale, were appointed hon. auditors.

The Administrative, Insurance, and Finance Committees were appointed for the year.

The new rules on the subject of the affiliation of honorary members and of branch trade associations in towns where there is a General Trades Association were adopted, after notice having been given.

It was decided to reprint the rules of the Federation, and the matter has been left in the hands of the Administrative Committee for a general revision thereof.

Several other matters of importance were considered at this meeting, including a proposed arbitration rule between scle and sub-contractors, and proposals for equal representation of the branch trades on the Executive Board, the former being approved and the latter allowed to drop.

Before the close of the meeting the chairman and Mr. S. Smethurst made reference to THE BUILDERS' JOURNAL, and stated that the National Federation had now entered into agreement with the publishers that the same be appointed as their sole official organ. Mr. Percy Hastings, the managing director, who was present, addressed the meeting, after which a resolution was passed in support of the JOURNAL.

This concluded the business. Subsequently the representatives were entertained at dinner by the members of the Blackpool Local Association.

Notes and News.

A CONVALESCENT HOME is to be erected at Worthing in connection with the Royal Surrey County Hospital, Guildford, at a cost of £10,000.

* * *

THE PRESERVATION OF WOOD.—Among the exhibits at last week's conversazione of the Royal Society were some of the beechwood logs taken from the foundations of Winchester Cathedral. One of them had been polished, and the wood showed as hard and true as when put into place 700 years ago. Still earlier relics were some Norman oak piles, dating back to 1079.

* * *

QUEENSLAND HARDWOODS FOR THE CONTINENT.—A trade has recently sprung up between the Colony of Queensland and the Continent of Europe for hardwoods for wood paving. The Brisbane papers to hand announce that a shipment of 40,000ft. of wood-blocking was despatched by a vessel to the Continent, and that another similar lot was to follow in a week.

* * *

LIVERPOOL'S NEW BUILDING AT THE PIERHEAD.— At last week's meeting of the Liverpool City Council Mr. Cohen stated that nothing further had been done regarding the sale of the central portion of the George's Dock site, excepting the signing of the contract. Plans and designs of the building which is proposed to be erected thereon had not yet been submitted to the Finance Committee.

* * *

A SANITARY SECTION AT THE FRANCO-BRITISH EXHIBITION is the subject of a memorial which has been presented to the Exhibition authorities by the Sanitary Assurance Association, who urge that the very success of the effort to make the Exhibition representative of Science, Arts, and Industries emphasises the absence of adequate representation of Hygiene. The Association suggests that the several sanitary institutions and manufacturers of sanitary appliances should be invited to a meeting to consider the matter.

* * *

THE RECONSTRUCTION OF VICTORIA STATION, which was practically completed last week by the opening of platforms 1, 2, 3, and 4, has occupied eight years. The new station has an area of nearly 16 acres, and its length (1,500ft.) is nearly double that of the old station. The facade to the station yard forms an extension to the Grosvenor Hotel, with the main line booking hall (120ft. by 70ft.), waiting-rooms, and other offices, on the ground floor. The entire work has been carried out from designs by Mr. Charles L. Morgan, chief engineer to the Brighton Co.

* * *

THE NEW UNIVERSITY BUILDINGS AT LEEDS, which were formally opened yestesday by His Majesty the King, have been designed by Mr. Paul Waterhouse, F.R.I.B.A., who has continued the work of his father, the late Mr. Alfred Waterhouse, R.A. The original group of buildings was known as the Yorkshire College, and the additions consist of a large wing facing College Road, which will contain the arts lecture rooms as well as the botanical department; a one-storey building of a more or less temporary character to accommodate part of the physics and chemistry schools, now greatly overcrowded; a complete building for mining, fuel, and metallurgy; another complete and self-contained block for electrical engineering; a new boiler-house; and an extensive addition to the department of mechanical engineering. The contractors were Messrs. Armitage and Hodgson, of Leeds, and Messrs. Longden and Sons, of Sheffield.

* * *

THE NEW BUILDING OF THE ROYAL NATIONAL PENSION FUND FOR NURSES, which was opened by the King and Queen on Saturday, occupies a site at the foot of Buckingham Street, Strand, facing the Embankment. It has been erected from designs by Mr. Paul Waterhouse, F.R.I.B.A. The contractor was Mr. J. Carmichael. Messrs. George Jackson and Sons, of Rathbone Place, reinstated the old ceilings and panelling; Mr. A. Whitehead, of Leeds, carried out the faience; and Messrs. H. H. Martyn, of Cheltenham, executed the stone and other carving.

* * *

HEATING BY THE CABLE SYSTEM is the subject of an attractive booklet which has just been issued by Messrs. Richard Crittall and Co., of 197, Wardour Street, Oxford Street, W., where a show system is now ready for inspection. The outstanding features of the system are thus set forth:—It is a low-pressure apparatus, yet has extremely small pipes (from ¼in. upwards); no excavation for the boiler is necessary, nor channels for the pipes; the system is automatically self-regulating, water being circulated at any desired temperature without pumps, and absolutely irrespective of levels.

* * *

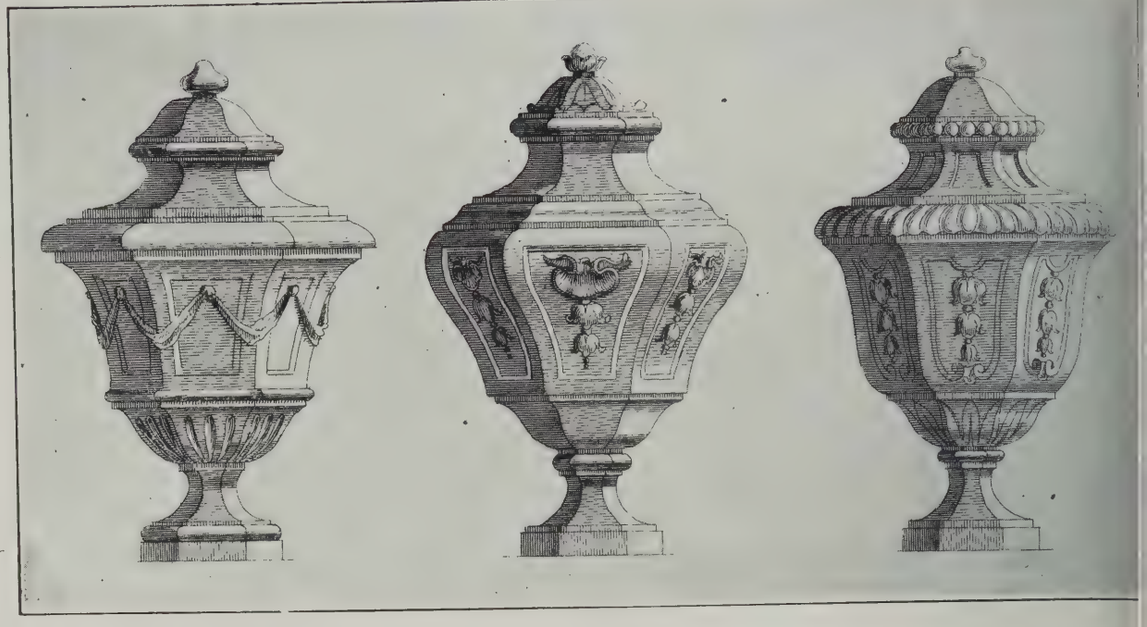
THE ORGAN IN THE GREAT HALL OF DULWICH COLLEGE has recently been reconstructed and enlarged, new fronts and cases being at the same time added—through the munificence of Canon Carver, D.D., formerly headmaster of the College. The organ is symmetrically arranged on two opposite sides, at the western end of the hall, and flanking the stage. The cases are designed in the Renaissance style of the late 17th century, and are executed in oak with carved aprons and panels and with metal pipes. The work has been carried out by Messrs. Walford and Spokes, of Oxford, from the designs of Mr. W. H. Atkin Berry, F.R.I.B.A.

* * *

COMBINATION IN THE STEEL TRADES.—During the past fortnight considerable progress, it is claimed, has been made with the prosecution of the scheme for the formation of a British Constructional Steel Combination. Steelmakers in England and Scotland, it is understood, are distinctly favourable to the new arrangement; but in order to make it effective they argue that the distribution of plates, as well as of sectional material, should be included in its scope. It is now stated that as a basis of co-operation the Bridge-builders' and Constructional Engineers' Association ask that they should receive a price-preference over firms that refuse to throw in their lot of 5s. a ton; and they, on their part, undertake to place all their requirements with those British producers who are members of the corresponding steel combination. If these conditions can be effectively applied there will be created on the one hand a powerful consumers' organisation, and on the other an equally strong producers' organization—two bodies which, it is claimed, would ultimately control buying and selling prices in the United Kingdom. There are many details to adjust, but it is hoped that by August, when a united conference of parties is to be held in London, such progress will have been made as to justify active action being taken towards the constitution of a fixed agreement.—"Times," July 4th.

* * *

THE "RAILROAD" AND THE "DUMBBELL" DWELLINGS OF NEW YORK, as described at the Pan-Anglican Congress by an American named John W. Wood, appear to be slum hovels of the first order. These two early types of tenement house were commonly on the east side of New York. The "railroad" dwelling was a long narrow block, in which many of the rooms were absolutely shut off from daylight and fresh air. The law forbade any more of the railroad type to be built, and enacted that every room must have a window opening to the outer air. The builders got over this by evolving the "dumbbell" type, which was built with a central court; but this court was usually from twenty to thirty inches square only and it was easy to estimate the efficacy of that in lighting and ventilating rooms in the lower storeys of tall tenement buildings. Such things as water or sanitary accommodation were non-existent and property owners declared that it was impossible to provide them for working people. However, a new law was passed by the Legislative Assembly of the State of New York which had done something and improvements were being slowly made. Some of the old "railroad" and "dumbbell" tenements had been pulled down, and their sites converted into open spaces, and private corporations had begun the work of providing cheap and healthy homes for the working-classes in East New York.



Our Plate.

Some Designs for Architectural Vases, by James Gibbs.

Gibbs was particularly careful in his designs of details. This is evident in the series of designs for architectural vases which we publish this week. Many of them are quite beautiful in outline and in their enrichment, and now that such vases are so much favoured, either as decorative features on buildings, or as embellishments to the garden, we are sure the designs will be studied with much interest.

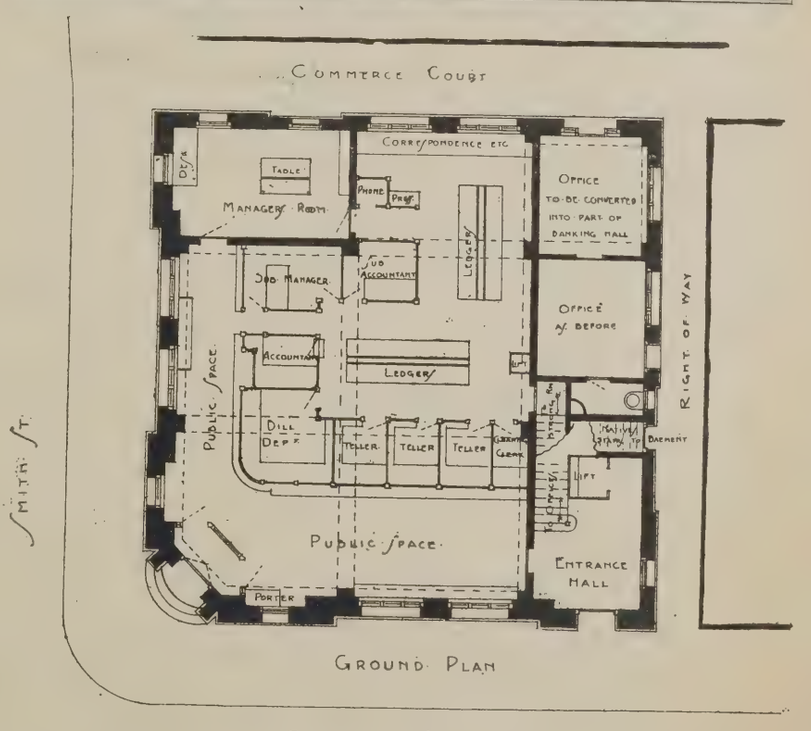
A 62-STOREY BUILDING.

Plans for a gigantic building in New York, to be the loftiest in the world, overtopping the tower of the Metropolitan Life Co. in Madison Square by 200ft., and the Singer building by 300ft., were filed with the city authorities last week. The new building is to be the home of the Equitable Life Assurance Society, and will directly face the Singer building. It will have sixty-two storeys, and will be 900ft. above the kerb. The new structure will cost £2,000,000 sterling. The facades are to be of brick and granite, with dressings of terra-cotta. The design will be of the Renaissance type, presenting bays set between great Corinthian and Doric pilasters, the corners being offset with clustered columns. There will be 32 passenger lifts. This skyscraper of steel scrapers will come within a few feet of the Eiffel Tower, the highest structure ever reared in the Age of Steel.

L VASES, BY JAMES GIBBS.

Obituary.

MR. A. E. GOUGH, A.R.I.B.A., of the firm of Giles, Gough and Trollope, died recently, aged 66, from apoplexy.



MR. F. H. OLDHAM, F.R.I.B.A., architect, of Manchester, died on June 30th. He served his articles with the architect of the late Duke of Portland, and engineer to the River Witham and Everton drainage schemes. When 26 years of age he went to Manchester, and joined Mr. W. Wilson in partnership. He achieved a high place in his profession, and was twice president of the Manchester Architectural Association before its amalgamation with the Manchester Society of Architects. His practice was an extensive one, embracing not only the Manchester district, but many parts of Yorkshire.

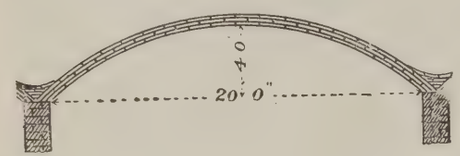
THE LATE MR. L. G. MOUCHEL, who died on May 27th, aged 56, left estate which has been valued at £79,570 gross, with nett personalty £68,384. Mr. Mouchel, who was unmarried, formed his London business in Hennebique Ferro-Concrete Construction into a company in 1907 to enable members of his staff to participate in the business, and he directed that his holding in the company should be offered at par, and his holdings in the various ferro-concrete companies and syndicates in which he was concerned at their fair or market value, to the other shareholders in the company. The residue of his property the testator left as to one-tenth (over £6,000) equally between Dr. Barnardo's Homes, the Salvation Army for general purposes of that institution, the Civil Hospital at Cherbourg, the Bureau de Bienfaisance, Cherbourg, L'Etablissement des Orphelines de St. Marie, Cherbourg, and La Société de Secours des Nauffrages de France, Paris.

MR. JOHN BEST, a well-known Edinburgh contractor, died on June 30th, aged 59. During his career Mr. Best managed operations in connection with the Monkland railway, the Broughton and Peebles Branch railway, the Govan graving dock, the Albert Dock and Edinburgh Dock and Imperial Dock at Leith, the Gouthwaite reservoir for the Bradford Corporation, the Strome to Kyllachan line, the Ballachulish line (including the foundations for the bridge over Loch Etive and the Creggan bridge), the Blair Athol to Dalnaspidal line, the pier at Newhaven, a portion of the Water of Leith sewer, the railway for the Cork, Blackrock Package Railway Company, and the Loch Erne drainage scheme in Ireland, and harbour work at Haulbowline for the Admiralty. At the time of his death works of which he had charge and which were in course of construction were a graving dock at West Hartlepool for the North-Eastern Railway Co., the Angram Reservoir for the Bradford Corporation, the Delph Reservoir for the Bolton Corporation, and the construction of new gates and locks for the old docks at Leith. For some years past Mr. Best was actively engaged in connection with the Talla Water Works for the supply of Edinburgh's water, and he lived to see the completion of the undertaking.

NOTICE. — The index to Vol. 27 of THE BUILDERS' JOURNAL is now ready and can be obtained from the Publisher, 7, Great New Street, Fetter Lane, E.C., post free for 1d.

NATIONAL BANK BUILDING, DURBAN. REGINALD G. KIRKBY, A.R.I.B.A., ARCHITECT.

This building occupies an important site in the centre of Durban, opposite the new town hall and municipal buildings. The elevation is faced with Portland cement and white sand, the cost of stone being in this case prohibitive. The interior of the building is of steel construction, well tied into the outer walls. Considerable difficulty was experienced with the foundations, owing to beds of running sand, but the difficulty was overcome by forming a concrete raft, 2 ft. thick, over the whole site. The architect was Mr Reginald G. Kirkby, A.R.I.B.A., formerly of Durban, but now in this country. The contractor was Mr. W. E. Johnstone, of Durban. Tile-work was supplied by Messrs. Carter and Company, of Poole, Dorset, and by Messrs. Molkin, of Burslem, while Messrs. Spital and Clark, of Birmingham, executed all the bronze panels, grilles, and electric-light fittings.



Correspondence.

"A New Method of Building with Tiles."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to the correspondence in your columns relative to the above, and to a notice that a patent has been taken out for what is called a new development in constructing roofs with roofing tiles by cementing three or more courses together, I would remark that this is a very old system. Louden, in his "Encyclopædia of Cottage and Villa Architecture," published more than seventy years ago, mentions the practice, but suggests that an embedded lattice of iron rods should be used, by which means flat floors could be formed—an anticipation of reinforced construction.

Major-General Pasley, in his "Limes and Cements," written in 1838, says that roofs formed with three thicknesses or courses of plain roofing tiles were in common use at that period, and gives an illustration of one 20 ft. span (reproduced)

adopted for roofing some stables in Oxford Terrace, Paddington. The writer says that three courses are of ample strength for spans up to 20 ft., the total thickness being about 2 ins.

I agree with your correspondent that this simple and light form of roof construction has much to commend it. Obviously roofs of this description would have to be asphalted.

THOMAS POTTER.

Law Cases.

FINES FOR CONTRAVENTION OF BY-LAWS.—At Wakefield, on July 1st, Thomas Makin, builder (a former member of the City Council) was fined 10s. and 8s. costs for failing to give notice to place water fittings in some property in course of erection at Westgate End.—At Sheffield Tom Andrews, builder, was fined 10s. for failing to fence in some excavations in Newbury Road; he was also fined a similar amount for omitting to put up a hoarding upon some property in course of erection at Bosworth Street. Another builder, Ernest Hancock, was fined 10s. for not fencing in some excavations at New Lane, Sheffield.

A "PERMANENT BUILDING" ON WHEELS, AND A "GILBERTIAN SITUATION."—At Torquay on July 2nd, Frederick Richards was summoned by the Town Council for a breach of the Public Health Act, and also of the borough by-laws, by the erection of a building at the entrance to his gardens. The question raised was whether the structure was a building within the meaning of the Act. It was a wooden structure, and the by-laws provided that all buildings should be of incombustible material. Instead of being let into the ground, the structure was placed on four wheels. It was nevertheless, prosecuting counsel contended, a permanent structure. It was used as a shop for the sale of fruit, vegetables, and sweetmeats. Mr. H. A. Garrett, borough surveyor, in cross-examination, admitted that the kiosk in the King's Gardens, the property of the Town Council, and let by them for the sale of refreshments, was a building of somewhat similar character. Defendant said that if permitted he would have put up a structure of stone or brick.—Mr. H. C. Goss, builder, said he should not regard the structure as a permanent building. It would be very easy to move it at any time.—Defendant's counsel contended that the building was not one to which the by-laws applied. The Act applied to buildings used as human habitations, but in this building there were no means for artificial lighting or artificial heating, and there was no drainage. A Gilbertian situation had been created, for whilst in the first place defendant wished to put up a stone or brick building, the Town Council refused to permit it, yet when he erected this structure they proceeded against him for not having put up a brick or stone building. The Bench decided that the structure was a building within the meaning of the Act, and fined defendant 5s. and costs, but agreed to state a case.

New London Buildings.

The following applications came before the London County Council at their meeting yesterday. Consent or refusal, as recommended by the Building Act Committee, is indicated in italics in each case:

Erection of a lych gate at St. Andrew's Church, Greyhound Road, Fulham, on the application of Mr. A. C. Forrester, on behalf of the vicar and churchwardens (*consent*).

Erection of an iron and glass shelter in front of the Shooter's Hill and Eltham Park Railway Station, Westmount Road, Plumstead, on the application of Mr. J. W. Watkin, on behalf of the South Eastern and Chatham Railway Company (*consent*).

Re-erection of the "Queen Adelaide" public-house and the erection of four shops immediately to the westward, on the northern side of Uxbridge Road, Hammersmith, on the application of Mr. C. G. Miller, on behalf of the Lion Brewery Company, Ltd. (*consent*).

Erection of a one-storey building on the western side of Rosendale Road, Norwood, on the application of Mr. A. Whitelaw, on behalf of the London and North-Western Railway Company (*consent*).

Rebuilding of the Trinity Presbyterian Church, abutting upon Buck Street, Kentish Town Road and Union Terrace, St. Pancras, on the application of Mr. J. A. Macdonald, on behalf of the trustees of the church (*consent*).

Erection of bay-windows to thirteen houses on the eastern and western sides of Steep Hill, Streatham, on the application of Messrs. Ellyatt and Porter (*consent*).

Erection of a one-storey shop in front of No. 33, Frederick Place, Woolwich, on the application of Messrs. Church, Quick and Whincop, on behalf of Mr. J. B. Harthan (*consent*).

Erection of a parish hall on the northern side of Old Mill Road, Plumstead, to abut also upon the western side of Tormount Road, on the application of Mr. C. H. M. Mileham, on behalf of the vicar and churchwardens of St. Mark's Church (*consent*).

Erection of a building on the northern side of Baldwin's Place, Holborn, to abut also upon the southern and western sides of Verulam Street, on the application of Messrs. Sheppard and Bullock, on behalf of Messrs. Willmott and Sons (*refusal*).

Erection of a building upon a site on the eastern side of Betts Street, St. Georges-in-the-East, on the application of Mr. S. D. Adshead, on behalf of Messrs. A. Barber and Sons (*consent*).

Erection of a building on the northern side of Ben Jonson Road, Stepney, to abut also upon the eastern side of Stepney Square and the western side of St. Thomas' Yard, on the application of Mr. E. Jackson (*consent*).

Erection of a building on the north-eastern side of Margravine Road, Fulham, to abut also upon the southern side of St. Alban's Terrace, on the application of Messrs. Aston Webb and E. Ingress Bell, on behalf of the vicar and churchwardens of St. Alban's Church (*consent*).

Erection of a two-storey oriel window and railing in front of No. 1, Streets Mews, Aldford Street, Mayfair, on the application of Mr. G. A. Codd, on behalf of Mr. H. R. Read (*refusal*).

Erection of a fourth floor and loft addition at No. 68, Curzon Street, Mayfair, on the application of Messrs. Emden, Egan and Co., on behalf of Mr. G. J. Toby (*consent*).

Erection of two houses on the eastern side of Normanhurst Road, Streatham, with irregular open spaces at the rear (*consent*).

Erection of three one-storey shops on the Uxbridge Road frontage of Nos. 271 and 273, Uxbridge Road, Hammersmith, two onestorey shops on the flank frontage next Askew Road, a fireproof staircase block to give access to Nos. 271 and 273, Uxbridge Road, a block of three shops on the western side of Askew Road, and to an irregular open space at the rear of Nos. 271 and 273, Uxbridge Road, on the application of Mr. C. D. Cox, on behalf of Mr. H. E. Barley (*refusal*).

Formation or laying out of a new street for carriagt traffic to lead from Woodwarde Road to Townley Road, Dulwich, on the application of Messrs. H. J. Williams and Sons (*consent*).

Erection of an iron and glass roof at the Kensington High Street station of the Metropolitan District Railway, on the application of Mr. G. Sherrin, on behalf of the Metropolitan District Railway Company (*refusal*).

Erection of five shops and dwelling-houses on low-lying land situated at Nos. 59 to 69, Old Kent Road, on the application of Mr. F. W. Foster (*consent*).

Notes on Competitions.

Baptist Church and Schools, Leeds.

In the limited competition for a new Baptist church and schools at Headingley, Leeds, estimated to cost £8,500, the design submitted by Messrs. Percy Robinson, F.R.I.B.A., and W. Alban Jones, joint architects, of Leeds and London, has been selected. The assessor appointed by the Committee was Mr. W. H. Thorp, F.R.I.B.A. The new buildings are Gothic in style, to be carried out in brick with stone dressings. The church will provide accommodation for 500, with schools, gymnasium, and church parlour etc. The site is a corner one at the junction of Cardigan Road with Kirkstall Lane.

New Secondary Schools, Tiverton.

No fewer than 217 designs have been submitted in this competition. The assessor is Mr. C. Harrison Townsend F.R.I.B.A.

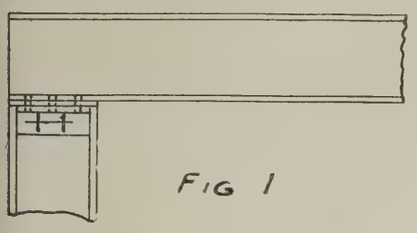
Islington Workhouse Extension.

In the competition for extensions to the receiving wards and the erection of new vagrant wards at the Islington Workhouse in St. John's Road, the assessor (Mr. Lewis Solomon) has reported in favour of the design submitted by Messrs. Greenaway and Newberry, of Westminster. The assessor's report is under consideration by the Accommodation Committee. There were seven competitors.

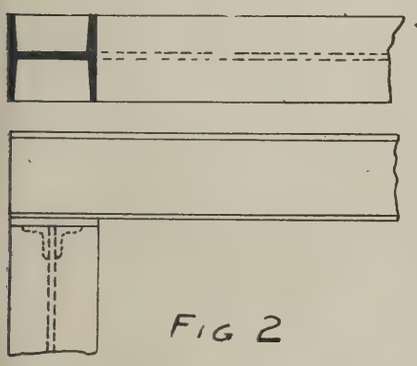
LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
July 11	SCHOOL AT HAZEL GROVE, STOCKPORT (to accommodate 800). Architects desirous of competing should send in their names by this date, with references to school buildings erected under their direction, to J. W. Bate, Clerk, Education Sub-Committee, School Brow, Bredbury, near Stockport. 20 architects to be selected. Remuneration at county scale. Two premiums.
July 13	EXTENSIONS TO WORKHOUSE BUILDINGS, DUDLEY.—Limited to architects practising within 35 miles of Dudley. Conditions from G. W. Coster, Clerk, Union Offices, St. James's Road, Dudley.
July 31	ELEMENTARY SCHOOL AT BANBURY.—Conditions from Oliver Stockton, Town Clerk, Banbury. Deposit £1.
Aug. 1	COUNTRY HOSPITAL, GUERNSEY. Conditions from Thomas Robin, President of Directors of County Hospital, Castel, Guernsey.
Aug. 7	SECONDARY SCHOOL AND TECHNICAL INSTITUTE AT CLECKHEATON (150 places).—Premiums £50, £30, and £20. Particulars from J. Linfield, Clerk, Town Hall, Cleckheaton.
Aug. 31	PARISH CHURCH AT BISHOPWEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Row, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
No date.	SCHOOL AT DEVONPORT. Limited to architects in the Three Towns. Premiums 20 and 10 guineas.



Enquiries Answered.



Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Connecting Joist to Stanchion.

KINGSTON-ON-THAMES. — S.G. writes: "Which is the correct way to bolt a rolled steel joist to a stanchion, and why?"

Figs. 1 and 2 show the two arrangements submitted by the querist. From

the figures the stanchion appears to be a broad-flange beam. In this case there is not much to choose between the two methods. If the load on a stanchion is central, it does not generally matter theoretically which way round it is placed. Fig. 1 is, however, in the writer's opinion, preferable, because, if from any cause the load came to the edge of the stanchion, instead of centrally, this arrangement would be stronger than that shown in Fig. 2. In the case where joists have to be connected to the sides of stanchions, the stanchion is best arranged so that the joist can be connected to its web instead of one of its flanges, as the stress due to the eccentricity of the load is less in this case. A.

The Office of Works.

SHEFFIELD writes: "Where can I obtain a list of questions that were set at a recent examination for appointment as assistant architect and surveyor in the Office of Works?"

Apply to the Secretary of the Civil Service Commission, Burlington House, London, W.

Books on Valuation of Property.

WIMBLEDON.—QUERIST writes: "Please recommend a book giving information as to how the value of property is ascertained; the conditions and items to be considered in order to effect profitable sale and purchase of land; information as to tithes, taxes, ground rent, etc."

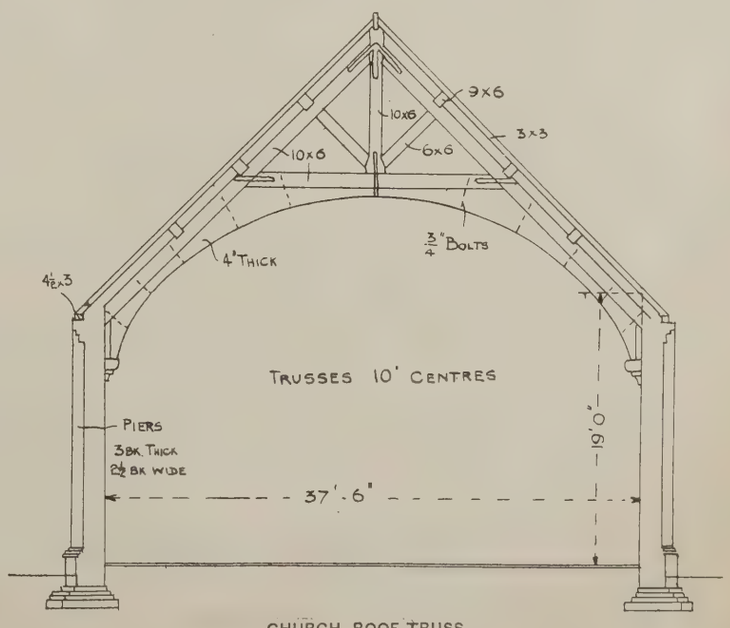
I know of no one book which gives all the information for which you ask, but probably the followng may be of service:—"Valuation of Property," by C. E. Curtis, published at 2s. at "The Field" Office; "Building Estates," by F. Maitland, published at 2s., by Crosby Lockwood and Son (Weale's Series); "House Property," by E. L. Tarbuck, published by Crosby Lockwood and Son (Weale's Series) at 3s. 6d. F.S.I.

Church Roof Truss Stresses.

WINSFORD.—R.S. writes: "Kindly favour with an opinion as to the suitability of the church-roof construction shown in the accompanying illustration."

It is difficult to calculate the stresses in a roof truss of the type shown in the figure, because such stresses depend on the degree to which the walls are able to withstand the thrusts imposed upon them. For this reason, this type of roof is economically and scientifically bad, although for the sake of its appearance it is frequently adopted. In the present case, if, as is probable, it is considered necessary to avoid a tie-beam, the scantlings should be increased. The main rafter and collar-beam should be made 14ins. by 7ins., and the arch-rib increased to a thickness of 6ins. The other scantlings would then be satisfactory. The stability of the buttress, as far as the wind pressure is concerned, can be determined as shown for similar cases in the BUILDERS' JOURNAL for February 19th, 1908 and April 8th, 1908. If this is done in the present case the line of pressure will be found to come outside the section, so that the buttresses should be strengthened. Taking the wind-pressure and dead load as being equivalent to 40lbs. per sq. ft. of ground plan, the total load in this case comes equal to $\frac{40 \times 37{\cdot}5 \times 10}{112}$ =134cwt. on each truss. This means a load of 134=33·5 on each node, so that the horizontal thrust will be equal to $\frac{33{\cdot}5}{2} + 33{\cdot}5 = 50$ cwt. about. The overturning moment at the foot of the wall due to this thrust will be equal to 50 by 19 = 95oft. cwt. Now take the moment of stability of the wall. The weight of wall and pier per truss is equal to $\frac{10 \times 19 \times 3}{2} + 28.5 = 313$ cwt. nearly. The vertical force transmitted from the truss is equal to $\frac{134}{2}$ 67ft. tons, so that the total weight resisting overturning is equal to 313+67=380cwt. The moment of this about the edge of the pier is equal to $\frac{380 \times 13{\cdot}5}{12} = 427$ ft. cwt. This is not so large as the overturning moment, and so the buttresses must be increased. Take buttresses 3 bricks thick by 2½ bricks wide; weight of wall and buttress per truss is then equal 285 80 365; so that total resisting weight=365+67=432 cwt. The moment of this about the edge is about equal to 432 by 3 = 1296 ft. cwt. This will be sufficient to keep the line of pressure within the section, but not enough to fulfil the condition, often imposed, that there must be no tension in the mortar. This size of buttress will, however, be probably quite sufficient, unless the church is in a very exposed position. The truss itself might be strengthened to ensure safety in the event of the walls yielding by adding iron or steel plates as indicated in my reply to "Nouveau" of February 19th, 1908. A.

A Miserere Seat.



M. writes: "The accompanying sketch (not reproduced) shows a miserere seat. Can you tell me from what building it is taken? I am drawing it from a cast for the R.I.B.A. Intermediate."

I cannot say where it is, but I can say where it is not. It is not at Exeter, nor Gloucester, nor Worcester Cathedrals, nor at Salisbury. There are perhaps thousands of old miserere scattered about the country, although only about half-a-dozen in this county, outside Exeter Cathedral, which are at once the oldest and practically the finest complete series in the whole world. HARRY HEMS.

Linen Panelling.

LONDON.—P.H. writes: "Please give section and elevation of a drapery panel."

By the term "drapery panel" we presume you mean the "linen panelling" so often used in Tudor work. Illustrations of such panelling have frequently been published, and we regret we cannot find space to give fresh illustrations now. You will find examples on page 169 and 266 of Ellis's "Modern Practical Joinery" (3rd edition), which can be seen at any good public library. Other illustrations

CHURCH ROOF TRUSS.

are to be found in "The Domestic Architecture of England during the Tudor Period," recently published.

Reinforced Concrete Raft Foundation.

LONDON W.C.—R.D. writes: It is desired to erect a brick building, 24ft. by 24ft. by 12ft. to eaves, on a site that (about twelve years ago) has been raised 20ft., with soft refuse. Piling on piers, carried down to ballast, which is 35ft. below my level, would be too costly. Would a reinforced concrete slab be reliable? If so, what should be the details of construction?"

It is impossible for us, with the information provided by our correspondent, to determine the dimensions and details of a reinforced concrete raft foundation for the building in question. We advise him to place the matter in the hands of a consulting engineer. We certainly consider that a reinforced concrete raft would be satisfactory; whether it would be necessary to have much spread outside the walls depends upon the weight of the building, and the resistance of the subsoil. As regards the position of the reinforcement, that would depend upon the details of the design and the distribution of the loads. It would be more economical to use reinforced concrete than to employ rolled steel joists embedded in concrete.

Stability of King-bolt Truss.

HALIFAX.—QUERUS writes: "Please give an opinion as to the stability of a roof truss constructed as shown in the accompanying diagram." (Reproduced in Fig. 1).

Fig. 1 shows the proposed truss. Taking the load, including the wind pressure, as 40lbs. per sq. ft. of ground plan, we get the load carried by the truss equal to $\frac{23'5 \times 13 \times 40}{112}$ = 108cwt., about. Dividing this load up in proportion to the length of the different portions of the rafters, we get the loads on the various nodes as shown in the frame diagram, Fig. 2, in which the curved tie is replaced by two straight ties, Ao, A'o. From this frame diagram the reciprocal diagram shown in Fig. 3 is obtained according to the ordinary rules. Scaling off from this figure, we get the force P in the tie-bar Ao equal to 120cwt., or 4 tons. The maximum distance x between the straight tie and the curved tie is 1.3ft., or 1.3 × 12ins., so that the bending-moment due to this is equal to Px. The combined stress in the T-bar is equal to $\frac{P}{A}\left(1 \times \frac{xd}{k^2}\right)$, where A is the

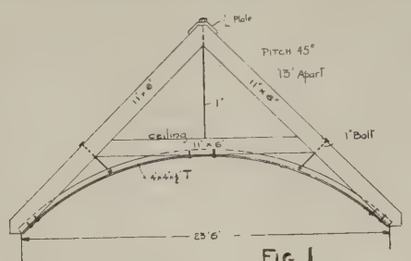


Fig. 1

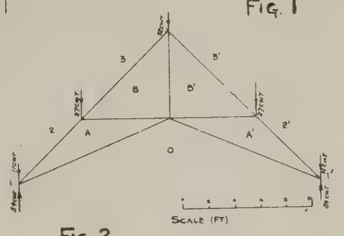

Fig. 2

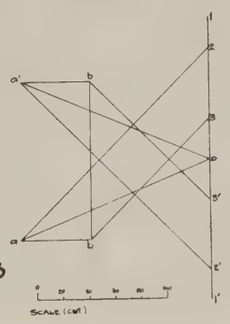

Fig. 3

area of cross-section of the bar, k the radius of gyration, and d the distance from the centroid of the section to the edge. From the tables we see that for a 4 by 4 by ½ T, A=3.75 sq. in.; k^2 = 1.44 inch units; d = 1.16ins. Therefore in our case maximum tensile stress $= \frac{4}{3'75}\left(\frac{1 \times 1.3 \times 12 \times 1.16}{1.44}\right) = \frac{4 \times 13.5}{3'75} = 14'4$ tons per sq. in. This is too much. For a 6 by 4 by ½ T, the maximum stress would come about 11.3 tons per sq. in. This is also high, but the 1in. bolts have a strengthening effect, and the timbers are heavier than necessary to carry their stresses, so that this would probably be safe. To make quite sure of safety by bringing the stresses in the curved tie within 7 tons per sq. in., the T might be replaced by two 5 by 3 by ½ angles, placed with the long legs vertical, and connected to each side of the main rafter and collar beam, bolts passing through the web and the eye-bolts connecting to the rafters being connected to such bolts. The connection between the tie and the rafter should be quite secure. If the tie were increased in strength in this way, the size of the timbers might be reduced if desired, although the additional size adds to the rigidity. A.

Reinforced Concrete and High Temperatures.

BRADFORD.—R.A.W. writes: "How does reinforced concrete stand the high temperatures of flue gases?"

Reinforced chimneys have been found to sustain high temperatures excellently. We would refer our correspondent to the articles by Mr. Sanford E. Thompson, published in our issue for January 29th last, page 107, in which the effect of temperature stresses is referred to at length. In that article reference is made to results of actual experience of nearly 150 chimneys. Concrete chimneys will be smoke-tight and water-tight if adequately reinforced. A plain concrete chimney will not be efficient, and would crack with the expansion and contraction. The problem of designing reinforced concrete chimneys is fraught with some little difficulty, and should only be placed in the hands of those who have made special theoretical and practical study of the subject, though it must be confessed that some of the specialists in this class of work have not proved themselves to be thoroughly competent, as they have had failures that can only be attributed to want of appreciation of the nature of the problem.

Bankruptcies.

During the week ended June 26th, twenty failures in the building and timber trades of England and Wales were gazetted.

J. MORRIS, builder, Richmond. Adj., June 22.

J. POWELL, late builder, Whitstable (formerly of Northampton). Adj., June 23.

C. L. PEPPIATT, builder, London, E.C. Liabilities, £7,964. Estimated surplus in assets, £30.

G. G. ASH, builder, Alvaston. First meeting O.R.'s, Derby, July 8, at 11. P.E., St. Peter's Churchyard, Derby, July 14, at 11

A. DUNN, builder, Gloucester. First meeting O.R.'s, Gloucester, July 4, at 12. P.E., Shire Hall, Gloucester, July 28, at 12.

J. THOMPSON, architect, Kendal. First meeting O.R.'s, Barrow-in-Furness, July 4, at 11.15. P.E., C.C., Kendal, July 15, at 11.

E. BURROWS, builder and contractor, Droitwich. First meeting, O.R.'s, Worcester, July 7, at 12. P.E., Guildhall, Worcester, July 7, at 2.

A. E. PITT, painter and decorator, Earlestown, Lancs. First meeting, O.R.'s, Manchester, July 4, at 11. P.E., C.C., Warrington, August 14, at 11.

Homan's Fire-Resisting Floors

Have been executed in over 3,000 Buildings, and are the most efficient and economical.

Constructional Steelwork of all kinds :—
CAST IRON COLUMNS,
CONCRETE STAIRCASES,
GRANITE WORK,
ASPHALTE,
IRON ROOFS, etc.

Advantages of this Construction :—
All tensional stresses taken by the steel.
All compressional stresses taken by the concrete.
The waved web secures a firm hold on the concrete.
Is cheaper than any other system.

Homan's Patent Steel and Concrete Floor is the latest development of reinforced concrete.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 9. BRADFORD.—Rebuilding of a block of offices in Brook Street and Booth Street, Bradford. Names and addresses of tenderers to be sent not later than July 9, to R. Armistead, 8, Charles Street, Bradford, or W. G. Smithson, 13, Ind Street, Leeds.

July 9. REDRUTH.—Rebuilding of business premises at Fore Street, Redruth. Tenders to be sent to E. F. Grant, Esq., Albany Road, Redruth, on or before July 9. Leonard Winn, architect and surveyor, 27, Boscawen Street, Truro, and The Free Library Chambers, Redruth.

July 9. GASCOIGNE WOOD (Yorks.).—Erection of offices, etc., at Gascoigne Wood. Particulars with Mr. William Bell, architect to the North-Eastern Railway, at York. Quantities supplied on personal application to parties tendering for the whole of the works. Sealed tenders, marked "Offices, Gascoigne Wood," to be sent to the Secretary at York, not later than 9 a.m. on July 9.

July 9. UPPER HOLLOWAY.—Pointing and repairing the brickwork of the tower at the St. Jan's Wood Workhouse, Upper Holloway, in accordance with specifications and conditions of contract, copies of which may be obtained on application to Mr. W. Smith, architect, 15, Mercer's Road, Holloway, N., or 65, Chancery Lane, W.C., upon depositing £1 1s. Tenders to be delivered not later than 3 o'clock in the afternoon of July 9, endorsed "Tender for Pointing, etc.," to Edwin Davey, clerk, Guardians' Offices, St. John's Road, Upper Holloway, N.

July 11-24. NORTHAM (Devon).—New Council school at Northam, Appledore, for Devon County Education Authority. Bills of quantities on payment of £1 1s. Contractors desiring to tender must apply to the County Architect (Education), 3, Richmond Road, Exeter, before July 11, enclosing a crossed cheque drawn in favour of the County Treasurer. Quantities will be issued about July 16, and tenders must be delivered to the Architect not later than 10 a.m. on July 24.

July 11. LAGGAN.—Erection of a Free Church manse at Laggan. Tenders wanted for mason, carpenter and joiner, plumber, slater, plaster and painter work. Plans and specifications to be seen with, and schedules of quantities obtained from, Alexander Cattanach, architect, Kingussie, who will receive offers up to July 11, marked "Manse," Laggan.

ARCHITECT'S Assistant (25), desires engagement; 7 years' experience; working drawings from rough sketches, details, measuring up, surveying, etc.; excellent references; salary 35s.—E. J. C., "Beaconsfield," Kew Green, Surrey. 4368

ARCHITECT'S Assistant, twelve years' experience, desires engagement; good draughtsman, designs, working and detail drawings, etc.; excellent references.—W. A. N., 17, Hugo Road, Tufnell Park, N. 4326

ARCHITECTURAL assistant, served articles, good draughtsman, details; testimonials and drawings if desired: salary 30s. weekly. — Box 4204, Builders' Journal Office.

ARCHITECT'S Assistant (24), desires engagement; over seven years' varied experience; neat and expeditious draughtsman; honours construction and architecture certificates; excellent references; moderate salary.—W. E. K., 34, Wingate Road, Hammersmith. 4417

ARCHITECT'S and surveyor's assistant; seven years' country experience, working drawings, details, specification, surveying, levelling, school work a speciality; entire charge of contracts, 32s.; month's free services.—Box 4408, Builders' Journal Office.

ADVERTISER desires engagement in or near London; expert surveyor and leveller; just completed important survey in the North; plans, specifications, superintendence. — Box 4391, Builders' Journal Office.

ARCHITECT and Surveyor's Assistant (24), passed P.A.S.I. exam.; six years' varied London experience —working drawings, dilapidations, surveying, levelling, measuring and usual office routine; good ref.; salary 30s.—Box 4387, Builders' Journal Office.

ARCHITECT and Surveyor's Assistant (21), 4½ years' London and Provincial experience; Student R.I.B.A.; excellent refs.; experience more an object than salary; country preferred.—E. H. H., 68, Newbridge Hill, Bath. 4386

ARCHITECT and Surveyor's Asst. desires engagement, 15 years' experience; competent draughtsman, colourist, etc.; working and detail drawings, surveying, levelling, and general routine; moderate salary; excellent references.—A. R., 2, Ivy Villas, Cheam, Surrey. 4399

BUILDER'S office, youth (17), just left good school; slight knowledge French, German, and Pitman's shorthand, taking lessons in building construction; anxious to start soon in good office. —Box 4361, Builders' Journal Office.

BUILDER'S Clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4373

BUILDER'S Assistant (23), reliable, desires engagement, construction, surveying, sanitation, measuration, quantities; also accounts, costs, wages, etc.; good draughtsman; assist estimating and supervision; outside experience; moderate salary.—Box 4306, Builders' Journal Office.

BUILDER'S and decorator's general clerk and assistant seeks engagement, whole or part time; accounts, plans, estimates, practical supervision, life experience; undeniable reference. — Address, J. G. P., 40, Roxborough Road, Harrow. 4357

BUILDER'S general assistant, disengaged, 14 years' experience; accounts, prime cost, time sheets, invoices, ledgers, cash and measurements, auction and estate work, and book-keeping; highest references.—Peet, 49, Bushwood Road, Kew. 4389

BUILDER'S Clerk (24), seeks situation; 7 years' London experience. P.C. jobbing wages; schedule work and assist estimates; good refs.—B., 11, Belitha Villas, Barnsbury, N. 4404

BUILDER'S Assistant (24), 8 years in and outdoor experience with large London contractor; quantities, general office routine; assist estimating and supervision.—Box 4401, Builders' Journal Office.

CARPENTER-JOINER (31), seeks situation; good all-round man, good draughtsman, etc. Three years present job, now finishing. Town, country, and teaching experience. Excellent references.—G. K., 8, Tudor Road, Upton Park. 4313

CLERK of Works, contractors' manager, or general foreman disengaged, carpenter and joiner, practical in all details; smart, energetic, trustworthy, recently concluded large industrial undertakings; accustomed to large jobs. — Box 4341, Builders' Journal Office

EXPERT all-round Engineering draughtsman (over 10 years' experience) wishes for occasional work at his own home, or otherwise; lowest terms.—Freeman, 44, Horsell Road, Highbury, N. 4416

FOREMAN Painter, could take entire management of flats or estate. Good estimator. Well up in all trades connected with buildings. Age 35. Life abstainer.—B. Calverley, 20, Fernlea Road, Balham. 4325

FOREMAN painter and decorator (well-experienced) wants re-engagement; not afraid of work. First-class references. Age 37.—Foreman, 16, Gambole Road, Garratt Lane, Tooting. 4431

FOREMAN of painters and decorators, take entire management of flats or estate; town or country; well up in all branches of building trades; total abstainer.—C/o G. N., Sanitary Works, Bridge Road, Chertsey. 4420

GENERAL Foreman, clerk of works, foreman mason, or estate manager, 9 years last situation; experienced in all trades; abstainer.—Allen, 35, Princes Street, Peterboro'. 4334

GENERAL Assistant (30), fourteen years' excellent all round experience, good knowledge of construction, sanitary science, and everything in building estate development; Surveyors' Institution and Municipal and County exams. £4 4s. and prospects of betterment.—Apply Box 4318, Builders' Journal Office.

GOOD shopfitter and case-maker requires constant job; abstainer; refs. if required. Indoor hand. — Box 4388, Builders' Journal Office.

GENERAL Foreman wants job; town or count carpenter; age 44; experienced new or alteratio good timekeeper and manager of men; high references; moderate terms. — King, 4, Bur Grove, Greenwich. 4

IMPROVER or junior assistant (22), stud R.I.B.A., excellent knowledge, practical build construction experience, supervising, neat draug man, surveying; assist quantities; small sal specimens; good references.—Box 4090, Build Journal Office.

IMPROVER or junior assistant (21) desires p tion with architect or surveyor; working drawi quantities, surveys, qualified P.A.S.I.; nom salary.—R. R. F., 25, Queen Street, Hemel He stead.

JUNIOR Draughtsman (19), desires re-enga ment; assist generally; good refs.; town country; shorthand; probationer; R.I.B.A. — Weston, The Laurels, Rotherfield, Tunbridge W

JUNIOR Assistant (20) requires situation in veyor's or builder's office, 3 years' experience London surveyor; can assist in abstracting, w ing up, variations, etc.; willing worker.—W. Co 102, Faraday Road, Wimbledon, S.W.

JOINER-MACHINIST, or general assistant; to office, bench, or building work, planer, spindle, mortise, or entirely bench; construc certificates; good draughtsman; abstainer; re ences.—Box 4419, Builders' Journal Office.

PLUMBER (good registered.) Thoroughly p tical in all branches of first-class sanitary w lead-laying, gas and hot water fitting; alterations, or jobbing. Reference.—Plumber, Sunnyside Road, Upper Teddington.

PLUMBER, gas and hot water fitter, desires ployment; good refs.; total abstainer; moderate.—P. A. J., "The Lodge," Bonner Road, Kingston.

PLUMBER wants job in town or country; stancy preferred.—E. Frogley, 2, Mount St Dorking, Surrey.

QUANTITY Surveyor's assistant, just compl three years' articles, passed Intermediate of veyors' Institution; first class references, billet in busy office; salary £7 per mensem.— 4346, Builders' Journal Office.

SURVEYOR'S Junior Assistant (19), Student served articles; good leveller, draughtsman tracer; experienced in private street works, ing, sewerage, water supply, etc.; excellent monials; small salary. — Box, 4284, Buil Journal Office.

SURVEYOR, architect's junior assistant fami iar estate work, surveying, levelling, ge building work; small specifications, and quant 4 exams. Inter. R.I.B.A., June next, 1½ guin Box 4288, Builders' Journal Office.

THOROUGHLY competent builder's book-k and general assistant requires engagemen years' experience in London with builders shopfitters; good reasons for leaving present excellent references. Age 32.—Apply Box Journal Builders' Office.

TEMPORARY assistance on working dra quantities, measuring up, surveys, levels, s out and stee.work generally rendered at o outside offices—F. B., 51, Hillfield Park, M Hill.

THE ESTATES MANAGER AND AGENT t known public institutions. London estates prising over 1,000 properties), holding a ment, over 11 years, desires similar appoi in town or provinces, with view to improvi position; exclusive knowledge and experie management of leasehold and troublesome properties; thoroughly qualified architect a veyor; administrative ability and experience collecting; highest references. — Apply Bo Builders' Journal Office.

TO ARCHITECTS.—An experienced Civil En will advise upon and assist on drainage di water supply and estate development; road veys, levels, etc.—Apply Box 4121, Builders nal Office.

TO Contractors and Builders.—Smart, energe experienced general foreman desires re-e ment (carpenter and joiner by trade). Fir refs.; moderate salary for good job.—Pleas "London," Box 4392, Builders' Journal

WANTED at once, position as builder's m assistant, or general foreman; disengaged energetic; abstainer; references. — Box 4 Broadway, Wimbledon.

YOUNG architect, having completed engag with well-known city surveyor, is at liberty sist architects with the preparation of t signs; 7 years experience. Student R.A. Sch R.I.B.A.—Box 4294, Builders' Journal Office

July 15, 1908. Volume 28, No. 701.

Foolhardy Risks.

Accidents that workmen bring upon themselves by sheer foolhardiness are so common as to be regarded as incidental to the business. It will be remembered that in the draft regulations prepared by the Home Office Committee on Building Accidents an abuse of cranes and hoists was recognised and expressly forbidden, regulation 44 insisting that workmen "shall not be carried by the cranes, or ride in barrow hoists or hod hoists, or adopt other unsafe means of getting about the building, but shall use the gangways, ladders, or stairwises provided for the purpose." In reproducing this regulation, in our issue of January 8th last, we appended a comment on the rashness with which workmen commonly disregard the obviously necessary and common-sense precaution embodied in the clause. A painful instance of this recklessness is reported from Truro, where, on Wednesday last, five workmen employed on the erection of the western towers of the cathedral were seriously injured. They were working at a height of about 70ft. Just before the dinner-hour a lift or cage for conveying materials was sent up, and after it had been unloaded a party of six men stepped into it in order to get to the ground. Something having gone wrong with the gear, the cage ran down at a furious pace and four of the workmen were injured, two very seriously. These poor fellows having paid a heavy penalty for their carelessness, further comment on their particular case would be impertinent. It is to be supposed that, unless closely watched, men will continue to add to their risks by using unsuitable and unauthorised means of conveyance. To save themselves time and trouble is not the only incentive; and, so far from being ignorant of the danger, they realise it quite widely, and court it in a spirit of bravado; the more cautious or timid of the men or youths being ashamed to betray what the others would regard as effeminate weakness. Regulations which are merely prohibitive without penalty may possibly be useful in defending an action for damages, but they will never prevent accident unless they are rigidly and sternly enforced with instant dismissal as the penalty for infraction. But to save foolish workmen from incurring unnecessary risks is well-nigh impossible. They evidently hold that regulations, minds, and limbs were all made to be broken.

Modern Building Methods and Unemployment.

The causes of unemployment in the building trade are examined and discussed at considerable length in the "Morning Post" for July 8th by a writer whose somewhat discouraging conclusions seem to be only too well warranted by the facts that he summarises. He deals specially with London, where he thinks there have never been so many large and important buildings rising at one time as at the present; and yet he is forced to admit that, with all its apparent prosperity, the building trade is more "slack"—he means, of course, as regards the workmen—than it has ever been before. This paradoxical statement he proceeds to justify by explaining the great alteration that has taken place within recent years in the conditions of production. He instances particularly the general use of labour-saving devices. Less than thirty years ago, woodworking machinery was uncommon, except in the largest shops; now it is found everywhere, and one spindle, operated by one man, will do in one day as much "sticking" as a bench joiner could do in a month. The carpenter is being rapidly eliminated. Formerly he "would lay joists and floorboards, make partitions, fix windows and doors, and, of course, prepare the timber for the roof. Now, the joists and the roof supports are generally steel and the floors concrete, while the partitions are usually constructed of one or another of the plaster slab compositions, so that all that is left to the carpenter is the fixing of windows and doors." The plasterer also suffers from the increasing use of slab partitions, which require only a single coat of plaster facing, whereas the old-fashioned lathing required three coats. The London mason, too, finds fewer opportunities of employment, the stonework being now usually worked at or near the quarries instead of on the job or in a yard near it. The custom, once general among the more prosperous of London builders, of keeping a permanent staff of good mechanics, is now almost entirely abandoned; "almost without exception, the London builders, at the finish of a contract, discharge everybody; and those men who were formerly in regular employment find it difficult to obtain a job which shall last for more than a month." The strange case of the plumber is set forth with refreshing candour. "Jobbing work (patching up and tinkering) formed for many years the stand-by of the plumber, but of late years the standard of excellence enforced by the public authorities has been so high that this tinkering has been stopped." Finally, the painters also are being sacrificed to modern methods. The common use of electric light instead of gaslight "makes a tremendous difference in the cleanliness of inside London"; ceilings and walls require the attention of the painter far less frequently and much less extensively than in the time of universal gas lighting; while the enormous areas of interior wall-surface that are now lined with glazed bricks must deprive the painter of about a third of his old-time opportunities. The "depression," it will be seen, is not merely temporary: "The trade has changed its ways, and there is not the slightest prospect of any return to the old style." This is a hard saying for the unemployed; but it is best to face the facts.

Architectural Education at University College.

Some important alterations have been made in the architectural day courses at University College since the incorporation of the College into the University of London. After this session the existing two years' day course will be discontinued. The courses in future will both be for three years; one course leading to the B.A. degree of the University, the other to the College certificate. The architectural training in the two courses will be the same; but candidates for the degree will have to pass the Matriculation examination of the University before commencing the course, and the intermediate examination in general subjects at the end of their first year. Certificate students will not have to pass any preliminary or intermediate examination, but in their first year they will be required to attend lectures on general subjects, each student having the right to choose his own from a long and comprehensive list, including languages, mathematics, mechanics, physics, chemistry, geology, etc. The study of such subjects is discontinued after the first year in both courses, and the second and third years are devoted entirely to architectural work. The reasons for instituting the Degree course and for making the change in the Certificate course are: (1) the amount of general knowledge possessed by the majority of boys on leaving school is not sufficient to enable them to follow a comprehensive architectural training, which must in these days include at least the simpler problems of engineering (besides

MEMORIAL TO THE LATE DR. BARNARDO AT BARKINGSIDE, ESSEX. GEORGE FRAMPTON, R.A., SCULPTOR.

This memorial was recently unveiled by the Duchess of Albany. The pedestal is of fine grey granite, about 100 tons of specially selected blocks having be required for it. The stones forming the seating right and left are shaped out of the solid blocks. This work was executed by Messrs. Kirkpatrick Brothers, the Manchester Granite Works, Trafford Park, and was in hand some four months; the date of completion being well within the guaranteed time. The princip group on the memorial, representing Charity clasping two children to her breast; the bas-relief of Dr. Barnardo; and the group of three little girls, were executed bronze, to Mr. Frampton's design, by Mr. A. E. Burton, of Thames Ditton.

which the student who cannot read books published in foreign languages is at a serious disadvantage); (2) most schoolboys have not learnt how to learn, and nothing helps them to do this better than a course of study at a University. At the same time it is recognised that some architectural students, and those not necessarily the least promising, are unable to reach proficiency in certain subjects—mathematics in some cases, languages, etc., in others—and the certificate course is therefore framed accordingly. The granting of the certificate is not in any way dependent on the passing of examinations in general subjects. The required standard in these for degree students—that of the intermediate examination—is not unnecessarily high, and yet is admitted to be sufficient for all practical purposes. (3) The first-year training in both courses includes instruction in building construction and in architectural and freehand drawing, and students consequently commence their professional training from the first, this running concurrently for one year with the study of other subjects. (4) Degree students who, having passed the preliminary examination, fail in their intermediate, can, if they please, proceed with the certificate course without loss of time. (The Professor of Architecture at University College is Mr. F. M. Simpson.)

CARDIFF OLD TOWN HALL has been purchased for £60,000 by the Wholesale Co-operative Society, who intend to dismantle the old building and erect what will be one of their largest depots.

CHANGE OF ADDRESS.—Messrs. C. Pearson, Shaw, Son and Hemingway, quantity surveyors, arbitrators and valuers, have removed from Pelham Chambers, Angel Row, Nottingham, to 14, Sherwood Street South, Nottingham.

THE SCULPTOR'S ART IN ENGLAND.

Although not usually repulsive in treatment, and indeed, as a rule, modelled with a considerable amount of scholastic accuracy, the statues which have been set up in London and elsewhere in this country during the past hundred years are often lacking in the originality of conception and vigour of execution requisite for the attainment of a high standard of artistic success. The Wellington monument in St. Paul's Cathedral, perhaps the one brilliant exception to the usual mediocre production of modern English sculptors, was the work of an artist whose talents were neither appreciated nor understood by the public during his lifetime, and who died neglected, worn-out by the constant vexatious interference of the Government, without seeing the realization of the grand design which he regarded as his life's work. It is idle to speculate whether, in happier circumstances, the genius of Alfred Stevens would have been as instrumental in founding a school of sculpture in England as was that of Raphael in instituting one of painting in Italy, but there can be little doubt that the non-existence in our own country of some system of artistic education under which the impress of the genius of one man can be handed down to future generations accounts, to a large extent, for the present unsatisfactory condition of national art.

The Beginnings.

A glance at the historical development of sculpture in this country is sufficient to show that for hundreds of years there has been no native school of plastic art, and consequently there is neither national style nor national tradition to bequeath to posterity. The earliest specimens of stone sculpture are found among the memorial crosses of certain churchyar situated chiefly in Cornwall and in northern parts of the Kingdom. Althou generally graceful in outline, and, ow in a large measure to the ingenuity played in the arrangement of the des of the constantly recurring interla knotwork, rich in decorative effect, t undoubtedly exhibit a very primitive s of artistic development. Of far grea interest, from the sculptor's point of vi are the two stone 11th century reli Byzantine in treatment, now in Chic ter Cathedral, in which scenes illust ing the raising of Lazarus are depicte stiff, ugly and extremely attenu figures. During the earlier Nor period the tympana of church doorv were often adorned with rude sculpt enrichments, and in the later deve ment of this style, although the sc ture is often rich in design and spi in execution, the treatment of the hu figure is still weak and devoid of gr

Mediæval Work.

The best preserved examples of century monumental sculpture are effigies of the Knights-Templars in Temple Church, London, which are c hard Purbeck marble; but another ef in the same church, carved in stone at one time decorated with colour, is finer piece of sculpture, and shows a artistic advance on the usual work o period.

In the second half of the 13th anc beginning of the 14th century the a sculpture had made rapid progres England, owing to the patronag Henry III., who employed a large nu of native artists and imported fo ones from Italy and Spain. In fact end of the 13th century saw the cu ating point of English sculpture, being the only period in its histo which a high degree of excellence

obtained by purely national means, for the foreign artists brought over by the king were merely employed, under the supervision of their English colleagues, in quite a subordinate capacity. The two bronze effigies in Westminster Abbey modelled and cast by William Torell (a goldsmith and citizen of London), about the year 1300, which are on the tombs of Henry III. and Queen Eleanor, bear no traces of foreign influence. The crowned head of the king with its clearly defined features is extremely well modelled, whilst the head of Eleanor is remarkable for its almost classic beauty, and in both cases the drapery is well designed and executed.

Salisbury, Peterborough, and Lichfield Cathedrals all have fine examples of 13th century sculpture, and Westminster Abbey possesses a representative collection, which is almost complete, of English mediæval sculpture, from the 13th to the 16th century. Carving in stone, of a purely decorative character, reached its highest point of excellence rather later than the best period of figure sculpture—namely, about the middle of the 14th century.

Bronze Sculpture.

The gilt-bronze effigies of Edward III. and of Richard II. and his Queen, to be seen at Westminster Abbey, are inferior, as works of art, to the earlier figure work of William Torell. The effigy of Richard I. was executed by Nicholas Broker, and that of Anne of Bohemia by Godfred Prest, both citizens of London.

Another example of the sculpture of this period is the bronze effigy of the Black Prince (d. 1376) at Canterbury, but a better and more realistic work is the figure of William of Wykeham (d. 1404) in Winchester Cathedral. Examples of 14th century sculpture exist in profusion in the cathedrals of Lincoln, Exeter, York, Rochester, and Lichfield.

In the Beauchamp Chapel at Warwick there is a fine 15th century bronze effigy of Richard Beauchamp (d. 1439) which is richly decorated with engraved ornamentation. The modelling and casting of this figure were done by William Austen, of London, and the gilding and engraving by a Netherlands goldsmith named Bartholomew Lambespring.

At the commencement of the 16th century English sculpture began to lose its native individuality, and entered upon a period of rapid decadence. The life-size figures placed high on the walls of Henry VII.'s chapel at Westminster vary in merit. Some are merely copies of older English sculpture, and other show traces of German and Italian influence; in some cases the heads and general pose are graceful and dignified, but, in the main, they fall below the better plastic art of the 13th and 14th centuries.

The Decline.

This decline of English sculpture appears to have been recognised by Henry VII., and led to his invitation to Michael Angelo's old enemy, the sculptor Torrigiano (1472-1522), to visit England to model and cast the bronze recumbent figures which the king was about to have executed for his magnificent tomb in the chapel at Westminster. Another work of this Florentine sculptor is the bronze effigy of Margaret of Richmond placed in the south aisle of the same chapel.

The decline of sculpture continued during the troublous times of the Reformation, and during the 17th century the effigies enshrined in the costly monumental tombs of alabaster and marble, which were then in such demand, were usually feeble in conception and badly modelled.

Nicholas Stone (d. 1647), who worked with Inigo Jones, was the chief English sculptor of his time, and to him are attributed the De Vere monument in the north transept of Westminster Abbey and the bronze statues of George Villiers, Duke of Buckingham, and his wife, in Henry VII.'s chapel.

The bronze equestrian statue of Charles I. at Charing Cross (taken from its pedestal and concealed during the Protectorate and replaced at the Restoration) is the work of the French sculptor, Le Soeur (d. 1670), whilst the statue of James II. at Whitehall is attributed to Grinling Gibbons, a native of Holland, who was more famous for his skill as a wood carver than as a sculptor.

Sculpture in the 18th and 19th Centuries.

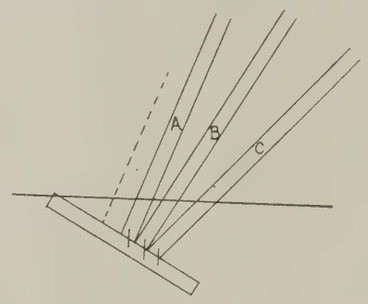
During the 18th century sculpture in England was to a large extent controlled by foreign artists, of whom Roubiliac (1695-1762), Rysbrack (1694-1770), and Scheemakers (1691-1773) were perhaps the best known. Later, Nollekins (1737-1823), a pupil of the last named, shared with John Bacon (1740-1799) and John Flaxman (1755-1826) the honour of being regarded as the leading sculptor of the day.

Flaxman, to whom the classical revival in sculpture was largely due, worked for many years for Josiah Wedgwood, the pottery manufacturer, for whom he designed a number of very refined cameo-reliefs for the adornment of vases. Flaxman's more ambitious works are of less merit, but all breathe the essense of classic art and scholarship.

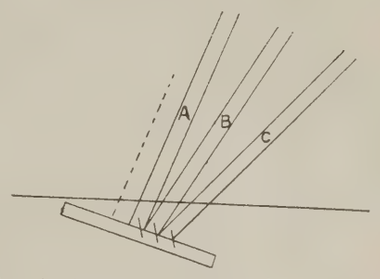
The first half of the 19th century saw the prevalence of the cold, lifeless, pseudo-classic style of which Francis Chantry was perhaps the one exponent of genius. To him succeeded John Gibson (1790-1866), who unsuccessfully endeavoured to revive the polychromatic decoration of sculpture, the *circumlitio* of the classical age of Greek art. Others sculptors of this period were E. H. Baily (a pupil of Flaxman), who executed the bas-reliefs on the south side of the Marble Arch, Westmacott (the author of the Achilles statute in Hyde Park), Wyatt (who cast the equestrian statue of the Duke of Wellington), Macdowell, Campbell, and Banks.

The ridiculous custom, at one time so prevalent, of representing Englishmen of the 18th and 19th centuries clad in the *toga* or armour of Ancient Rome has invariably proved fatal to the realisation of a satisfactory artistic effect.

Once only, during the phase of art favoured in the golden days of the 13th century, did the English sculptor appear to inherit one of the great merits of the best Greek masters. In the period to which we refer the figures and reliefs of the mediæval sculptors formed an integral part of the architectural design to which they were affixed, and were almost invariably designed with due regard to the main lines of the buildings they were intended to decorate, to the architecture of which they were, rightly, held to be subordinate. But modern sculptors (or modern architects?) for many years past have cared for none of these things.



WESTMINSTER STREET REPAIRS now in hand include many of the chief thoroughfares in the district, such as Grosvenor Road and Northumberland Avenue.

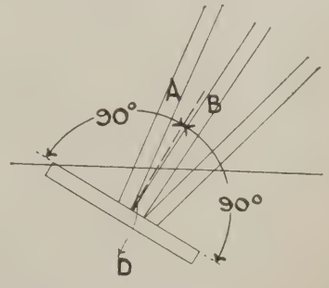


Correspondence.

Shoring.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to the article in your issue of June 24th on the subject of shoring, would your contributor be kind enough to say why the sole-piece is placed at or beyond right angles to the raking shores, and how it is proposed to tighten them up? I reproduce a portion of Figs. 4 and 5, excluding the riders. Now, B must be fixed before A or C. Also the needles must be fixed before the shores.



How is A to be tightened, seeing that the nearer it is prized towards B the looser it will become? It is not proper to wedge at the needles or between the rakers and the sole-piece. I should also be glad to know what objection there is to the usual method of placing the sole-piece at a slight angle to the rakers, as shown in my second sketch, so that the act of bringing the rakers up into their place automatically tightens them.

BUILDING SURVEYOR.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The following will clear up "Building Surveyor's" difficulty:—

Referring to Figs. 4 and 5 of the illustrations on p. 525 of your issue for June 24th, these shores were taken from an actual erection. The outer shores had

wedges fixed at their upper ends for tightening up. The shores A and B of querist's sketch thrust one against the other, and, in the case in point, it was not necessary to tighten up. If such had been necessary, thick wedges inserted at D would have been sufficient. This is an alternative method to Fig. 3 on p. 525, for, as shown at D, the shore feet thrust one against the other, and wedges

inserted force out the feet right and left along the sole-plate, thereby tightening up the shores. H. SLICER.

Banbury School Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—An advertisement of the above has appeared in several of your recent issues, and I should be obliged if, as a matter of some interest to your readers, you could find space for the following.

The notice referred to is of the usual type and gives no hint of the procedure adopted by the Banbury Education Committee. It invites architects to submit designs, the conditions for which are to be obtained from the clerk in exchange for a deposit of £1.

It is no way my intention to criticise the conditions, for, although one may consider that to require "quantities" without offering any additional remuneration is asking too much, the justness or not of such a demand is largely a matter of opinion. It is not, however, the usual custom to retain the deposit money when the authorized copy of the conditions is returned immediately, but the Banbury Committee has done so.

This proceeding may be eminently profitable to the committee, but, if it becomes general, the consequences will be disastrous, as it gives the opportunity to any council to issue the most unfair conditions, and, by enforcing this regulation, to acquire a considerable sum which should not be theirs.

Other objections, such as the discredit which it will bring upon the competition system, need hardly be mentioned.

WILFRID I. TRAVERS, A.R.I.B.A.

Our Plate.

Porte Cochere, Rue de Lille, Paris.

This is an interesting example of architectural design of the period of the First Empire. It is eminently characteristic of the French school, showing great delicacy of proportion and appropriateness of detail, and as such it merits the attention of modern architects.

COMPETITION FOR NEW COUNTY HALL & OFFICES, CARDIFF.

Summary of Conditions.

The following is a summary of the conditions of the competition which is being promoted by the Glamorgan County Council in connection with the new county hall and offices proposed to be built in Cathays Park, Cardiff:—

Premiums of 100, 50 and 30 guineas for designs placed first, second, and third respectively.

Designs to be submitted by October 1st, 1908.

Accommodation specified in detail; site plan supplied; no rights of light.

Drawings to be to the scale of 8 ft. to 1 in., comprising plans of each floor, at least two elevations and sections, and ½ in. detail of main front; also a key plan to each floor showing the accommodation provided for each department.

Drawings to be accompanied by report, with particulars of materials proposed to be used, and stating price per cub. ft. of each section, as well as an estimate for the whole.

Total cost not to exceed £45,000 above basement floor, including water supply, heating, lighting, and ventilating.

The designs will be adjudicated upon by an independent architect specially engaged for this purpose. His instructions will direct him to have special regard to convenient planning and arrangement, and he will be expected to give his opinion that the designs to which he awards premiums can be carried out for the amount herein named for the architects to work to, and accord with these requirements.

The County Council do not bind themselves to adopt the design placed first, or to employ its author or the author of any other of the competitive designs to carry out the building. If they do so, any premium awarded will merge in the commission which will be paid him as herein provided. If none of the competitive designs are adopted, the liability of the Council will cease on the payment of the above premiums as awarded, and the return of their designs to the competitors.

The attention of competitors is called to the Standing Order of the Council that personal canvassing for any appointment is prohibited, and will disqualify.

When the Council has accepted a design for execution, quantities will be taken out by a quantity surveyor approved by the architect engaged, for a commission of 1 per cent. on the estimated cost of the building, which, together with the cost of multiplying the bill of quantities, will be paid by the County Council.

A commission of 5 per cent. upon the cost of the buildings will be paid to the architect engaged for his services, including settling the final account, such commission to include all office expenses, stationery, and all other charges in connection with the work, except architect's travelling expenses, and his fees when giving evidence on any litigation or arbitration.

A clerk of the works will be engaged and paid by the County Council to superintend the works, under the direction of the architect.

Notes on Competitions.

Secondary School. Shrewsbury.

The design of Mr. Joseph Holt, A.R.I.B.A., of 9, Albert Square, Manchester, has been placed first in the competition for this school.

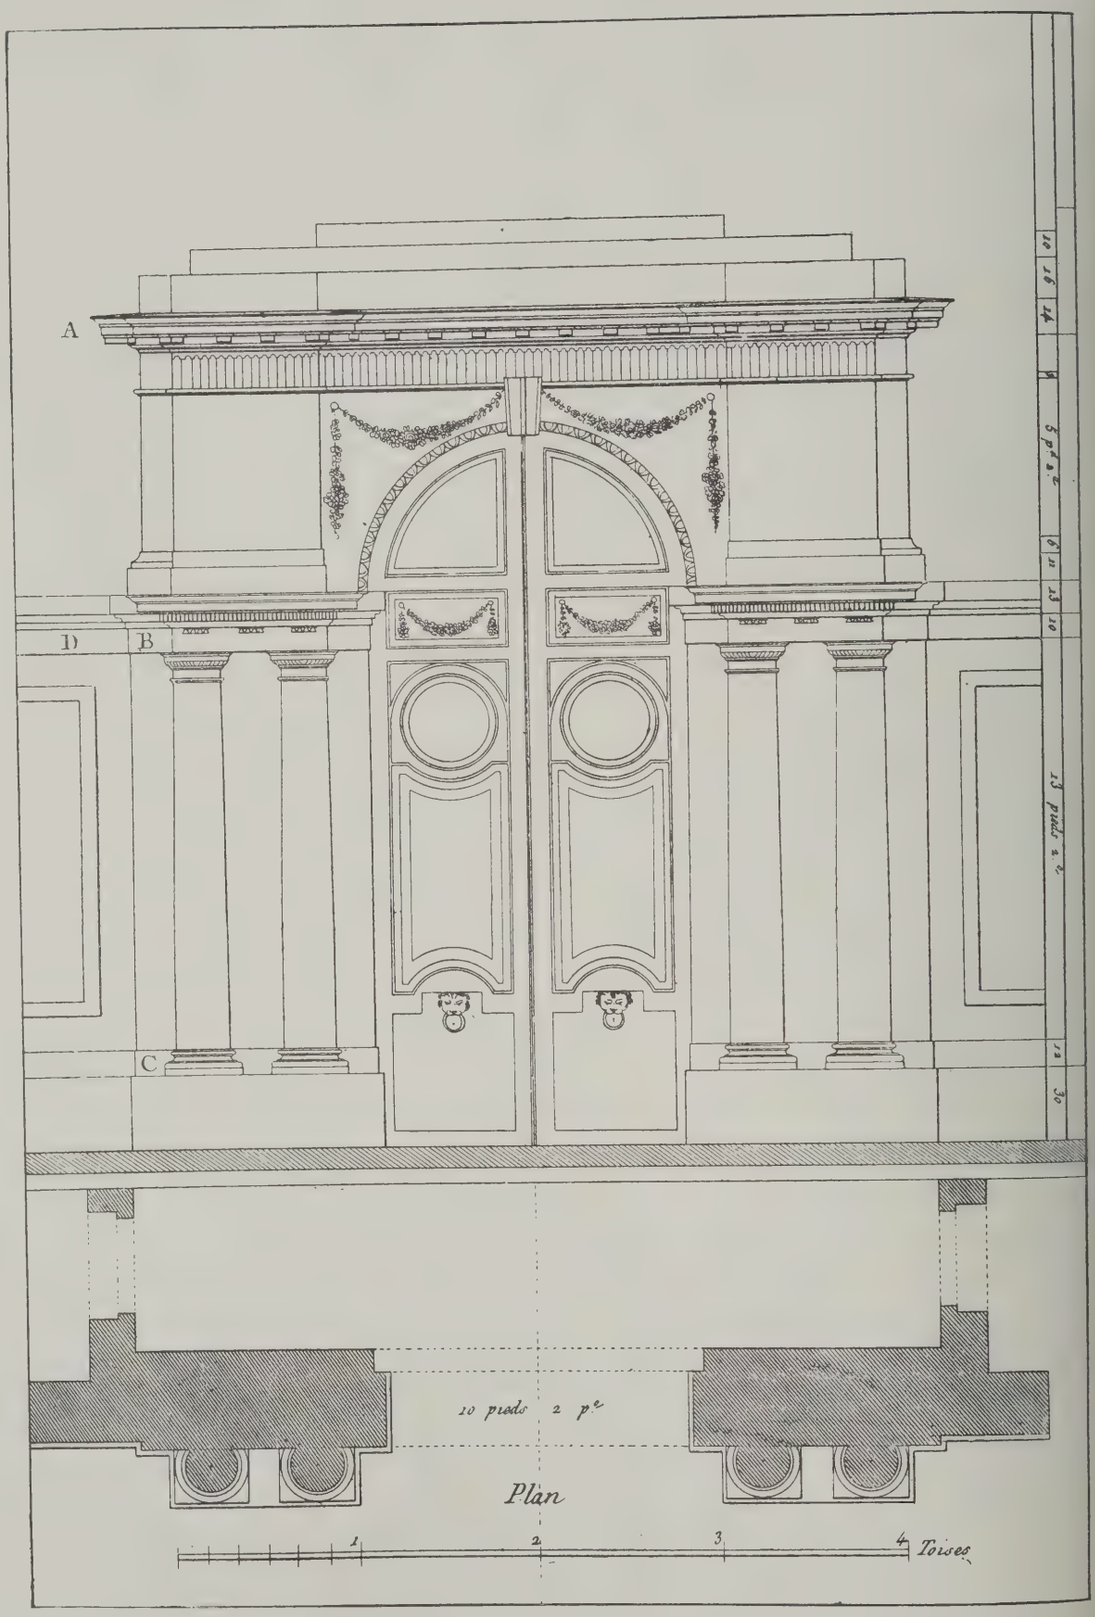
Public Hall and Institute, Andsell.

In a limited competition among architects in Manchester, Blackburn, Lytham, and St. Anne's for a new public hall and institute to be erected at Andsell, near Lytham, the design of Mr. G. H. Willoughby, F.R.I.B.A., of Parr's Bank Chambers, Manchester, has been selected by the committee. The work is to be proceeded with at once in order that the foundation-stone may be laid early in the autumn.

Public Libraries, Rowley Regis.

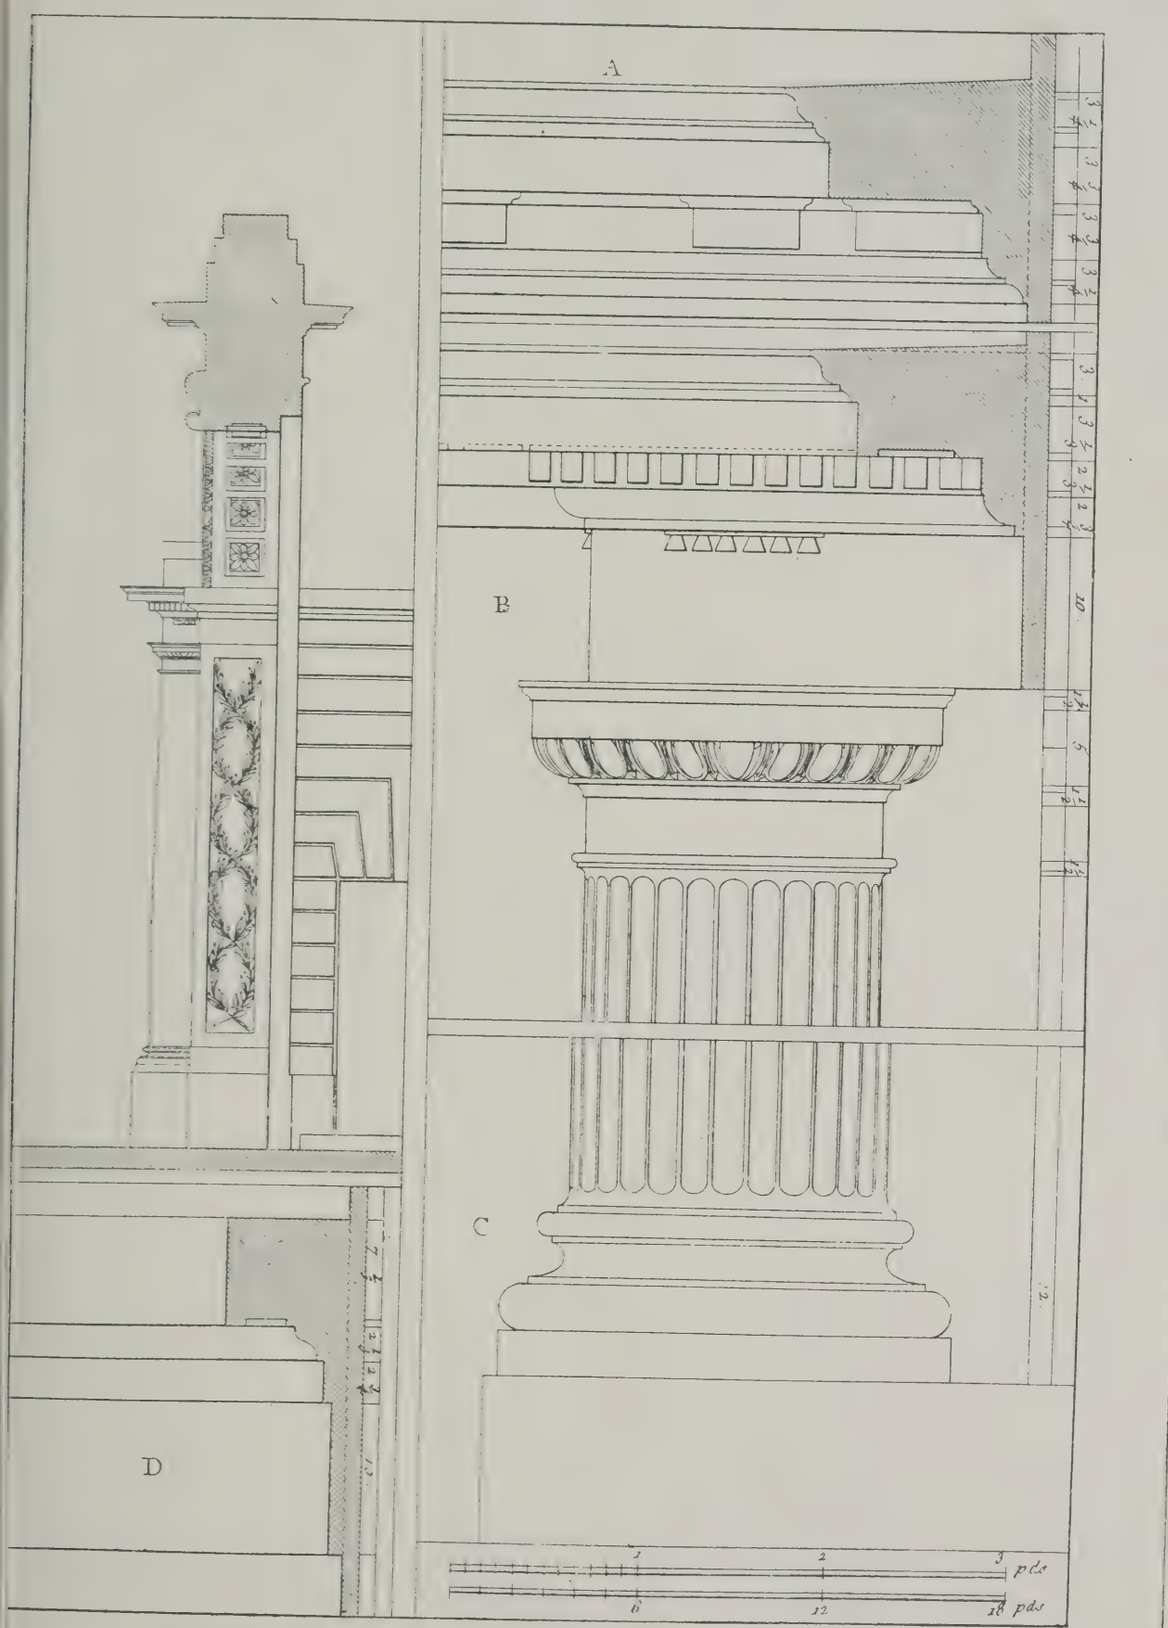
In this competition 103 designs by 99 competitors have been submitted. The design placed first by the assessor is that by Messrs. Wills and Anderson, of London, and that placed second by Messrs. Crouch, Butler and Savage, of Birmingham, while the designs submitted by the following architects are specially commended: Mr. A. T. Butler, Cradley Heath: Messrs. Hardy and Harris, Westminster; Mr. G. H. Wenyon, Dudley; Messrs. Hall and Phillips, London; Messrs. Hobbiss and Thacker, Birmingham; and Messrs. Adams and Holden, London.

LIST OF COMPETITIONS OPEN.



Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
July 31	ELEMENTARY SCHOOL AT BANBURY.—Conditions from Oliver J. Stockton, Town Clerk, Banbury. Deposit £1
Aug. 1	COUNTRY HOSPITAL, GUERNSEY.—Conditions from Thomas Robin, President of Directors of Country Hospital, Castel, Guernsey.
Aug. 7	SECONDARY SCHOOL AND TECHNICAL INSTITUTE AT CLECKHEATON (150 places).—Premiums £50, £30, and £20. Particulars from J. H. Linfield, Clerk, Town Hall, Cleckheaton.
Aug. 31	PARISH CHURCH AT BISHOPSWEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Road, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Oct. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
No date.	SCHOOL AT DEVONPORT. Limited to architects in the Three Towns. Premiums 20 and 10 guineas.
No date.	SITE-PLAN FOR COTTAGE EXHIBITION, SWANSEA, 1909. Gold, silver, and bronze medals, together with sums of £20, £15, and £10. Particulars from Henry R. Aldridge, Secretary to Exhibition, 7, Gower Street, Swansea.



Law Cases.

HOME OFFICE REGULATIONS FOR PREVENTING ACCIDENTS TO WORKMEN.—In the Southwark Coroners' Court on July 4th Dr. Waldo held an inquest on William Thomas McShee, aged 61, a foreman painter employed by Messrs. John Greenwood and Co., Ltd., of Arthur Street West, London, E.C. It appeared that McShee on the previous Saturday was engaged in decorating the Leather Market, Bermondsey, and that to reach the roof of an office 10ft. from the ground he ascended a pair of steps only 9ft. high, another man steadying them until he reached the top. A little later a crash was heard, and McShee was found to have fallen to the stone floor, the steps being beside him. He died in Guy's Hospital from the effects of his injuries. Mr. A. G. H. Thatcher, one of His Majesty's inspectors, stated in evidence that at present there was nothing in the Factory Acts requiring a second man to hold steps. The Home Office, he said, was considering the desirability of adopting a series of regulations which, it was hoped, would have the effect of preventing a large number of the accidents that now happen to workmen. One suggestion was that where ladders were used for giving access to work they should rise to a reasonable height (6ft. was suggested) above the place of access. Had such a regulation been in force on this occasion it might have prevented the accident.—In returning a verdict of "Accidental death," the jury expressed a hope that the Home Office proposals would take effect.

ARCHITECT'S CLAIM FOR FEES.—At the London Law Courts, on July 9th, the Official Referee, Mr. Muir MacKenzie, heard the case of *Barnes and Buxton* v. *Sievewright*, which was an action brought by a firm of architects, of West Hartlepool, against Mr. William Sievewright, a shipbroker, of Manchester, and Mr. Frederick Sievewright, a commission agent, and a director of companies at West Hartlepool, for £2,340, for services rendered by Mr. Harry Barnes, jun., a member of the plaintiff firm.—Plaintiffs' counsel stated that in 1901 defendants conceived the idea of starting cement works at Haverton Hill, and Mr. Harry Barnes was asked for information as to the cost of erecting a building to contain the machinery necessary to manufacture cement, and he wrote a letter stating that he would be willing to prepare the preliminary plans and estimates of the cost of the works for a nominal sum of £20, on condition that he should be employed as the architect, and paid a certain commission on the cost of the work. Defendants did not succeed in getting the Haverton Hill site, and then it was proposed to go to Manchester. Mr. Barnes visited that site, and that idea fell through. Then it was proposed to go elsewhere, and Mr. Barnes executed the work which he said represented the amount of the claim. Defendants' case was that Mr. Barnes's letter precluded plaintiffs from recovering more than £20, except that Mr. Barnes was entitled to be paid in addition for certain things he did at the end of the period. The case was ultimately settled on the following terms: That the defendants pay the plaintiffs £1,000 within seven days, and the taxed costs of the action, and if the defendants did not proceed with the building within 12 months, the defendants were to pay the plaintiff £750 in addition.

NORWICH BUILDING TRADE CONCILIATION BOARD.

The second annual meeting of this Board was held recently, and in consequence of the death of the chairman (Mr. J. Hurn), Mr. G. F. Hipperson took the chair. After confirming the minutes of the last meeting of the Board, it was reported that the representatives for the forthcoming year were:—*Employers*: Messrs. G. A. Mawes and J. Youngs (masons); Messrs. H. E. Scarles and J. S. Smith (bricklayers); Messrs. T. W. Scarles and W. Stacey Daws (carpenters); and Messrs. W. E. Bird and R. A. Pank (plumbers). *Operatives*: Messrs. G. Brown and G. F. Hipperson (Bricklayers' Society); Messrs. J. Green and F. Buttress (Masons' Society); Messrs. J. Newman and G. E. Beckwith (Carpenters' Society), and Messrs. C. Lake and A. Pigg (Plumbers' Society). On the motion of Mr. W. Stacey Daws, Mr. G. Brown was appointed chairman for the forthcoming year. The two secretaries, Mr. J. H. Catch (employers) and Mr. G. E. Beckwith (operatives) were re-elected.

During the year which the Board has been established it has done some useful work. Points which had been in dispute in regard to the carpenters' and bricklayers' rules have been amicably settled by the Board. One or two outstanding matters affecting the masons were dealt with at the meeting and adjusted to the satisfaction of both masters and men. Some points concerning the rules of local plumbers may have to be considered in the near future, but no difficulties are anticipated. Codes of working rules affecting the local building trades have now been signed by representatives on both sides, and will remain in force until 1911.

Obituary.

THE LATE MR. WILLIAM BOUCH, builder of the Tay Bridge, who died on April 30th last, aged 49, left estate which has been proved at £282,225.

MR. ALFRED DARBYSHIRE, F.S.A., F.R.I.B.A., died on July 5th at his residence, Chatham House, Flixton, in his seventieth year. Mr. Darbyshire came of an old Quaker family. He was born in the Adelphi, Salford, in June, 1839. He was educated in Manchester, at the Friends' School at Ackworth, and at Alderley, and, after serving his articles in the office of Peter B. Alley, he began at the age of 23 to practise for himself. His reputation is chiefly that of a theatrical architect. In Manchester he built the Comedy Theatre and the Palace of Varieties; he carried out extensive alterations at the Theatre Royal, and also at the Prince's, which was originally built for Mr. Edward Salomons. He also designed a theatre at Rawtenstall and one at Exeter. In London Sir Henry Irving employed him to alter and to decorate the Lyceum. He built the Manchester city abattoirs in Water Street and the lodges to Alexandra Park. Pendleton Town Hall is also his work. He refitted and decorated Hutsford Parish Church and restored Adsall Hall. Galtee Castle, County Cork, and St. Cyprian's Church, Salford, are his, or the work of his firm, Messrs. Darbyshire and Smith, who were also responsible for the representation of "Old Manchester and Salford" at the Jubilee Exhibition of 1887. Mr. Darbyshire was a Fellow of the Royal Institute of British Architects and of the Manchester Society of Architects, of which he was president in 1901-2. As president he was a member of the Joint Committee for the establishment of a Chair of Architecture at Owens College. In 1897 he wrote and published an autobiography under the title of "An Architect's Experience, Professional, Artistic, and Theatrical." For the portrait reproduced on this page we are indebted to the "Manchester Evening Chronicle."

Notes and News.

ANCIENT WELSH MONUMENTS.—In the House of Commons on July 8th, Mr. Asquith, in reply to Mr. Rees, said that he had under consideration the desirability of appointing an Archæological Commission to report upon the preservation of the ancient monuments and buildings in Wales. It was proposed to appoint such a commission.

* * *

NEW TOWN HALL AND LAW COURTS FOR HULL.—The Law Courts in connection with this building were opened on July 6th. The work occupied about 2½ years to carry out, at a cost of about £44,000, exclusive of fittings. The architects are Messrs. Russell and Cooper,

THE LATE MR. ALFRED DARBYSHIRE, F.R.I.B.A.

F.F.R.I.B.A., of London, the builders Messrs. Quibell and Son, of Hull, the clerk of works being Mr. J. Fraser. The sculpture and stone carving are by Mr. Albert Hodge; fireproof construction by Messrs. Stuart's Granolithic Co.; heating, ventilation, and steel casements by Messrs. Henry Hope and Sons, of Birmingham; lead work and glazing by Mr. William Smith, of Balcombe Street, London, N.W.; electric wiring by Mr. Shaw, of Hull, and the special fittings by Mr. Nelson Dawson, of Chiswick; marble work and staircase by Messrs. J. Whitehead and Sons, of Kennington Oval; and the mosaic by Messrs. Diespeker and Co.

* * *

THE A.A. SCHOOL OF ARCHITECTURE.—The annual exhibition of drawings made in the Architectural Association School of Architecture will be held on Friday next, July 17th, at 18, Tufton Street, Westminster, from 3 to 6.30 p.m.—The following is the list of awards in the competitions and prizes for the session 1907-8:—A.A. travelling studentship (value £25) and silver medal, Mr. Percy May; second prize (value £5), Mr. E. A. R. Rahbula. A.A. medal and prize value ten guineas, Mr. T. Braddock; hon. mention and special prize value ten guineas, Mr. L. Mansfield. A.A. essay prize (value ten guineas) and silver medal, Mr. L. M. Gotch. Banister Fletcher Bursary (value 25 guineas) and medal, Mr. W. T. Jones. Advanced Class of Design, prize (value five guineas) and bronze medal, Mr. T. Braddock. Elementary Class of Design, prize (value three guineas) and bronze medal, Mr. G. G. Wornum.

* * *

THE RECONSTRUCTION OF DRURY LANE THEATRE after the recent fire, is being proceeded with under the direction and to the designs of the architect, Mr. Pilditch. It is intended to complete the work for the autumn drama in September.

* * *

CROSBY HALL TO BE TRANSPORTED TO CHELSEA.—It has now been definitely decided to transport the remains of Crosby Hall from the City, and to re-erect the hall at More's Garden, Chelsea Embankment. The estimated cost, including the removal, is from £11,000 to £12,000, and of this sum £6,000 has been promised in subscriptions.

* * *

IN THE DEVELOPMENT OF ITALIAN PORTS, on which project the sum of £5,481,720 is to be expended, definite projects are being pushed forward for minor works as well as for the larger ports, and probably the greater part of the works will be started during next summer. A considerable amount of concrete blocks, also reinforced concrete for minor works, will be employed.

* * *

A NEW OUT-PATIENT DEPARTMENT has been provided at the Hospital for Sick Children in Great Ormond Street, Bloomsbury, by Mr. W. W. Astor, in memory of his daughter. The old waiting-hall and consulting rooms had grown so crowded that it was impossible efficiently to carry on the pressing work of the hospital. This valuable addition meets the needs that have arisen, and it is estimated that between 30,000 and 40,000 patients will pass through it annually, receiving the great benefits of the skill and care of the medical and nursing staff.

* * *

MR. LESLIE WILKINSON, A.R.I.B.A., has been appointed assistant in the Architectural Department at University College, London, in succession to Mr. A. G. James. There were 66 candidates. Mr. Wilkinson, when a student at the Royal Academy, gained the following prizes there: Silver medals for measured drawings and perspective, £10 premium (Lower School), £25 premium (Upper School), £60 travelling studentship (England), and the gold medal and foreign travelling studentship (£200). He also gained the R.I.B.A. silver medal and prize of ten guineas for measured drawings.

* * *

CANDIDATES FOR SHEFFIELD CITY ARCHITECTSHIP.—From 147 applications for the post of City Architect at Sheffield the following have been set down for the final selection:—Mr. William Eaton, A.R.I.B.A., Cardiff; Mr. F. E. P. Edwards, F.R.I.B.A., City Architect, Bradford; Mr. J. Stockdale Harrison, F.R.I.B.A., Leicester; Mr. Reginald G. Kirkby, A.R.I.B.A., architect to the Glamorgan County Council; Mr. T. W. Newbould, City Surveyor's Department, Sheffield; and Mr. J. H. La Trobe, F.R.I.B.A., Bristol. The commencing salary attaching to the post is £650 per annum.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Formulæ for Strengthening Fir Posts.

BRISTOL.—CONCRETE writes: Please state whether Hodgkinson's formula for wood columns—namely, $7.81-\frac{D^4}{L^2}$ is safe for designing temporary struts for concrete floors (with a factor of 5). Or would Rankine's be safe to work to with a factor of 3 if the struts are efficiently cross-braced?"

By a common rule, the safe load on a fir post not exceeding 10 diameters long is 4-cwt. per sq. in. sectional area: 15 diameters, say, 3-cwts., 20 diameters, say, 2-cwts., 25 diameters, say, 1½-cwts. For a 6in. by 6in. fir post 10ft. long this gives 36×2=72 cwts. safe load. By Rankine's formula the safe load in cwts. on a 6in. by 6in. fir post 10ft. long would be $\frac{7A}{1+\frac{l^2}{250d^2}}=\frac{7\times6\times6}{1+\frac{120}{250\times6^2}}$ =97-cwt. Hodgkinson's formulæ are very little used now.

HENRY ADAMS.

Acoustics of a Public Hall.

SURREY.—INSTITUTE writes: "In the hall of an institute, trouble arises from reverberation when there is speaking or singing. The fewer the people in the room the greater the trouble from the echo. Please advise as to remedial measures."

Without detailed investigation, we can only say that probably the wall surfaces are not sufficiently absorptive. The difficulty that exists of making words intelligible when only a few persons are about arises from the fact that clothed bodies are absorptive of sound. To overcome the trouble, absorptive materials of some description must be used for covering the surfaces of the building. Mats on the floor as well as curtains of soft fabric hung on the walls might be found to make the building less resonant. The problem is capable of approximately accurate solution by making proper calculations, and we recommend our correspondent to consult an expert.

Formulæ for Retaining Wall.

CLAYTON (STAFFS.).—CONCRETE writes: "Kindly supply formulæ for calculating the dimensions of a retaining wall, when it is constructed of (1) brickwork, (2) concrete, (3) simple reinforced concrete, such as could be done by unskilled workmen. The wall is to be erected at the back of some cottages on a hillside, to support an existing 18ft. roadway, the level of which is 16ft. above the foundation level of the cottages. On the opposite side of the road are four cottages, one pair against the road and the other two about 30ft. back. The subsoil is sand and gravel. The principal traffic on the road consists of coal carts to and from a waterworks, to which the road is the only approach. What would be the approximate price per yard of the wall when constructed of any of the above-named materials, sand and gravel being obtained on the site, and bricks delivered at 27s. per 1,000? How shall the road be supported while the ground is being excavated for the cottages and the wall being built?"

Some easy rules for calculating the thickness of brick or concrete retaining walls have already been given in the articles on "Retaining Walls" recently published in THE BUILDERS' JOURNAL. Good reinforced concrete requires to be made under experienced supervision. We have not space to deal with the design of retaining walls in reinforced concrete. There are no simple formulæ, though the treatment of the problem is not particularly difficult, but it must be dealt with in detail if dealt with at all. Of course, a reinforced concrete retaining wall contains a much smaller mass of material than a brick wall. It is almost impossible to give anything like an approximate estimate for such work, because so much depends on the conditions of the problem, and the district. Roughly, the cost of the concrete, including the steel reinforcing, might be placed at £2 per cub. yd., including the shuttering, but not allowing for the retaining of the earth while the wall is in course of construction. As regard the cost of a brick retaining wall, we think our correspondent will be able to determine this himself by estimating in the ordinary manner, having regard to local conditions. In constructing the wall the work should be done in sections, and the ground cut away and temporarily supported by laggings and props.

Ascertaining Stresses in Roof Truss.

GILLINGHAM.—H.G. writes: "Please explain how to draw the reciprocal figure and so obtain the stresses for the roof truss loaded as shown in full lines in Fig. 1. Is it correct to draw the diagram by assuming that the loads X and Y are transferred to the positions shown dotted?"

To obtain the stress diagram for this case, we must first calculate the stress in the bar OH, by the method of moments. This is obtained by taking the moments about the node Z of all the forces to one side of it, and dividing by the vertical distance from Z of the bar OH. Taking the loads X, Y, as equal to the loads 1, 2, etc., and equal to W, this gives the force in OH equal to 4.88 W. If the loads have not this value, their actual value must be used in calculating the moment about the point Z. The points 1, 2, 3, 4, etc., are then placed on a vertical line, as shown in Fig 2, to represent the loads, and *oh* is drawn horizontal, equal to the value calculated for the stress in OH (4.88 W in this case). Having obtained the point *h*, the reciprocal figure is then drawn by the ordinary rules, and comes as shown in Fig 2. This diagram would not be the same as if the loads were in the position shown dotted in Fig. 1. This will be seen by considering Fig. 3, which shows the reciprocal figure drawn for the loads X, Y in the dotted position. The force in OH in this case comes 4.59 tons by the method of moments, but this need not have been calculated in this case, as the diagram could have been obtained by Barr's method of replacing the bar DE EF by a single bar. A comparison of Figs. 2 and 3 will show the difference in the stresses for the two methods of loading.

Fig. 3.

Qualifying for Registered Plumber.

SEVEN KINGS.—A.V.J. writes: "What is the usual course to pursue in order to become a Registered Plumber? And where in London (or preferably in Ilford) can the requisite tuition be obtained?"

Apply to Mr. W. R. E. Coles, Adelaide Buildings, London Bridge, E.C. for particulars of the examination qualifying for Registered Plumber, and ask at the same time whether he will kindly inform you where you can obtain suitable instruction. Enquiry should also be made at the nearest technical institute and at the East London College.

HENRY ADAMS.

Architects, Builders, etc., in Parliament.

CRICCIETH.—J.E.G. writes: "I should be glad to know the names of all the architects and builders who are at present members of Parliament."

A glance through "Dod's Parliamentary Companion, 1908" (Whittaker and Co., 3s. 6d. net), reveals the following cases that are more or less relative to the enquiry. In each case the constituency represented is given between parentheses. Mr. A. C. Morton (Sutherlandshire), architect and surveyor; Mr. J. E. Seal, F.R.I.B.A. (Cheltenham), architect; Mr. T. B. Silcock (Wells), a partner in the firm of Silcock and Reay, architects and surveyors, Bath and London; Mr. A. Finlay (North-East Lanarkshire), structural engineer and steel bridge builder; Mr. C. C. Hyde (Wednesbury), vice-president of S. Pearson and Co.; Sir W. D. Pearson, Bart. (Colchester), head of the firm S. Pearson & Sons; Sir D. F. Goddard (Ipswich), civil engineer; Mr. A. Lupton (Sleaford), civil and mining engineer, and Mr. J. F. Mason (Windsor), chairman of Mason and Barry. Mr. W. Wilson (Westhoughton) and Mr. Hedley Vivian (Birkenhead) are described as carpenters and joiners; Mr. S. Collins (Kennington) is a stone merchant and contractor; Mr. T. W. Dobson (Plymouth) is a Croydon timber merchant; and Mr. Batty Langley (Attercliffe) is a well-known Sheffield timber merchant. Mr. R. W. Essex (Cirencester) is a well-known wall-paper manufacturer; and Mr. H. Greville Montgomery (Bridgewater), is, of course, the founder of the Building Trades Exhibition. Possibly there are others.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

Coal Residues in Reinforced Concrete.

In the House of Commons recently, Mr. Ridsdale asked the President of the Local Government Board if he was aware that the use of coal residues in reinforced concrete for building purposes had been forbidden throughout Germany on account of its danger; whether such materials were in common use in this country; and, if so, what steps, if any, he proposed to take? Mr. John Burns, in a printed reply, stated: I have no official information as to the use of the materials referred to being prohibited for building purposes in Germany. I have, however, seen some statements in the newspapers to this effect. I am aware that these materials are in common use in this country, and I propose to obtain some further information as to the result of such use, and also as to how the matter has been dealt with in Germany.

A Valuable Aid-book.

It is not our custom to review books in the leader columns, but we feel that the subject of this note is of sufficient importance to warrant special attention being directed to it here. Messrs. Marsh and Dunn's large book on reinforced concrete is now well-known, and a recognised standard text-book. Notwithstanding its large size, it can be referred to fairly conveniently, but, of course, for everyday pocket-book service it is unwieldly, and in frequent consultation engineers doubtless must find that it wastes a certain amount of time. To remedy this, the authors, Messrs. Charles F. Marsh, M.I.C.E., M.Am.Soc.C.E., M.Inst.M.E., and Mr. William Dunn, F.R.I.B.A., have issued a small "Manual of Reinforced Concrete and Concrete Block Construction," which has just been published by Messrs. Archibald Constable and Co., Ltd., price 7s. 6d. net. The object of this manual is to provide in a concise and handy form for everyday use, for the solution of everyday problems, the necessary information required in the design, construction, and supervision of reinforced concrete work. The authors have been very painstaking, and their work deserves every praise. It will undoubtedly be found of very great value by engineers. Any criticisms that we may offer are not designed to depreciate the value of the work, but purely with the object of pointing out what seem to us to be directions in which it might, in future editions, be made of still greater value. The book is divided into seven parts—(1) materials, (2) construction, (3) waterproofing and fire-resistance, (4) loads, bending moments, etc., (5) calculations, (6) hollow concrete blocks, and (7) tables, diagrams, and general information. The chapter on materials is an admirable summary, but in regard to the information furnished on special reinforcements we think those reinforcements which are not in use in this country should be omitted. It was valuable to give them in the larger book, but in this handbook they are of no value. In the chapter on construction the information regarding moulds and false work is of far too general a character; there is room for some real practical information, giving some typical details of form construction, and memoranda regarding the strength of timber, etc. We think it rather a pity that the set of instructions issued by one specialist company to their superintendents, inspectors, and foremen should have been reprinted. The information applies more or less to the particular type of construction which this firm employs, and the matter savours somewhat of an advertisement, whereas we feel sure the authors could have written a set of instructions that would have been more serviceable to the general professional public. As regards waterproofing and fire-resistance, the former is dealt with shortly, but the latter has rather too much space devoted to it. The chapters on loads, bending moments, calculations, etc., are decidedly the best part of the book. Since the third edition of their large volume was published, the report of the Reinforced Concrete Committee appointed by the Royal Institute of British Architects has been issued, and the authors have generally followed the recommendations contained therein, recalculating and re-drawing the tables and diagrams given in the larger book on the basis of the Committee's suggestions. In their larger work many of the tables are of great service in saving labour in making calculations, and these have been gathered together in the present handbook, while many new tables and diagrams have been given, which increase its value considerably. The authors display much originality in the drafting of such tables and diagrams, and they deserve the thanks of those who have made a special study of the subject. We are inclined to think that the chief value of their work is in this direction, and that it gives the volume the foremost place for purposes of instruction and frequent consultation. Continental authors exhibit perhaps more originality in regard to the theory, and some have undertaken a great deal of experimental investigation that is most important, but they have omitted to put their information into a practicable and serviceable form. It has been left for Messrs. Marsh and Dunn to digest the theories and experiences of others, and to summarise and co-ordinate them for the ready consultation and use of architects and engineers. The summary of methods and calculation is short, but it is not made unintelligible by too much abbreviation; just sufficient seems to be given for the arguments to be followed by anyone who has made a study of the subject in larger works, while to those who are not very familiar with it sufficient clue is given to enable them to search out a fuller argument in the bulkier treatise. The only material objection we have to make to the authors' treatment is that we think a set of symbols might have been chosen which would be a little more intelligible than those adopted. The authors, we suppose, felt it advisable to continue to use many of the symbols they adopted in the larger work; and it would certainly seem inconvenient, in referring from one to the other, to have an entirely fresh set of symbols. But there will have to be some standardisation in the matter before long, and if a list were made of the symbols used by various authors, a majority would be found in favour of certain symbols which would be entirely different from those employed by Messrs. Marsh and Dunn. We think they would be well advised in future editions of their larger work, and in this smaller one also, to radically alter their shorthand. In respect to the information on bending moments we might say that formulæ should be given for other systems of loading, as also for what is known as the "mushroom" system of cantilever construction, and the allied subject of independent foundations to columns. The information provided in respect of calculations for arches is not very clear, and we think it could be rewritten so as to be much more direct and more intelligible. For comparison, we would cite the treatment of the subject in Turneaure and Maurer's "Principles of Reinforced Concrete Construction." The chapter on hollow concrete blocks is rather disappointing. It is too short to be of much service, and the authors seem to have obtained their information from American sources. All the information they give consists of quotations, and the practical value of the chapter is very little. The tables, diagrams, and general information at the end of the book are, however, all very valuable.

The Milan Catastrophe.

The collapse of a reinforced concrete building at Milan, which has caused some little trepidation in the minds of the public casually interested in this form of construction, seems to have occurred when the structure was being tested. It is very regrettable that so many were killed by the collapse, and, on the face of it, it seems to be foolish that any risks should have been run by having the men about the work when such a test was in progress. But the contractors must be excused somewhat, because they could not have had any idea that the structure was so dangerous, and may have thought that any signs of weakness would have made themselves apparent soon enough to have allowed means to be taken to prevent any collapse. At the time of writing we are not in possession of full details, but it seems evident that there must have been grave defects to have caused such a sudden collapse. The ordinary test is not designed to discover such errors in construction. It should be realised that a test on a reinforced concrete structure cannot be severe enough to represent the maximum loading for which the structure was designed, for the test takes place before sufficient time has been given for the construction to mature and gain its maximum strength; indeed, a test may show that a structure will sustain a load equal to that which it will be called upon to sustain when completed and in service, but at that point it may be just upon collapse and may have no adequate factor of safety. In short, a test can never take the place of thorough

inspection and careful workmanship in the construction, which latter give far greater safeguards than any tests. Some contractors are very fond of making tests after a building is constructed, with the object of proving to the architects, engineers, or owners, how good their work is, but they often take the precaution that the test load is not in any way a practical test. For instance, a load is often placed upon one small panel of a continuous monolithic floor, with the result that a very good showing is made for that particular floor panel; but as the load is really transmitted over adjacent floor panels the actual strength proved is very little. All sorts of schemes are adopted in regard to these tests, and the reports which are circulated to the press generally contain the results, but no details whereby the value of the tests may be determined. Tests of this kind only make one suspicious of the work of such constructors, and those who have specialised in the subject are inclined to question whether proper care has been displayed in construction, for they cannot help wondering whether these tests are not perhaps intended as blinds to disguise such facts. Tests conducted by specialists without the supervision of independent experts, indeed, may be generally dismissed as valueless. A systematic test may be of some value, and this collapse at Milan may be regarded as a warning that we should not run risks, but should take such precautions in the application of loads that there may be no risk of life.

COKE-BREEZE AND CLINKER CONCRETES.

Coke-breeze and clinker, as aggregates for concretes, have been extensively used by constructors for many years past, and though they have received favour in this way, there has recently been an outcry in certain quarters against the use of these materials, which have been condemned *in toto*, especially for reinforced work. We have had our attention again attracted to the subject by a letter from a firm of civil engineers, architects and surveyors, which we here print in full, together with the newspaper extract accompanying it.

Our correspondents say:—"Attention is drawn to a letter published in the 'Times,' copy of which we enclose. Like many other architects, we have specified cinder as an aggregate, and an alarming statement of this kind comes as a shock. Have you any expert experience in the matter with which you could furnish us?"

Extract from the "Times," June 17th, 1908.

'CINDER CONCRETE.—Mr. Albert E. Bullock, of 43, Chancery Lane, W.C., has written in regard to an extract from the "BUILDER" of April 18th, published in the "Times" Engineering Supplement of April 29th, which states that a law has been passed in Berlin applying to the whole of Germany forbidding the use of coal residues as an aggregate for concrete. Mr. Bullock says that 'the danger of using cinders as the aggregate in concrete has long been recognised by experienced architects and engineers in England, but until legislation prohibits the use of the "breeze," as it is commonly called, the practice will continue. Not only does the contact of the cinders with steel deteriorate the effective power of the latter, but the "breeze" itself decomposes eventually to a powder. Metal lath partitions of cinder concrete construction have been known to be entirely useless in twelve months after erection. A floor in Germany failed after three years, although it is said to have resisted ten cwts. to the foot at the outset, the "breeze" having quite perished. It will be interesting to know the experience of your readers on this material. In the opinion of the writer, it will only require a few years to bring about a series of disasters which will result at least in the insurance companies refusing to insure against accident in so-called fireproof buildings constructed with cinder concrete and steel. It rightly falls within the provinces of the Local Government Board and the London County Council to insert clauses in the Model By-laws prohibiting the use of cinder concrete in floor construction in future, but as all these things can only happen by Act of Parliament, doubtless, as usual, the gate will be shut after the horse has scaped.'

Another correspondent sends us an enquiry asking:—

"What are the characteristics of good coke-breeze for concrete? What are the merits of boiler ash or slag now largely used as 'breeze' for concrete as compared with real coke-breeze? Also as regards destructor ash. Is either fit for floors, lintels, etc., which have to take strain? Can iron reinforcement be safely used (as regards risk of chemical decomposition) in breeze-concrete?"

Our opinion on the matter is as follows:—

Definitions.

First, it is necessary to define what is meant by the terms "cinder," "breeze," and "clinker," because they are used in a rather loose manner. In the United States concretes of this class are known generally under the term "cinder concrete," but while this relates at one degree of the scale to what we term "clinker," it may include at the other end of the scale the very objectionable ashes from ordinary domestic fires, which are full of dust and unburnt coal. Anything in the nature of fine dust is deleterious to the setting of the Portland cement, while coal has been stated by some persons to have caused concrete to disintegrate, the reason advanced being that the coal gives off gases which shatter the concrete. Personally, we think this latter reason is entirely inadequate, because concrete is not so impervious that such gases, generated in the small quantities that they would be, could not escape; moreover, even if they could not escape, in actual practice they are present in such a small quantity that they would not possess sufficient explosive force to shatter the concrete.

As to whether the decomposition of coal by the evolution of such gases is of such nature that it causes increase in volume, which expansion fractures the concrete, this may be a possible explanation, and we see some reason perhaps in thinking that this may have caused flaking on the surface of concrete lintels, which we believe were the examples that have been referred to as evidence of this action of coal. But, so far as we have been able to ascertain, it was not stated that in these particular examples the mass of the concrete was disintegrated, whereas, on the other hand, we have seen an example of concrete that has been made for many years containing a considerable quantity of small particles of coal mixed with the aggregate, and no deleterious action has taken place.

The small unburnt, or partially burnt, pieces of coal and coke obtained by sifting ashes in dust-yards are often termed

"Pan Breeze."

Although sifted, they are still full of dust, and the coal and ashes contain sulphur, soluble alkalies, etc., which affect the setting of the Portland cement, and may cause disintegration after the concrete has set and hardened for a time. Ashes from domestic grates are therefore treacherous material, but though we strongly warn everyone against them, we would not condemn any material outright, because it is just possible that, in certain circumstances and with some special treatment, it may be possible to prevent or counteract the evil defects generally inherent in the material.

Coke-breeze is very different from pan-breeze; it is really small coke obtained from gas works. It is, however, of various sizes, and if very fine it may contain much dust, which is harmful—as all dust is—to the strength of concrete. Coke-breeze, too, may contain a large quantity of sulphur, though, as a rule, the amount of sulphur is so small as to be negligible. Sometimes, also, coke-breeze is not properly stored at the yards, and so gets mixed with a quantity of fine coal, to which objection must again be taken.

"Clinker."

"Clinker" is a term used widely for several varieties of ashes, more or less vitrified. Some consist of the ashes obtained from the fire-boxes of railway locomotives and stationary engines. The fuel used in such fires is not the best quality coal, and it often contains a considerable quantity of limestone and sulphur. The former becomes calcined by burning into the form of quicklime, which of course is highly objectionable, and probably will cause disaster to concrete made therewith. The sulphur is perhaps left behind in a condition which results in the formation of sulphurous or sulphuric acid, highly injurious to Portland cement.

But when clinker is obtained from a proper furnace, such as the fires of boilers under forced draught or high temperature, and from dust-destructors, the material is often excellent; the ashes have then become thoroughly vitrified, and if limestone has been present it has acted only as a flux under such high temperature, and no longer remains as quicklime. Such furnace clinkers, however, while in the majority of cases excellent material, need to be watched, for they may be sometimes obtained from destructors burning refuse which contains chemicals or ingredients that may be extremely harmful to Portland cement. We know, for instance, of one case of clinker obtained from a destructor in a large provincial town which gave a crushing strength with a concrete made in the proportion 1 : 2 : 4 of 2,000lbs. to the sq. in. at one month, but fell off to a crushing resistance of half that amount at the end of three months, and if these experiments had been continued still further depreciation would probably have been shown. On the other hand, some clinkers are so vitrified and hard that they would provide concrete of very high crushing resistance, probably giving up to 3,000 to 4,000lbs. per sq. in., proportioned 1 part cement, 2 sand, and 4 clinker.

Clinker may contain dust, and contractors sometimes obtain it from destructors immediately it is turned out, so that it is still hot when brought on the work and used. Naturally a hot material like this is most harmful to the Portland cement, and very often prevents it setting.

Clinker is usually of large size and needs to be broken or crushed for fine work, such as floors, etc.,

Relative Merits of Coke-breeze and Clinker.

Having now surveyed the character of the materials passing under the names of "coke-breeze" and "clinker," we may consider their use for concrete, their advantages and disadvantages.

Both clinker and coke-breeze are (1) light in weight, (2) porous, (3) possessive of what is known in the trade as "suction."

Coke-breeze possesses these qualifications in a greater degree than clinker.

The lightness is an advantage in certain circumstances, as, for instance, where floors have to be of a certain thickness but are not required to be of great strength. For this reason these aggr

gates were often favoured with the older type of concrete floor reinforced with light steel joists, which practically sustained the entire load, the concrete not being called upon to provide compressive resistance, as in the modern type of reinforced concrete.

Concrete made with coke-breeze frequently acts like a sieve, allowing water to penetrate it readily. It is favoured for partitions, because it will take nails. The porosity may and may not result in the rusting of any steel reinforcement that may be embedded therein, but it depends upon the treatment of the materials. Before dealing with this aspect, we may briefly refer to the third characteristic, namely, the suction.

Coke-breeze and clinker have been favoured by artificial stone manufacturers for many years past because the external facing or skin of finer material used to form the surfaces of artificial stone blocks is found to unite well with the core of coke-breeze or clinker concrete, and has no tendency to crack or flake on the surface. In the manufacture, also, damage is occasionally done to the arrises, and these defects can be repaired with little trouble where such backing is employed. Of course, the facing will adhere thoroughly to a backing of harder and more impervious material, if it is all cast at one operation. Coke-breeze and clinker, however, are not only economical and light in weight, but possess the advantage of "suction."

"Suction."

This question of suction is very important to the proper treatment of coke-breeze as regards protection of the embedded steel against corrosion, etc. Formerly, coke-breeze and clinker were employed alone, without the admixture of sand, the cement forming but a small proportion, and as there were so many interstices and insufficient finer particles in the materials to fill the cavities, a concrete resulted which was full of hollows and was somewhat of the nature of a sponge, or volcanic scoria, or pumice stone. The materials, too, were employed dry, or with a very insufficient wetting, the result being that the suction that they possessed quickly withdrew the moisture from the mixture, and the concrete never set properly, nor hardened by maturing, by being kept in a well-wetted condition that is so essential for the production of good concrete. The compressive resistance of such concretes therefore was extremely weak, and it is not surprising that sometimes floors constructed with such concretes decayed and almost fell to powder in a few years, while the steelwork embedded therein rapidly corroded, because it was not covered with any cement, and water, moisture and air could penetrate directly thereto.

Some years ago a reader of this Journal forwarded to us a sample of concrete, and of the rust removed from the embedded steel joists, from the decking at the shore end of Southend pier. This we found to be coke-breeze concrete of the very worst kind, and the corrosion that had been expedited by the sea-air and occasional wetting with salt water was considerable.

The Necessity for Thorough Wetting.

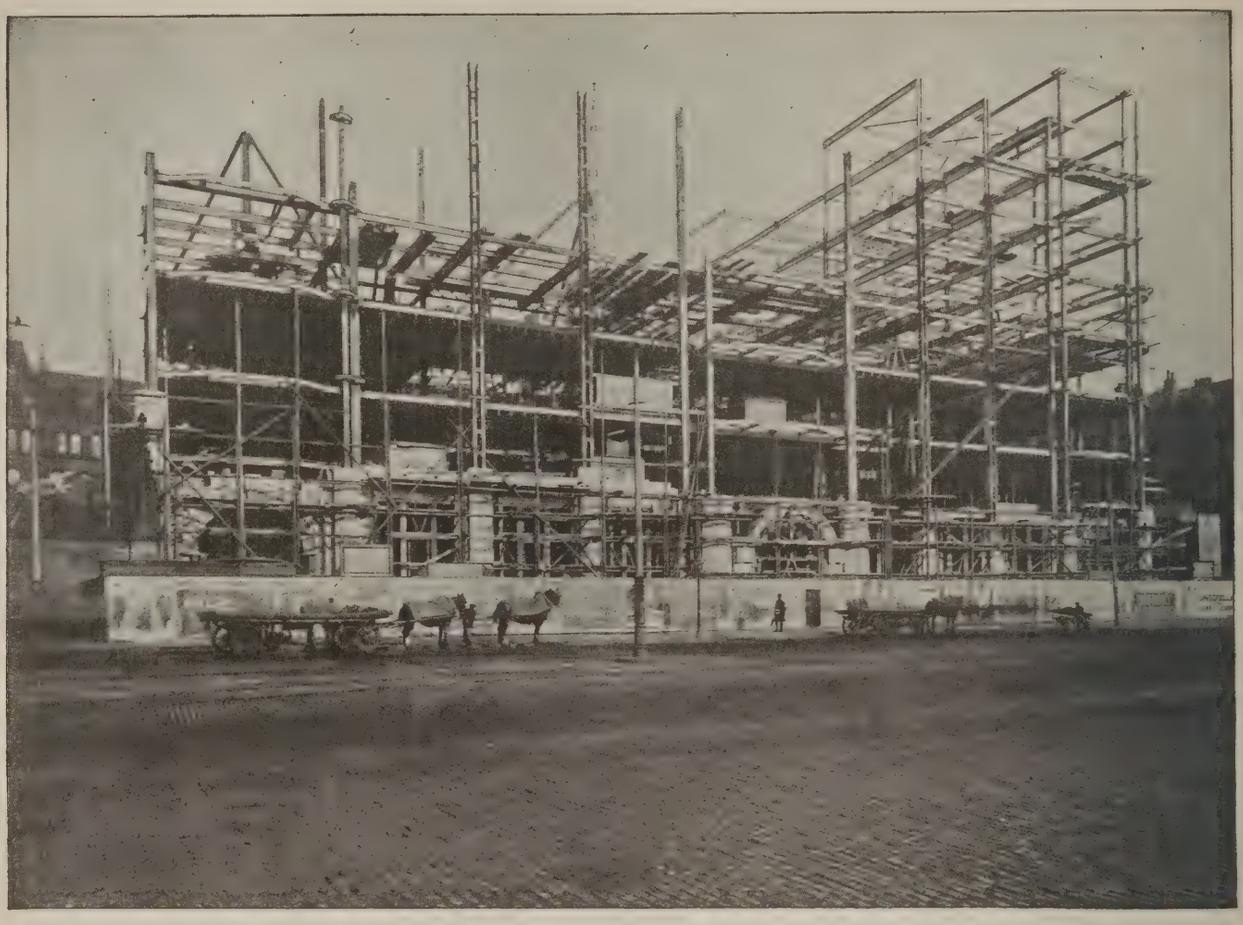
With the idea of producing a stronger concrete, and at the same time a more impervious concrete, it has become the practice nowadays to employ a proportion of sand with coke-breeze or clinker. This fills the interstices and improves the quality of the concrete. But it is important in using these aggregates to thoroughly saturate them with water before mixing with the cement and sand in the usual way, in order to avoid the "suction" withdrawing the moisture. The mixture must not be what is termed "dry" by reinforced concrete constructors: it should be of a slushy character, known generally as a "wet" mixture: it should quake like liver under the ramming, and the surface should almost swim with water. A large proportion of cement needs to be used, and the mixing should be thoroughly well done. The cement then penetrates into the whole of the mixture, and when rammed around the steel coats it with a film of cement grout, which is in itself a safeguard for many years, even if the remainder of the concrete be extremely porous, which, if made as we state, it will not be. We have plenty of examples to show the resistance which a thin wash of cement applied upon the steel affords against corrosion. Sand should always be added, so as to increase the density and compressive resistance, and make the concrete more impervious to moisture.

Coke-breeze and clinker possess the property of being more resisting against fire than ballast concrete, which splinters under heat, though this tendency is somewhat overcome if the concrete is crushed small. Coke-breeze, although it resists fire, does not flake and shatter as ballast concrete does, but is worn away a good deal (though apparently no more than ballast concrete) by water played thereon from a fire-hose. The old-fashioned coke-breeze concrete, however, was by no means fire-resisting, masses of coke-breeze having in the past been set on fire and burnt like a coke fire. We have known an instance of a plumber's stove upon a roof constructed of concrete burning a hole therein and dropping on to the floor below.

Conclusions.

We are aware of the law referred to above that has been passed in Berlin forbidding the use of coal residues as aggregate for concrete, but though the subject is a thorny one, and in regard to which many diverse views are held, we are inclined to think that the dangers in the use of coke-breeze (with which pan-breeze or cinders, often termed "breeze," must not be confused) and clinker are not so great as to warrant official prohibition of the use of these two materials, which are economical and can be used to good advantage with thorough safety.

We think that it is possible to frame certain regulations which shall ensure good concrete being made with such materials.



There has been too much disposition in the past to make regulations to secure the safety of structures built by the most ignorant and inexperienced builders with the worst materials, whereas the regulations should be framed to secure good workmanship and not to hamper those desirous of erecting efficient and sound constructions at an economical figure.

TOWER BUILDINGS, LIVERPOOL.

The large block of office premises known as Tower Buildings, Liverpool, is now in course of construction from the designs and under the supervision of Mr. Aubrey Thomas, architect, of Liverpool, on the site of the old Tower Buildings built at the bottom of Water Street. The main frontage faces the river, overlooking the Overhead Railway and extending from Water Street to St. Nicholas Church.

TOWER BUILDINGS, LIVERPOOL, IN COURSE OF ERECTION.

TOWER BUILDINGS, LIVERPOOL: VIEW SHOWING STEEL FRAME.

with a width of 220ft. The elevation to Water Street is 110ft. long. When completed the building will have a basement and eleven storeys in the centre, with nine storeys at each end.

As will be seen from the accompanying views, the building is of steel skeleton frame construction, the whole of the floors being carried by the frame, which also carries the external walls of Doulton's "Carrara" ware with brick backing. The steel frame rests upon solid foundations, about 1,300 tons of steel being employed. The whole of the steelwork is being erected with the aid of a 5-ton electric derrick crane having a gib 85ft. long, assisted by three smaller cranes. All drilling, riveting, etc., is being carried out by means of electrically-driven machinery.

The general contractors for the steelwork are Messrs. Redpath, Brown and Co., Ltd., whose works are at Trafford Park, Manchester, and who also have works in Edinburgh, Glasgow, and London. The erection is being carried out by sub-contractors, Messrs. G. H. Goodier and Co., of Bridgeman Street, Bolton.

The floors, roofs, and staircases, as well as the staircase walls and a great proportion of the partition walls, are constructed by the Kleine Patent Fire-Resisting Flooring Syndicate, Ltd. This type of construction with reinforced bricks was fully described in our issue of June 17th last in connection with our article on the new Westminster Trust Building, where the same floors are used throughout. Similar speed of construction by the Kleine Syndicate was observable in this case. The staircases in Tower Buildings, however, represent a novel and most interesting feature. The landings are constructed on steel joists cantilevered from the walls. This construction does away with the necessity of cranked strings, and as the Kleine carriage is built from landing to landing, no chase is required in the stair-walls, and consequently their strength is not impaired.

The area of floors in this building is about 17,000 yards, and their rapid construction and the assistance which the floors gave to the other contractors was greatly appreciated by the latter.

KLEINE FLOORS IN COURSE OF CONSTRUCTION.

SOME RECENT STEEL-CAGE BUILDINGS IN SAN FRANCISCO.

Since the conflagration which destroyed practically all of the business part of San Francisco in April, 1906, a large number of commercial and office buildings have been constructed on the devastated area. The more important of these buildings, at least, have been designed to conform not only to the general requirements of advanced practice, but also to combine fire-resisting qualities with a considerable resistance to seismic disturbances. As many of these buildings correspond in their general features, a brief review of a group embracing various heights and styles and adapted to occupation for various purposes will serve to show the types that have been erected.

Nearly all of these buildings have been constructed in open spaces where all of the former structures have been destroyed and completely removed, and the new ones had in general the advantage of being built without serious restriction from adjacent property and without special difficulties involved in the construction of their foundations.

Types of Foundations.

The San Francisco building law makes each owner responsible for the safety and integrity of his own foundations, regardless of adjacent operations, and it has therefore been considered good judgment, in cases where there was believed to be a possibility of deep foundations for the construction of very heavy structures adjacent, to safeguard the new building as much as possible from settlement or undermining which might be threatened by future operations. The general practice has been to make the excavation to be a little beyond ground water level and when solid satisfactory soil was found at that level to construct on it grillages of steel I-beams embedded in concrete, or footings of reinforced concrete proportioned to reduce the maximum load on the soil to about 4 tons per sq. ft. Where the soil is wet and soft, the foundations have generally been made with wooden piles cut off below water level, capped with concrete footings, often enclosing steel I-beams, and proportioned for a load of 15 to 20 tons per pile.

No Limit of Height.

Since the earthquake and fire, and up to 1907, the maximum height of buildings was limited to one-and-a-half times the width of the street, which resulted in a nearly uniform average of about 100 ft., or eight storeys above the curb and one story below it. This restriction has been only recently removed, and no height being now prescribed, some of the latest buildings are being designed and constructed up to fourteen storeys. None have yet been built, however, as high as the Spreckles Building, which is 310 ft. from the curb to the top of the dome. This building is about 75 ft. square and seated on a solid continuous platform, nearly 100 ft. square and 25 ft. below the surface of the ground, composed of two crossed tiers of full length steel I-beams, set close together and embedded in a mass of concrete 4½ ft. thick, with the columns securely anchored by heavy tension bars in beams in the lower tier.

Wind Pressure.

The building law requires provision for 30 lbs. wind pressure on all vertical surfaces and provides that the unit wind stresses may be increased 50 per cent. above the dead load stresses, thus allowing them to be 18,000 lbs. per sq. in. of the steel. Unit stress in the steel columns is taken at 12,000 lbs. per sq. in. up to $L \div R = 90$, above which they are reduced in accordance with the column formula. The usual allowance is made for a diminished percentage of the total load of the floors considered simultaneously transmitted to the columns from the top downward.

A group of fifteen building erected since the disaster by the Thompson-Starrett Co., New York, have fronts varying from about 50 to 140 ft. in length, with a height varying from four to fourteen storeys. Nearly all of them have stone or terra-cotta fronts and reinforced-concrete side and rear walls and reinforced-concrete slab construction for floors and roof.

Of all the buildings in San Francisco contracted for since the fire

the Eyre Building,

at Kearney and Sutter Streets, was the first one to be completed. It has fronts of 56 and 66 ft., and is eight storeys and basement in height. The street fronts are of cut granite, with carved trimmings in the lower storeys, terra-cotta trimmings above, and a steel and terra-cotta cornice. The framework is of very simple standard construction, with closed rectangular two-storey riveted columns and I-beam girders and floor beams. The column and girder connections are made with gusset plates to give stiffness against wind pressure. All steelwork is completely enclosed in concrete. That for the columns has a minimum thickness of 3 ins., and is reinforced and secured by small horizontal rods, about 12 ins. apart vertically, with their ends twisted together at the corners of the column.

The foundations are steel I-beam grillages seated on concrete footings about 4 ft. below the curb level and receive their column loads through standard cast-iron pedestals with grouted bearings on their top flanges.

As it was anticipated that deep foundations may hereafter be constructed on the adjacent plot, the integrity of these foundations was safeguarded by the construction of a concrete retaining wall below the cellar floor. A sheeted trench 120 ft. long was carried down to a depth of 40 ft. below the curb with considerable difficulty. In it was built a wall 25 ft. high with a uniform thickness of 5 ft. The sheeting was pulled on both sides of it and the trench was back-filled and rammed, so that little apprehension is felt from the development of unbalanced pressure induced by any future excavation in the neighbouring plot.

The retaining wall and foundations were made with 1 : 2½ : 5 concrete, Portland cement and 1½-in. broken stone, mixed in a Ransome machine at street level and delivered through a chute into the wall trench, the machine being moved along as required from end to end of the trench. The concrete for the foundations, cellar floor, and retaining walls, was delivered in 1-yd. steel buckets handled by a guyed derrick with a 60-ft. boom of 10 tons capacity.

The derrick was at first placed near the centre of the lot in the bottom of the excavation, and after the foundation work was completed was moved up from storey to storey with every second tier of beams. It commanded the whole area of the building and both street fronts, and was thus able to handle all material, and to unload and erect all of the 500 tons of structural steel in the building.

The contract for this building was awarded in August, 1906; excavation was commenced on October 1st, and the setting of the grillage beams was commenced about the middle of January, 1907. The erection of the steel framework was completed February 16th, the outer walls were finished about May 1st, and the building was ready for tenants July 1st. Mr. L. B. Dutton was the architect.

The Welch Estate Building.

Another steel-cage building is the 54 by 127 ft. 7-storey structure on California Street, for the Welch Estate. The soil here is a 10-ft. fill, with the water-level 9 ft. below the curb, and the three longitudinal rows of columns are seated on steel grillages with concrete footings supported on and enclosing piles from 25 to 30 ft. long, driven to a refusal of 2 or 3 ins., in open sheet-pile coffer-dams, cut off below water level and loaded to a maximum of 15 tons each. The tops of the grillages are below the unobstructed cellar floor, which is itself 6 ins. above water level. The reinforced-concrete cellar retaining walls and the cellar floor are waterproofed in the usual manner with tarred felt.

The structural steel weighs about 600 tons, and is of simple standard design, with details corresponding to those already described for the Eyre Building. It was erected with an average force of about 20 men in about 60 days by a single centrally located stiff-leg derrick, with a 60-ft. boom of 10 tons capacity. The derrick was raised every second tier in the same manner that is customary for a guyed derrick, the unshipped boom serving as a gin-pole to hoist the mast, stiff-legs and sills, which were handled without being taken apart. The derrick was usually shifted in about 4 hours by a force of 6 men, and when in service was anchored by screwed clamps to the erected girders. It was operated by a double-drum Lidgerwood hoisting engine permanently located in the cellar. The boom commanded the street and unloaded the steel from wagons there, often erecting the columns and girders without rehandling, and at other times storing them temporarily on the upper tier in positions convenient for erection as required.

In this building all of the walls are of brick, which in the street front was laid from an exterior scaffold suspended by Manila tackles from 12-in. by 16-in. horizontal beams about 25 ft. long and 8 ft. apart, laid on the finished roof with their ends anchored to the girders, and the opposite ends cantilevering about 8 ft. beyond the front wall girder and passing through the cornice framework to support the outside suspension tackles.

Construction was commenced about the first of March, the foundations were completed in April, the steelwork was all erected by July 1st, 1907, the exterior wall was finished early in October, and the building was ready for tenants January 1st last. Mr. O. G. Traphagen was the architect.

The Metropolitan Bank Building.

Another new building is that for the Metropolitan Trust and Savings Bank, on Market Street. This building, which is fourteen storeys in height, has about 900 tons of structural steel in its framework, which was completed in 60 days by an average force of 40 men. Its steel columns have cast-iron bases seated on concrete footings at a depth of about 14 ft. below the curb. The exterior walls are supported at every floor by special girders, which have such deep and rigid con-

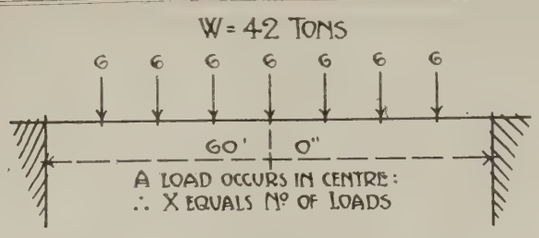


FIG: 1

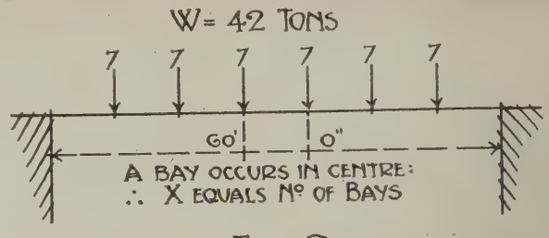

FIG: 2

nections to the columns that special wind bracing is considered unnecessary.

The cellar excavation, 12 ft. in depth, was protected by hand-driven wooden sheathing and is enclosed by a massive monolithic-concrete retaining wall, without reinforcement, which was cast in forms built up like those usually adopted for buildings, and removed after its completion. The wall does not depend for its strength on bracing provided by beams and girders at street level, as many basement retaining walls do, but has independent stability due to its own weight and strength and a base with a width of one-fifth of its height. All of the excavation and erection work was handled by a single stiff-leg derrick, and neither the design nor construction was of unusual character. Mr. L. B. Dutton was the architect.

The Schmidt Building.

This building is of eight storeys. It has cast-iron column pedestals seated on I-beam grillages, and has reinforced-concrete floor slabs, cut-stone front walls and red brick rear walls. The steel framework is of standard construction, except that in every lower tier the wall columns support lattice-girder wall beams about 5 ft. deep, with their top flanges just clearing the window sills. Their deep web connections to the columns give great transverse rigidity to wind stresses and vibrations, and are relied on to provide adequately for any earthquake shocks to which the building may be subjected. In the eighth and ninth tiers the lattice girders are replaced by plate girders 30 ins. deep. The interior floor beams and girders are of the usual I-beam type, of maximum spans of about 16 ft., and have web and flange connections to the columns.

During erection the principal front was provided with a protecting platform over the pavement, which was used for the contractor's office, storage and stone cutting. The front walls were laid from platforms suspended by steel ropes from cantilever beams anchored to the upper tier of I-beams. The platforms extended continuously around the two sides of the building and were moved up together. All bricks and concrete were hoisted by hod elevators operated in a tower constructed in the middle of one front of the building on the sidewalk. This building contains about 500 tons of structural steel, erected by the general contractor, as in the other cases mentioned. Its steel erection was completed in 45 working days. Mr. Albert Pissis was the architect.

For all the buildings here described the general contractor was the Thompson-Starrett Co., New York, Mr. George Simpson chief engineer, and Mr. Louis R. Bowas superintendent in change. The structural steel was made at the Pencoyd plant of the American Bridge Co.

A SHORT CUT TO BENDING MOMENTS ON SYMMETRICALLY LOADED BEAMS.

By D. W. Robertson.

When a beam is subjected to a series of equal loads which divide the span into equal bays—for instance, in the case of a beam carrying the small joists of a concrete floor—the draughtsman is very apt to neglect the elaborate methods of finding bending moments, and to consider the loading as "distributed." This practice errs on the wrong side—that of underestimating the bending moment, and although the discrepancy in the case of a large collection of loads may be slight, the designer should endeavour to arrive at the exact amount of work required to be done by his beam, and any give-and-take in the selection of the section can then be done with greater freedom.

By a very simple and labour-savin formula, the equal and equally distribute loads on any beam can be resolved into a equivalent distributed load, and th found, there is no difficulty in arrivin at the maximum bending moment. Th total load bears a fixed ratio to the equ valent distributed load, according to th number of small loads into which the tot is divided.

The formula is as follows :—

$$D = \frac{W(x+1)}{x}$$

where D = equivalent distributed loa and W = total actual load.

When a *load* occurs at the centre of t span, as in Fig. 1, x = number of *loads*

When a *bay* occurs at the centre of t span, as in Fig. 2, x = number of *bays*.

The formula for arriving at the ma mum bending moment thus becom

$$B.M = \frac{WL(x+1)}{8x}$$

The following examples will be eas followed :—

Fig. 1 shows a beam with seven loa of 6 tons each. A *load* occurs in the ce tre of the span; therefore x = number loads, = 7.

$$B.M = \frac{WL(x+1)}{8x} = \frac{42 \times 60 \times 8}{8 \times 7} = 360 \text{ ft.-tons.}$$

Fig 2 shows a beam with six loads 7 tons each, and a *bay* occurs in the ce tre; therefore there are seven bays, x = B.M. is accordingly 360 ft.-tons, the sa as before.

At first sight this seems strange, Figs. 3 and 4 show graphically that t is correct, the maximum bending mome being equal, the difference being that Fig. 3 the maximum is only reached

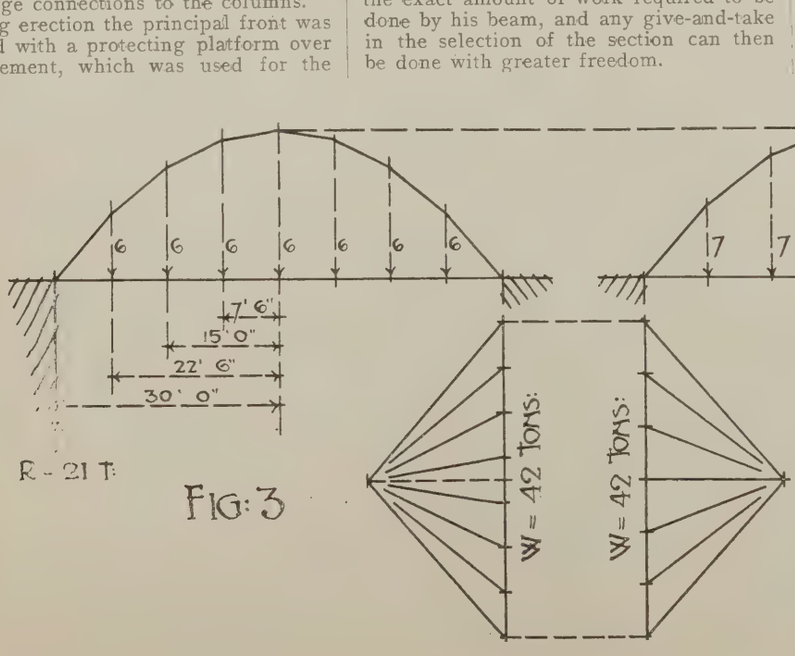

FIG: 3

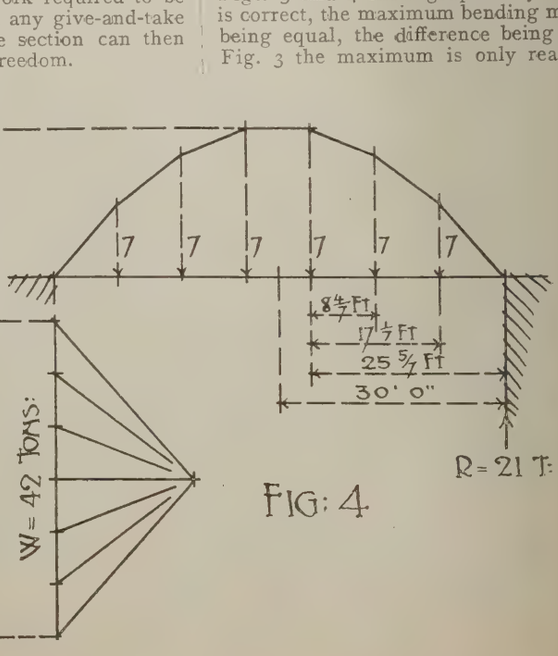

FIG: 4

he centre of the span, whereas in Fig. 4 t is constant over the length of the cen re bay.

This curious result will be found to pply in all similar cases, comparing two oads of value $\frac{W}{2}$ with three loads on the ame beam of value $\frac{W}{3}$, or any number, ay twenty loads of value $\frac{W}{20}$, with wenty-one loads value $\frac{W}{21}$.

The above examples may be proved by rdinary methods :—

In Fig. 3, B.M = 21 × 30 − (6 × 6″ + 6 × 15′ 0″ + 6 × 22′ 6″) = 630 − 270 = 360 ft.-tons, as before.

In Fig. 4 (moments about A) B.M = 21 × 25$\frac{5}{7}$ − (7 × 8$\frac{4}{7}$ + 7 × 17$\frac{1}{7}$) = 540 − 180 = 360 ft.-tons.

It will be seen that no number of concentrated loads can be accurately taken s a distributed load, and that the usual ext-book diagram showing a distributed oad on a beam represented by a number f spheres placed close together is to be ondemned as inaccurate and as misleading to the student.

THE STRENGTHENING OF REINFORCED CONCRETE COLUMNS.

By Henry Lossier.

(Translated from the French.)

It sometimes happens that the height f existing reinforced concrete constructions must be increased, which operation ises the often very delicate problem of rengthening columns already in istence.

The regulations of the French Governent of October 20th, 1906, do not permit resses exceeding 640-lbs. per sq. in., corresponding to a shortening of 0.008—0.012 . per yd., for ordinary concrete without lateral reinforcing. Under a shortening of 0.02 to 0.04 ins. per yd., the richest ncrete will collapse.

Two cases can arise : (1) If a column is eady loaded up to the maximum for hich it is calculated, any further ortening must be avoided; therefore, te only admissible solution is to let any ditional load be carried by the new nstruction entirely without connection th the existing column; (2) if, on the ntrary, the column carries only a part its normal load, it may undergo a rther shortening without exceeding the fe limit. In such case a strengthening the column in the proper sense of the rd may be obtained by efficiently conrcting it with a new column adjoining surrounding it.

The latter solution, however, can very rely be adopted by the ordinary method of nforcing, because the new concrete is a state of tension, owing to its adhesion the old concrete, which opposes its inking. The effect of the strengthening would commence only when the existing column was exposed to stresses nerally exceeding the safe limit, so that t help comes too late.

t follows that any strengthening which es not resist the lateral bulging of the ncrete is unable to solve the question the strengthening of reinforced conte columns already in existence.

On the contrary, the spiral system of nforcing invented by M. Considère ers a simple and rational solution of s problem. As a matter of fact, alled concrete can resist before crushg shortening up to 0.78—1.18 ins. per , and even up to 4.2 ins. when heavily nforced with spirals.

The strengthening of a column is carried out by putting it inside a suitably spiralled cylinder, after roughening its surface in order to secure a sufficient adherence between the new and old concrete. As has been explained at the beginning of the present article, the new concrete is put in a state of preliminary tension owing to the opposition which the old concrete offers to its shrinking. Therefore, when the strengthened column is loaded, the old core must experience a shortening sensibly equal to the nominal shrinking of the concrete before the new crust begins to help it. This shortening, which is nearly 0.008—0.01 in. per yd., causes a supplementary compressive stress of 0.008 × 1.3 tons per sq in.—0.01 × 1.3 tons per sq. in., which is no inconvenience to a concrete surrounded by a crust of spiralled concrete submitted to no stresses. Moreover, the initial tension of the external crust reduces the compressive stresses imposed on it, and consequently reduces the stress on the spiralled reinforcement.

This clearly shows that a column the core of which has set previously to the external crust is in a better condition of resistance than a column made in one piece.

It may be observed, further, that the great difference of pressure in the new and in the old concrete will completely disappear as soon as the limit of elasticity of the second is attained, owing to the rapid decrease of the co-efficient of elasticity, which is reduced to 1-10th its value.

The extension of the workshops of a French motor-car company at Levallois-Perret, near Paris, offers an interesting example of the strengthening of reinforced concrete columns by spiralling.

Fig. 1 is a section of the building showing the addition which has been made from the second floor upwards.

Figs. 2, 3, and 4 show respectively the sections of the columns of the basement, ground floor, and first floor previous to their strengthening. These columns are reinforced by longitudinal bars with cross ties in the ordinary way, 16 ins. apart.

In the following table are given the loads which these columns can safely carry, calculated in accordance with the French Government regulations. For this it has been assumed that the sections of

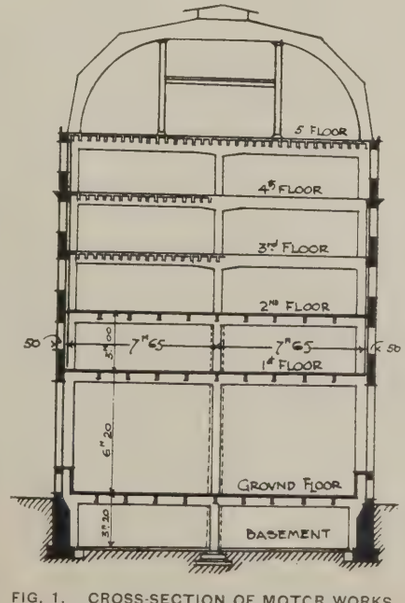

FIG. 1. CROSS-SECTION OF MOTOR WORKS AT LEVALLOIS-PERRET, NEAR PARIS.

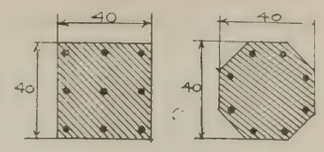

Fig. 2.

Fig. 3.

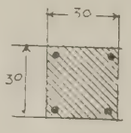

Fig. 4.

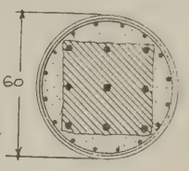

Fig. 5.

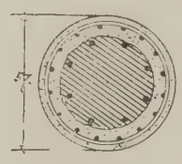

Fig. 6.

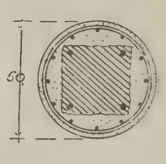

Fig. 7.

steel are equivalent to sections of concrete from 8 to 15 times larger, according as the diameter of the rods varies from 1-10th to 1-20th of the smallest dimension of the concrete. The co-efficient of equivalence is 11.5 for the first and second, and 8 for the third columns.

	Column of Basement.	Column of Ground floor	Column of first floor.
1. Sectional area of concrete	248 sq. in.	204.6 sq. in.	139.5 sq. in.
2. Sectional area of steel	7.98 ,,	7.13 ,,	4.09 ,,
3. Do. reduced to concrete	91.45 ,,	82.15 ,,	32.55 ,,
4. Total sectional area (1 + 3) ..	339.45 ,,	286.75 ,,	172.05 ,,
5. Safe load per sq. inch	0.285 tons.	0.285 tons.	0.285 tons.
6. Total safe load (4 × 5)	96.74 ,,	81.72 ,,	49 ,,

When, however, the new part of the building is finished the loads put on these columns will be respectively 215.63 tons, 131.1 tons, and 146.65 tons, and they would subject the columns without strengthening to pressures equal to 0.635 tons per sq. in., 0.635 tons per sq. in., and 0.855 tons per sq. in.

From the above developed considerations, and owing to the fact that the method of construction, which is further described, has allowed the load acting upon the columns during their strengthening, to be greatly reduced, the same methods of calculation have been applied to the strengthened columns as for columns entirely built at one time.

The molecular stresses thus obtained, after strengthening in the columns (sections of which are shown by Figs. 5, 6, and 7), are recorded in the following table :—

	Column of Basement.	Column of Ground floor	Column of first floor.
Diameter of column	23.6 in.	22.45 in.	19.7 in.
1. Sectional area of concrete ..	438.18 sq. in.	395.4 sq. in.	304.26 sq. in.
2. Sectional area of steel	10.77 ,,	9.92 ,,	6.2 ,,
3. Do reduced to concrete (2) × 15	161.55 ,,	148.80 ,,	93.0 ,,
4. Total sectional area (1+3) ..	599.73 ,,	543.4 ,,	397.26 ,,
5. Total load supported	215.63 tons.	181.1 tons.	146.65 tons.
6. Compressive str ss per sq: in. (5.4)	0.36 ,,	0.337 ,,	0.37 ,,

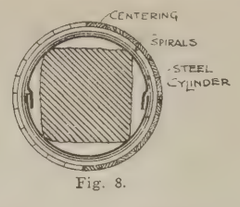

Fig. 8.

Fig. 9.

Fig. 10.

The ratio of these stresses to the stress of 0.285 tons admitted for concrete unreinforced laterally is :—

(6 : 0.285 tons)	1.26	1.18	1.30

This is to say, spiralling must increase the resistance of concrete by :—

	26%	18%	30%

Dividing these figures by the coefficient of efficiency of spiralling, which, according to the regulations laid down by the French Minister of Public Works, is 32, we have :—

Percentage of spirals required	0.8	0.6	1
,, ,, ,,	1.5	1.3	1.5

The increase in the dimensions of the columns causes an increase of the coefficient of efficiency of the longitudinal armouring.

Carrying out the Work.

As the columns are interrupted by the floors, the spirals could only be wound directly round the columns. For this purpose, after chipping the surface of the column, a steel cylinder, consisting of two halves clamped together *in situ*, was put around it. On this cylinder spirals of about $\frac{3}{8}$in. diameter rods were wound (Fig. 8).

After removal of the cylinder, the longitudinal bars completing the meshwork were inserted, the centering was placed, and the column was concreted in.

In such a case as the present it is impossible to adopt the usual method of connecting two consecutive pieces of spiral by bending their ends to the centre of the column (Fig. 9); therefore the continuity of the spiralling was ensured by winding the ends around the existing column, in which they were anchored by hooks penetrating from $1\frac{1}{2}$ to 2 ins. (Fig. 10).

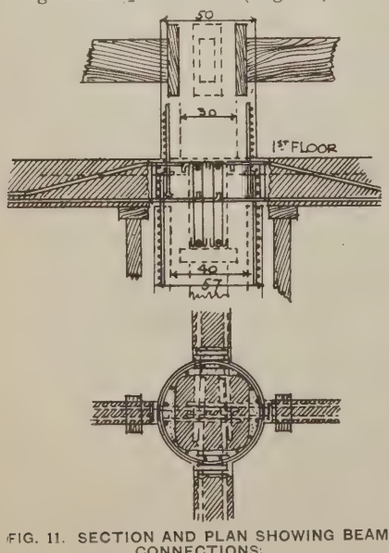

FIG. 11. SECTION AND PLAN SHOWING BEAM CONNECTIONS.

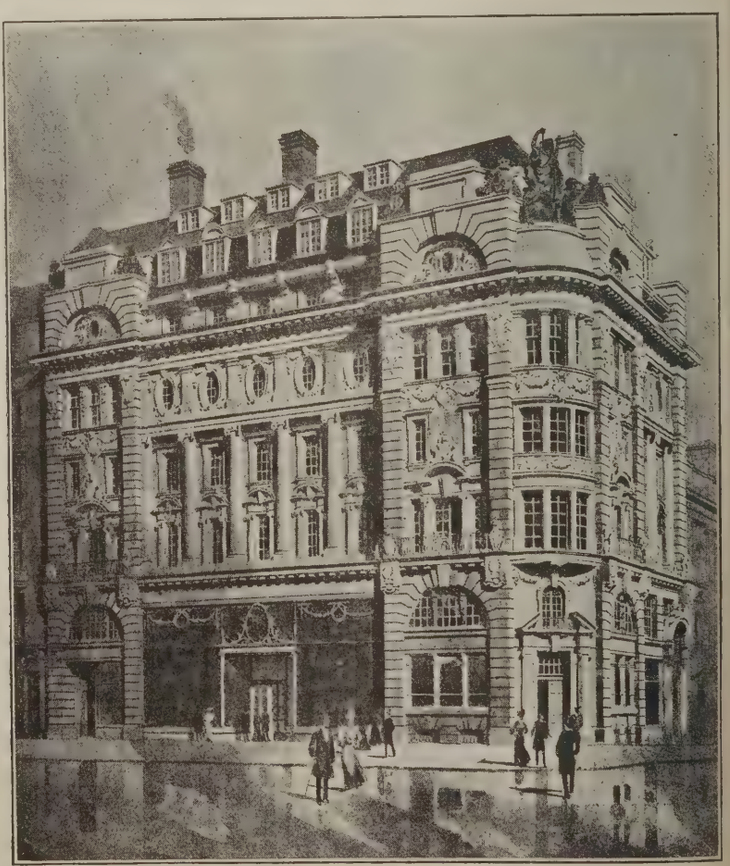
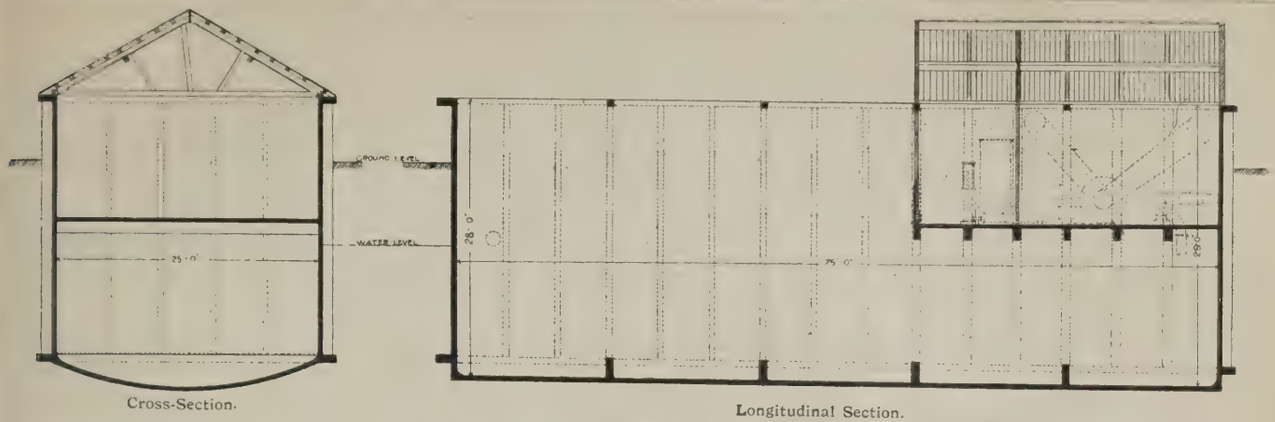


The reinforcement was carried through the floors as follows :—After having carefully propped up the girders, a circular hole was made through the concrete of the floor around each column, the diameter of the hole slightly exceeding that of the reinforcement (Fig. 11). The spirals were then introduced through the reinforcing of the girders, and the hole was then concreted in. The propping of the floors considerably reduced the load acting on the existing columns during their strengthening. 4 to 1 concrete was used.

A PAMPHLET ON REINFORCED CONCRETE.



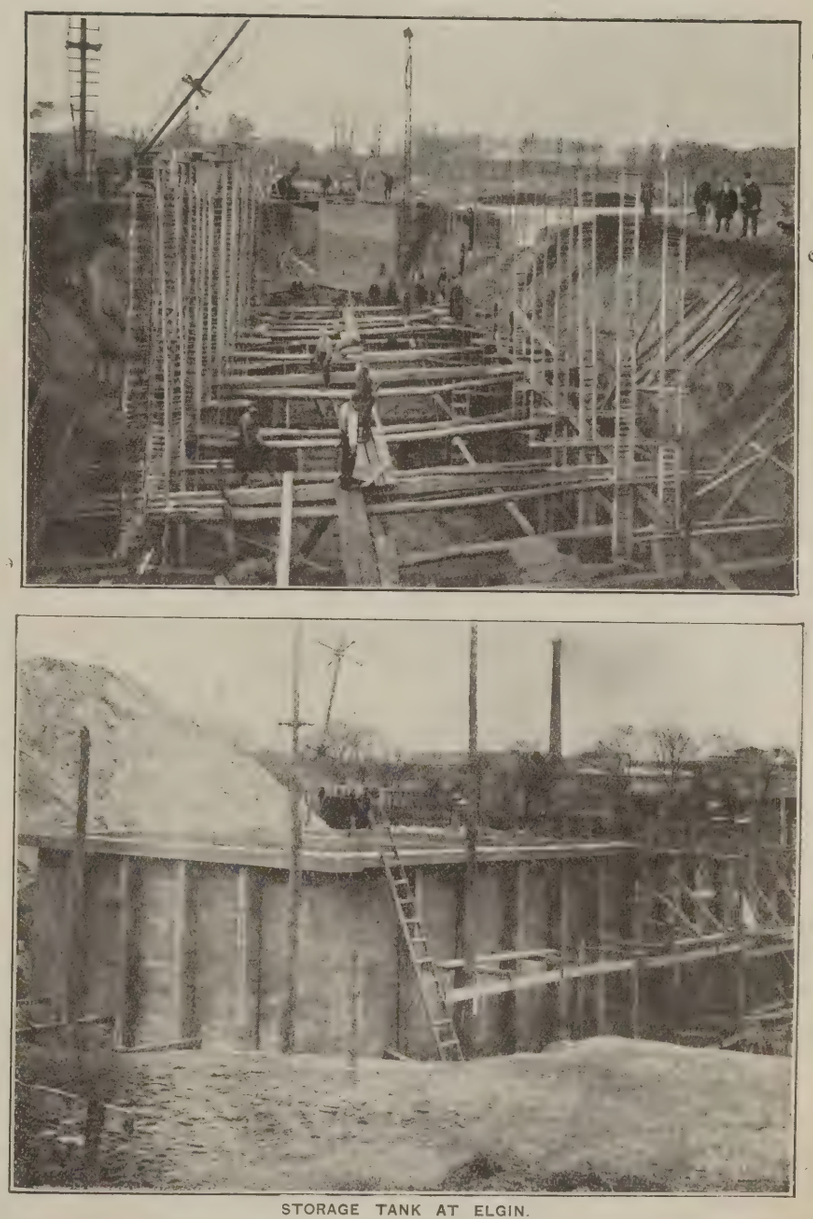
We have received an interesting pamphlet from Messrs. D. G. Somerville and Co., the specialist engineers and contractors of 72, Victoria Street, London, S.W., showing examples of recent works executed by them in reinforced concrete and structural steelwork. These works include the following : The Town Quay, Southampton; St. Charles' College Chapel, Notting Hill; Messrs. Carwardine's premises in Kingsland Road, London; the covering-over of the District Railway between St. James's Park and Victoria Stations; the National Telephone Co.'s new premises at Paddington; Messrs. Saunders's premises in Berners Street; Norwich Union Insurance Buildings, Piccadilly, W.; Messrs. Edison and Swan's works at Ponders End; and Messrs. McVitie and Price's new works. The illustrations are well reproduced, and the pamphlet should be kept by engineers as a useful record of actual work ca out. Messrs. Somerville and Co. made a special study of reinforced crete, and they have had a great de practical experience. They keep a of expert engineers, superintendents, trained workmen, and have an elab and extensive plant.

New contracts for reinforced con and structural steelwork which have secured by Messrs. Somerville are follows :—Large residence at West Co further extension to Ediswan wo galleries and floors for Electric L Co., London; Anglo-South-Ame Bank, Old Broad Street, Lon National Telephone premises, Deptf

MESSRS. EDWIN J. PEARCE AND CO. inforced concrete specialists, of De M fort Chambers, Horsefair Street, Le ter, have contracts in hand at presen the construction of fire-resisting floors strong-room in reinforced concrete new bank at Beeston, as well as fir sisting floors at the new County Sch Leicester. They have also executed following contracts : — Fire-resi floors at the Co-operative Bakery, Eaton, and at new hunting-box, Scalf stables at Rempstone and Derby; w block floors at Council schools at D Melton and Bagworth, and at a new at Long Eaton; artificial stone and yards of Granolithic paving at new factory, Coventry; fireproof staircases landings at Bulwell; farm buildings, geries, etc., at Scarlton Scroop.

NEW BUILDING FOR THE NORWICH UNION LIFE INSURANCE CO. NOW BEING COMPL AT THE CORNER OF ST. JAMES'S STREET AND PICCADILLY, LONDON. ERNEST RUNTZ AND FORD, FF.R.I.B.A, ARCHITECTS.

The reinforced concrete floors and roofs of this building, and the fireproofing of the steelwork, w executed by Messrs. D. G. Somerville & Co.



Cross-Section.

Longitudinal Section.

A STORAGE TANK AT ELGIN.

We illustrate herewith a storage tank in reinforced concrete on the Coignet system which has been constructed for the Burgh of Elgin, under the direct supervision of the burgh engineer, Mr. Acton A. Turiff. The contractor and licensee for the Coignet system was Mr. James Newlands, of Elgin. Owing to the treacherous nature of the ground, which is composed of sand to a great depth, and also on account of the under-pressure of water, it was thought advisable to adopt reinforced concrete for this work instead of ordinary heavy masonry. It will be noticed that the bottom of the tank is in the shape of an inverted arch, in order to resist any under-pressure of water. The general dimensions of the work are—length 75ft., width 25ft., height about 28ft. A floor has also been constructed inside the tank in order to carry gas engines and pumps. The tank is covered with an ordinary wooden gable roof. Several hundred feet of channelling have also been erected in connection with this work. The section of the channel is 30ins. by 30ins.

STORAGE TANK AT ELGIN.

TESTS ON CONCRETE CUBES.

As addenda to the paper on "Concrete and Reinforced Concrete" published in our last "Concrete and Steel Section," Mr. E. P. Wells gives the following interesting record of tests made with cubes of concrete :—

The concrete was made in the proportion of 5 to 1, namely, Spurn gravel $\frac{3}{4}$ to $\frac{1}{8}$, 3 parts; Spurn sand, $\frac{1}{8}$ down, 2 parts; cement (made by Messrs. G. and T. Earle, Ltd), of Wilmington, Hull, known as "pure rotary") 1 part. The amount of water used was 7 per cent.

The cubes were made 6ins. by 6ins., and in all cases were in a series of three; therefore the crushing strengths given are averages, and do not by any means represent the highest in either case.

The series kept in air and under normal conditions crushed at the various periods, the results being in tons per sq. ft. : seven days, 196 tons; one month, 312 tons; three months, 364 tons; six months, 456 tons; and twelve months, 479 tons.

The other tests, which are regarded as standard—that is, kept in water—gave the following results : At the periods of seven days, 226 tons; one month, 416 tons; three months, 528 tons; six months, 604 tons; and twelve months, 612 tons per sq. ft., or 9,520 lbs. per sq. in.

With reference to the twelve months' test, the following are the results of the three cubes : 584, 620, 632, or an average of 612 tons per sq. ft. With regard to the twelve months' tests of concrete kept in air, the highest result was 500 tons, so that, practically speaking, the highest when in air is, roughly, 20 per cent. less. I have no doubt in my mind that the air tests will eventually come up to the concrete when kept in water, but it will take a long period before this happens.

When the cubes were made, 1½in. briquettes from the same gauging were also made to see whether there was any ratio between the crushing and tensile, but, owing to the nature of the gravel, it was very difficult to get the tensile test of any value by reason of the presence of, in some cases, a large pebble on the outside face of the briquette. Still, the following may be of interest :—Air tests : seven days, 189 per sq. in.; one month,

265; three months, 317; six months, 405; and twelve months, 375.

The tests in water over the same periods were: 287, 431, 429, 435, and 390.

In my experience, I have found that the only reliable method of obtaining a fair average tensile test is to make them in series of twenty, as, in the case of three briquettes one low one completely capsizes the average, and this was particularly noticeable in the twelve months tests, because two of the briquettes, in both the air and the water tests, gave considerably higher results than any that were obtained at six months.

The best tests will clearly show you how valueless the tensile tests are, and that to find out the true value of concrete one must adhere to compression tests only.

THE MANHATTAN BRIDGE, NEW YORK.

The new Manhattan Bridge, New York, now being constructed, is a cable suspension bridge, designed to bear an enormous load—it is claimed, in fact, to be the heaviest bridge in the world.

The bridge will have a river span 1,470 ft. in length from centre to centre of the towers, and two side spans each 725 ft. long connecting with the anchorages. The latter are built exceptionally strong in order to withstand the heavy pull of the cables, which is put at 30,000 tons. The four towers are 280 ft. high, and are reared upon cast-steel pedestals, 42ft. long, 22ft. wide, and 6ft. high, which rest upon granite and concrete piers. The bridge will rise 135 ft. above mean high-water, it will have a width of 120 ft., and will be two-decked. Each floor will carry four railway tracks, and the lower floor, in addition, a wide roadway and foot-paths, the latter borne on cantilever extensions of the floor beams projecting from the outer trusses. The weight of the steel used, including anchor chains, cables and suspended span is 42,000 tons. Each tower is calculated to bear a maximum load of 32,000 tons, estimating the extreme possible congestion of the bridge, with the tracks lined with full cars and the roadway and footpaths crowded with vehicles and pedestrians, at 8 tons per linear foot. The average working load which the bridge is designed to bear is put at half, or 4 tons to the linear foot.

The four main cables from which the superstructure is to be suspended will be composed of 9,472 galvanized steel wires of 3-16in. diameter, woven into 37 strands, giving the completed cable a diameter of 21¼ ins. The cost of the cable work alone is placed at over £300,000.

The superstructures, forming the two floors of the bridge, will be hung from the main cables by means of vertical suspender cables, and will consist of four trusses, each 24ft. deep from centre to centre of chords, carried through planes in the lower parts of the towers and extending the entire length of the bridge. The upper truss chord will be fixed nearly 24 ft. above the lower, and both will be connected every 18 ft. by vertical braces. The trusses weigh 18,500 tons, and are to be tested to withstand a working stress of 40,000 lbs. to the sq. in. Nickel steel, as well as carbon steel, has been largely used in their erection.

The final cost of the bridge, including the land for the long approaches, is placed at between £4,000,000 and £4,400,000. It is expected to be completed by December, 1909.—(From the "Times.")

THE WATERTIGHTNESS OF CONCRETE.*

Some American Tests.

By Sanford E. Thompson, M.Am.Soc.C.E.

These permeability tests were made to determine the effect of adding various percentages of hydrated lime to concrete of different proportions. The specimens were similar in a general way to those designed by the writer for previous tests, as described in the "Proceedings" of the American Society for Testing Materials, Vol. VI., p. 373, but were of much larger size; in fact, they were considerably larger than have hitherto been customary in permeability tests. The blocks of concrete were 20 ins. in diameter by 16 ins. thick, and the water was introduced into the centre of the block through a pipe.

The proportions of concrete selected were those which are customarily used in concrete construction, except that a slight excess of sand was taken in proportion to the stone, to ensure homogeneous specimens, thus avoiding the possibility of stone pockets, which are more liable to occur in small-size specimens than in practical construction.

The materials, which are more fully described later in the paper, are quite representative, so that the results obtained are applicable to usual conditions in construction work. The cement was Lehigh brand; the crushed stone was conglomerate rock, which resembles trap in its characteristics and tests; the sand was a good coarse bank sand. The hydrated lime was Pine Cone brand made by the Rockland-Rockport Lime Co.

The percentages of hydrated lime to add were selected after a careful study of the materials and the proportions, the plan being to use larger percentages of lime with the leaner concrete mixtures because these contained more voids to be filled. The proportions of concrete and the percentages of lime selected by this preliminary study were as follows:

Proportions of concrete.	Hydrated lime.	Proportions of concrete.	Hydrated lime.	Proportions of concrete.	Hydrated lime.
1 : 2 : 4	0	1 : 2½ : 4½	0	1 : 3 : 5	0
,,	4%	,,	6%	,,	8%
,,	7%	,,	10%	,,	14%
,,	10%	,,	14%	,,	20%

Conclusions.

The following conclusions are drawn as the result of the experiments:

1. Hydrated lime increases the watertightness of concrete.

2. Effective proportions of hydrated lime for water-tight concrete are as follows:

Portland cement.	Sand.	Stone.	Hyd. lime.
1 part	2 parts	4 parts	8%
1 ,,	2½ ,,	4½ ,,	12%
1 ,,	3 ,,	5 ,,	16%

These percentages are based on the weight of the dry hydrated lime to the weight of the dry Portland cement.

3. The cost of large waterproof concrete structures frequently may be reduced by employing leaner proportions with hydrated lime admixtures, and small structures, such as tanks, may be made more watertight.

4. Lime paste made from a given weight of hydrated lime occupied about 2¼ times the bulk of paste made from the same weight of Portland cement, and is therefore very efficient in void filling.

Although the character of the sand and stone used in the concrete will affect the best percentage of lime to use, the present materials are representive of average materials throughout the United States, so that the results should be of general application. Coarser sand would naturall require slightly larger percentages c lime, and finer sand, that is, sand havin a larger percentage of fine grains whic pass a sieve with 40 meshes to the linea inch, would be apt to require less lime since sands containing considerable fin material produce more watertight a though a weaker concrete.

A study of the curves which are give later in the paper suggests that for coarse sands than used in the experiments, or i cases where the water pressure must b applied in one month or less after laying the percentages given above may be in creased by about 25 per cent., while fo many classes of work 25 per cent. les than the above percentages will be sati factory.

For mortar in proportions correspon ing to the cement and sand in the diffe ent concretes, the same percentage hydrated lime would naturally be sele ted: thus 1 : 2 mortar corresponds to 1 2 : 4 concrete, 1 : 2½ mortar to 1 : 2½ 4½ concrete, 1 : 3 mortar to 1 ; 3 : 5 co crete.

Increasing the proportions of stone t say, 1 : 2 : 4½, 1 : 2½ : 5, or 1 : 3 : 5½, shou have no effect on the percentage hydrated lime to be selected, but f watertight concrete it is always advisab to have a slight excess of mortar to avo stone pockets.

Fig. 1 (see next page) shows grap cally the effect of the hydrated lime the watertightness of the concrete.

Fig. 2 shows a section of the mouldin box in which the specimen blocks we made. Instead of using a wooden moul the sides were formed by two pieces wrought iron bent to half-circles a bolted together. These rested on a pla platform to form the bottom of the mou until the concrete had set. The ceme and hydrated lime were first thorough mixed to give a uniform colour, then t sand was added and mixed dry. T stone was finally added and suffici water used to make a soft, mushy m such as would be adopted in constructi

Since previous tests by the wri showed that the top of a block as mould is much more watertight than the botto because of te fine material which ri to the surface, the specimens were ma in an inverted position, so that Fig shows the specimen upside down wh compared with its position in the perm ability test. The iron pipe fittings w so placed as to give a thickness of 8 i of concrete in all directions, and a s face for the water to strike against of sq. ins.—that is, a circle of 4 ins. d meter. The concrete in each specim weighed over 400 lbs.

Proportioning the Hydrated Lime.

Few tests have been made to determ the effect of the introduction of spec materials into concrete to increase watertightness. The percentages hydrated lime to use were determined applying the conclusions derived fr tests with graded concrete aggregates a the results of the tests indicate that m chanical analysis methods can be appl to the laying out of permeability tests

For the 1 : 2 : 4 proportions the perce ages of hydrated lime were selected p tially by judgment. From previous te by the writer, 2 per cent. of hydra lime had been found to increase the wat tightness of 1 : 2 : 4 concrete made w sand and gravel, and 4 per cent. of li to still further increase it. The minim percentage was therefore selected a per cent., and the maximum percent

*Summary of a paper read before the American Society for Testing Materials.

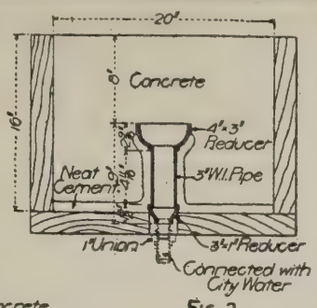

FIG. 2

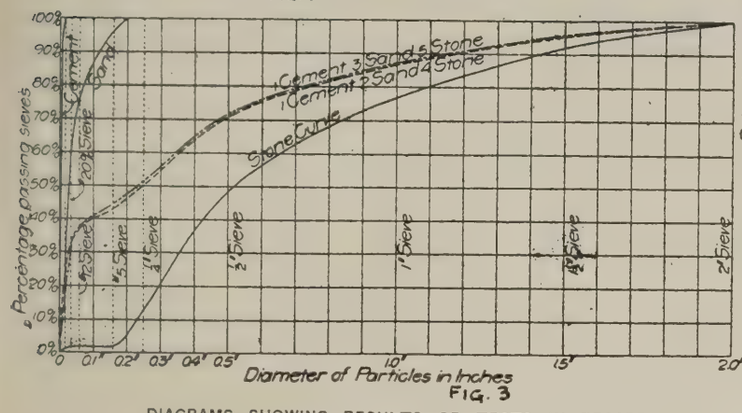

FIG. 3

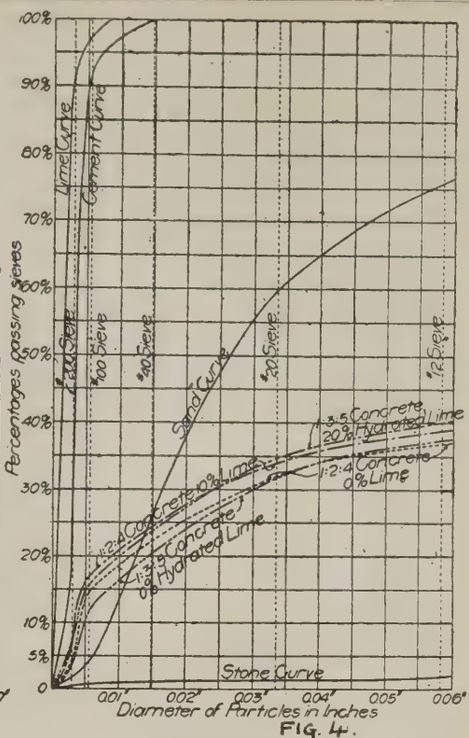

FIG. 4.

DIAGRAMS SHOWING RESULTS OF TESTS IN REGARD TO THE WATERTIGHTNESS OF CONCRETE.

r the 1 :2 :4 mix was taken as 10 per nt., so as to confine the results to com- ratively narrow limits. One intermedi- e percentage was also chosen, thus giv- ig 0, 4, 7, and 10 per cent. for the 2 :4 concrete.

Leaner concrete mixtures evidently re- dire more fine material for watertight- ss, because there are more and larger ids. Furthermore, tests in general in- cate that with a lean mix we can add ich more fine material without reducing e strength, and that this addition up a certain limit is beneficial not only r watertightness but also for strength.

For selecting percentages of lime for e 1 :2½ :4½ and the 1 :3 :5 concrete, hich would compare with the percent- ges selected for the 1 :2 :4, methods of chanical analysis were employed, the ject being to obtain mixtures for each these other proportions which would ve substantially the same sizes of par- les. In Fig. 3 the mechanical analy- s of the cement, sand and stone are otted, and a combination curve of these ree materials made for 1 :2 :4 and 1 :3 :5 concrete. The combined curves e simply the mechanical analyses of the xture of the three dry materials in the ven proportions.

Plotting the Curves.

The curves of the individual materials dicate the percentages passing the ves of various sizes. For example, cing the curve for the broken stone, hich is the lower curve, all the stone, 100 per cent., passes a sieve 2 ins. in ameter, 92 per cent. passes a 1½-in. ve, 76.5 per cent. a 1-in. sieve, and so The sand and cement curves are otted in a similar fashion.

Having plotted these individual curves, is possible to calculate the percentages l to plot combined curves showing mix- es of these three materials in any given portions.

The making of these combined curves quite simple. Thus, for example, to d the point on the 1 :2 :4 curve where it cuts the ordinate corresponding to the No. 12 sieve, the sums of the percentages of the individual materials at this same ordinate are taken in the proportions which they bear to the concrete mixture. All the cement is finer than the No. 12 sieve, and since the cement is one part of the seven parts in the mixture, one-seventh of 100 per cent. represents the percentage of cement in the mixture at the given ordinate. Similarly, since there are two parts of sand in the seven parts, the sand percentage at the No. 12 ordinate, 76 per cent., is multiplied by two-sevenths, and the stone percentage, 1.8 per cent., by four-sevenths, thus giving as the point on the No. 12 sieve ordinate in the combined curve :

1/7 × 100 per cent. = 14.3 per cent. = cement
2/7 × 76 per cent. = 21.7 per cent. = sand
4/7 × 1.8 per cent. = 1.0 per cent. = stone

37.0 per cent. = 1 :2 :4 mix

The other points in the curves are found in a similar manner.

Permeability depends more upon the gradation of the fine particles than of the coarse, and the finer material, that is, the left-hand portions of the curves, is therefore replotted in Fig. 4 to larger scale. Referring to the curves for 1 :2 :4 and 1 :3 :5 proportions, we notice that they are quite similar above, that is, to the right, of the No. 20 sieve, and that the greatest proportionate difference between them is below the No. 40 sieve. We may assume, therefore, that the particles lying below the No. 40 sieve are those which chiefly affect the watertightness. Therefore, the finer sieves, No. 100 and No. 200, must be chiefly used in studying the percentages of lime to add.

Several percentages were tried, and it was found that to make the 1 :3 :5 curve most nearly similar to the 1 :2 :4 concrete, 10 per cent. of lime must be added to the 1 :3 :5 mix. The curves of these two mixtures, together with the curves of concrete with no lime, are shown in Fig. 4. The other proportions were also plotted in the same way, but are omitted in the diagram for the sake of clearness.

Practice to be followed for Watertight Concrete.

A paper on permeability is incomplete without reference to the general principles of construction which must be followed to produce a watertight concrete. The concrete materials may be perfectly graded and the proper proportions of cement and of hydrated lime used, and then if the concrete is poorly mixed, mixed with insufficient water, or improperly placed, or if joints are left in the mass, the wall will invariably leak.

In the first place, the mixture must be thorough, and in the second place, sufficient water must be employed to give at least a "mushy" mix, so that it will settle into place with only a small amount of ramming.

Fully as important as the mixture is the bonding of the concrete between two days' work. For a small structure which must be watertight, it is advisable to place the concrete continuously, allowing no joint whatever, and not even permitting the concrete to stiffen up between the batches. Even an interruption of an hour in the middle of a hot day has been known to form a joint which will allow water to pass. If continuous work is impracticable, the old surface of the concrete must be thoroughly cleaned of all dirt and laitance or partially set cement, so as to expose the concrete. A layer of neat cement paste of soft consistency, or else of 1 :1 mortar, should be then spread upon the old concrete after thoroughly wetting it, and the new concrete laid before this mortar has stiffened.

The placing of the mortar or paste, however, does not preclude the necessity of thoroughly cleaning the surface, for if any of the laitance or partially set cement is left on the old concrete, it will form a joint under the new mortar through which water will pass.

A long wall or a conduit may require longitudinal reinforcement to prevent temperature cracks, and therefore leakage through them.

The Concrete Institute.

Much pleasure has been expressed amongst those interested in concrete and reinforced concrete that the fourth vice-presidency of the Concrete Institute has been accepted by Sir Douglas Fox, J.P., past-president of the Institution of Civil Engineers. The other vice-presidents, it will be remembered, are Sir Henry Tanner, Sir William Preece, and Sir William Mather. The membership of the Institute already exceeds 200. We understand that the first full council meeting is taking place next week, under the presidency of the Earl of Plymouth (formerly First Commissioner of Works), so that general meetings, presentations of papers, and discussions may be expected to start in the early autumn. An interesting fact in connection with this Institute is that a large number of its members are either members or associates of the Institution of Civil Engineers.

MR. H. TILLSTONE has been appointed borough surveyor of Brighton in succession to Mr. Alfred Weller, deceased.

A REINFORCED CONCRETE BRIDGE.—Messrs. D. G. Somerville and Co., the well-known reinforced concrete engineers of Westminster, have secured the contract for the construction of Peckelden Bridge, Chilham, Kent, in reinforced concrete, for the East Ashford Rural District Council, the system of reinforcing being with the Kahn Trussed Bar. The engineer to the work is Mr. H. P. Maybury, county surveyor and engineer to the Council.

THE DRIVING OF FERRO-CONCRETE PILES.—During the construction of the large jetty now in course of completion in Swansea Harbour under the superintendence of Messrs. C. S. and W. P. Meik, a large number of Hennebique reinforced concrete piles, 14 ins. square, have been driven by means of a 50 cwt. monkey falling from the height of 10 ft. With a monkey of this weight and exceptionally high drop, each blow represents the force of 56,000 ft.-lbs., which testifies to the good design of the piles. The concrete was mixed in the proportions of one part Portland cement to 4 parts of granite chips, suitably graded, and cubes of the material when tested at the age of two months were found to possess the ultimate compressive strength of 4,000 lbs. per sq. in.

A NEW AUTOMATIC ELECTRIC PASSENGER LIFT has been installed by Messrs. Archibald Smith and Stevens, of Battersea, at the new building which has been erected for the National Pension Fund for Nurses in Buckingham Street. The lift was used by the King and Queen at the recent opening ceremony. In the cage are button pushes corresponding to the floors served. Momentary pressure of any button will send the cage to the corresponding floor, where it stops automatically, while the lift can also be brought to any floor by pressing a button on the landing, provided that it is not already in use by another passenger, because when the lift is in use all the controlling buttons are dead, and no door can be unlocked or opened unless the cage is standing opposite that particular door. Eight lifts of this type have recently been erected by Messrs. Archibald Smith and Stevens at the new "Morning Post" building.

New London Buildings.

The following were among the applications under the London Building Act, 1894, that came before the London County Council at their meeting yesterday. Consent or refusal, as recommended by the Building Act Committee, is indicated in italics in each case:—

Erection of buildings on the eastern side of Stamford Hill, Hackney, to abut also upon the southern side of Upper Clapton Road, on the further application of Mr. H. C. Webster, on behalf of Lady William Cecil (*consent*).

Erection of an iron and glass covered way in front of No. 81, Finchley Road, Hampstead, on the application of Messrs. W. Densham and Sons, on behalf of Mr. J. Stockford (*consent*).

Conversion of an existing bay-window into a shop front at No. 8, Kennington Park Road, Kennington, on the application of Mr. E. H. Payne, on behalf of Messrs. A. Beattie and Co. (*consent*).

Erection of an iron and glass covered way in front of No. 17 Bolton Gardens, Kensington, on the application of Messrs. H. G. Lancaster and Co., on behalf of Mr. O. Langenbach. The Council will be prepared to consider an amended application accompanied by a plan showing the sides of the covered way unenclosed and also showing it to be set back to the entrance steps so as to be in line with the covered ways at Nos. 19 and 20, Bolton Gardens (*refusal*).

Erection of an iron and glass shelter in front of the premises of the Civil Service Co-operative Supply, Limited, No. 28, Haymarket, Strand, on the application of Mr. F. T. Verity, on behalf of the Directors of the Society. It is not the practice of the Council to permit the erection of shelters at premises used for the purpose for which the building in question is intended (*refusal*).

Erection of a shop front at No. 161, Brompton Road, Kensington, to abut also upon Lloyd's Place, on the application of Messrs. Stanley Jones and Co. (*consent*).

Erection of a one-storey addition at the rear of No. 17, Kensington Square, Kensington, at less than the prescribed distance from the centre of the roadway of South-end, on the application of Messrs. J. Poole and Son, on behalf of Sir C. Hubert Parry (*consent*).

Erection of an addition at the rear of No. 27, Victoria Road, Kensington, at less than the prescribed distance from the centre of the roadway of Canning Passage, on the application of Messrs. W. Wise and Son, on behalf of Lieut.-Col. Cottell (*consent*).

Erection of a one-storey addition at the rear of No. 75, Whitechapel Road, Whitechapel, at less than the prescribed distance from the centre of Black Lion Yard, on the application of Mr. W. G. Brown, on behalf of Mr. J. Carnever (*consent*).

Erection of a building at less than the prescribed distance from the centre of a roadway at the rear of Nos. 42, 44 and 46, Princes Road, Plumstead, on the application of Mr. J. E. Edward (*consent*).

Erection of a building to be used as a church room adjoining St. Stephen's Church, Hampstead, with a boundary wall at less than the prescribed distance from the centre of the footway leading from Haverstock Hill to Pond Street, on the application of Mr. E. A. Pearce, on behalf of the building committee of St. Stephen's Church room. The solicitor is to take such steps as may be necessary to protect the Council's interests (*refusal*).

Erection of a building on the eastern side of Christian Street, Commercial Road, St. George-in-the-East, southward of No. 10, and at less than the prescribed distance from the centre of the roadway of the street, on the application of Messrs. Mark King and Son, on behalf of Messrs. T. M. Fairclough and Sons. The Council is prepared to consider an amended application for permission to retain the forecourt boundary at less than the prescribed distance from the centre of the roadway of the street, during the pleasure of the Council, provided such application be accompanied by a plan showing the building as to be kept back 20 ft. from the centre of Christian Street (*refusal*).

Erection of a factory building on the north-western side of Somers Place, Norwood, on the application of Mr. R. Milnes, on behalf of the trustees of the Stockwell Orphanage (*consent*).

Erection of an addition at No. 22A, Praed Street, Paddington, with an irregular open space at the rear, on the application of Messrs. Thomas and Thomas, on behalf of Messrs. T. Holland and Son (*consent*).

Erection of buildings on the western side of Buckingham Palace Road, St. George, Hanover Square, northward of Eaton Lane, with an irregular open space at the rear, on the application of Mr. J. E. Trollope (*consent*).

Erection of an addition to the chapel at the rear of No. 127, Uxbridge Road, Hammersmith, on the application of Mr. C. M. Quilter, on behalf of the Rev. E. G. C. Parr (*consent*).

Erection of an oriel window and a balcony in front of buildings, to be erected upon the site of Nos. 9 and 10, Marble Arch, St. Marylebone, on the application of Mr. F. W. Foster (*consent*).

Erection of an electricity generating-station on the northern side of Narrow Street, Limehouse, on the application of Mr. M. W. Jameson, on behalf of the Stepney Borough Council (*consent*).

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 17. HUDDERSFIELD.—Erection of new lockrooms in Oakes Road, Lindley. Particulars from the architect as below. Tenders to be delivered not later than July 17 to J. Berry, Architect and surveyor, 3, Market Place, Huddersfield.

M Hulot's awings.

These magnificent drawings illustrating their author's conjectural restoration of the fortified of Selinus are now on view at the lly of the Royal Society of Painters ater Colours, and we advise those of aders who are interested in the sub- f architectural draughtsmanship to i themselves of the opportunity thus rd to inspect what are truly marvel- works of art. Prepared during the ed architect's tenure of the *Grand e Rome* the brilliancy of execu- isplayed in these drawings is little of wonderful, and whether the sub- elineated be represented by large- detail drawings, by exceedingly e and delicately rendered plans, by elevations, or by water-colour and perspective sketches, the impress of er-hand is always perceptible. Not- anding the vastness of the subject d by M. Hulot, his choice is a very one, as the old Sicilian town of s (which was conquered and de- l by the Carthaginians under Han- lin 409 B.C., then rebuilt as a city to the Carthaginians; and, finally, destroyed, never to be rebuilt, at se of the first Punic war) contains, dition to other remains of antiquity, ns of two groups of temples, situ- n the acropolis and the eastern hill city. All are completely ruined, e materials of each still remain in host perfect state of preservation, to the fact that the site has never ccupied since 250 B.C. The sculp- netopes from some of the temples long the most important examples ly Hellenic art, and the buildings lves, none of which are usually ered to be later than the 5th cen- .C., are of the greatest interest as nting the earliest known examples Doric style, and differing, in many nt details, from all other types. their archaic peculiarities are the iminution of the columns, the nar- atules over the metopes, and a cavetto, or necking, under the ypotrachelia. The great temple on the eastern hill of Selinus was rest peripteral temple of the whole c world, and was never quite com- although the whole of the main e was built. Among M. Hulot's gs there are various plans, eleva- d sections of the port and its forti- s, illustrating the existing remains e author's restorations among which is a beautifully executed bird's-eye view in pencil—in our opinion the finest drawing in the collection—of the city and acropolis. Other works of special interest include an immense tinted elevation of the south front of Selinus, and a very complete set of beautifully coloured and finished drawings of one of the temples (C) from the group on the acropolis, in which the author's restoration of its polychromatic ornamentation is very carefully rendered. M. Hulot also exhibits some charming examples of pictorial architecture, embodied in water-colour drawings of subjects from Palermo, the Chapelle Palatine and St. Clement's at Rome, and other buildings.

The Reconstruction of Victoria Station.

The recently-completed Victoria Station of the London, Brighton, and South-Coast Railway is a great improvement on its predecessor (constructed about fifty years ago), both in regard to the arrangements made for the convenience of passengers, and for those dealing solely with the traffic. The old station had a length of about 800ft., and a breadth of 230ft., whilst the new one (1,500ft. long and 320ft. wide) occupies an area of nearly 16 acres—an area about double that of the former station. Not only, however, has the capacity of the station itself been so enormously increased, but the means of access to it have also been greatly improved. Formerly the whole of the traffic, amounting sometimes to 700 trains (in and out) per day, had to be worked on two lines, one up and one down, but by widening Grosvenor Bridge the railway company has now been enabled to provide five lines as far as Battersea Park, beyond which there is a four-track road to Three Bridges. The existing façade to the station yard has been extended to the Grosvenor Hotel by a building (faced externally with red bricks and Portland stone, and containing 150 rooms) placed about 50ft. behind the line of frontage of the old station, to enable a covered area to be formed whereby passengers can be taken up and set down under shelter. The main line booking-hall (a spacious apartment 120ft. long and 70ft. wide, fitted with a booking-office enclosure containing 16 ticket issuing windows), the public waiting-rooms, and other offices are all placed under the hotel extension. An admirable feature of the new station appears in the arrangement made for the transit of passengers' luggage, which, instead of being wheeled in the ordinary way from the station entrances to the train, is conveyed by lifts to a series of subways adjoining the platforms, from which it is again raised, by other lifts, to the platform required. The comfort of the travelling public has been further considered and provided for by the erection of a large train indicator placed opposite the main booking hall. We understand that five of the platforms and three through lines are to be equipped and used in connection with the line, now in course of electrification, between Victoria and London Bridge.

An Old Strand Shop.

The *Daily Chronicle* regretfully records the fact that the old Georgian shop-front known as 107, Strand, which has been in the occupation of the family of its present tenants, Messrs. John Burgess and Son, for more than 130 years, is about to be demolished. The lease of the building, which is held direct from the Duchy of Lancaster, does not expire until 1914; but this interesting link with the past was bound to disappear sooner or later to provide space for the inevitable widening of the main artery between east and west. Many and varied have been the changes made in the Strand since the ancient shop with its collection of old-fashioned jugs and pots arranged behind the small window panes was first opened by the founder of the firm (one John Burgess, a Hampshire yeoman), and if only on this account the disappearance of another of the few remaining landmarks of an older and more interesting Strand will be deplored by all genuine lovers of our far too rapidly changing metropolis.

More Subways: An Architectural Opportunity.

The Paris Municipal Council's scheme for constructing subways at some of the more dangerous street crossings of their city is about to materialise. It has been decided to form immediately three subways—one in the Champs Elysées, another in front of the St. Lazare station, and a third at the junction of the Rue de Rivoli with the Boulevard de Sébastopol. Such facilities for the avoidance of accidents to foot-passengers are perhaps even more necessary in Paris than in London, the French driver being notoriously more reckless than the English, while the London policeman's masterly control of

traffic is admittedly inimitable. No details of the Paris scheme are yet to hand; and it remains to be seen whether the Paris Council will take advantage of an excellent opportunity of showing how, by enlisting the aid of the architect, and perhaps of the sculptor also, a street subway may be made to add to the æsthetic amenities as well as to the material convenience of a great city. Perhaps the underground passage itself is entirely hopeless from the architectural point of view, but there is no equally cogent reason why the approach to a subway should be no more than an unadorned hole in the ground. These approaches, obtruding themselves on the public gaze, and being more or less obstructive to those who do not desire to use them, ought to be made to offer "compensation and apology" by pleasing the eye to the full extent that the circumstances will allow. This principle has been hitherto neglected with respect to our own subways. Is it too late to urge it upon the attention of the promoters of the Blackfriars' subway?

BIRD'S-EYE VIEW OF THE FRANCO-BRITISH EXHIBITION.

BRITISH APPLIED ARTS PALACE: DETAIL OF WEST ENTRANCE.
JAMES B. FULTON, F.R.I.B.A., ARCHITECT. ALBERT E. HODGE, SCULPTOR.

SOME NOTES ON THE FRANCO-BRITISH EXHIBITI

As a piece of news, the Franco-B Exhibition at Shepherd's Bush is since stale, there having been such a to get the place opened (although a time it was nothing like finished), such a rush on the part of the daily to publish views of the buildings before the plasterers had finished work and before the grounds had bee out. As a matter of fact, however, only quite recently that the Exhi has been brought to what can be a finished condition, and even now is a considerable amount of work in gress, especially in connection with very large building—the Palace of rative Arts.

With exhibitions of all kinds this ness in bringing things to comp seems to have grown into a recog bad habit: it is always so, for exa with the building trades' exhibi Presumably, the reason is that the such a colossal amount of detail wo be done, and so many separate and firms to be dealt with, that it be impossible to keep everything up to which time, it must not be forgott always set as early as possible in to reduce the promoters' expenses d the preliminary days or weeks whe exhibition is in actual process of con tion, and to get as much out of the as soon and as often as is po Whether, in all cases, this is warran we are not prepared to say, but cert is that the Franco-British Exhibitio not in fit and proper order when the were first admitted in their thou Hence, we have been in no hurry t low the rushing lead of the daily but have taken time to survey the e tion at leisure, and when it can be as it ought to be seen.

The Plan.

The plan of the exhibition has widely circulated, and, we have no is familiar to most readers; hence not reproduce it here: at the same for the information of those who m have seen it, we may say that the p roughly, a long rectangle with the Stadium on one side, the ⊏-shape chinery halls on the other side, and end a semi-circular termination b by avenues radiating from a circus.

At the southern end of the rectar the "Court of Honour," comprising

group of buildings, in the Indian style, ranged around a lake which is spanned by numerous bridges. Then comes the Court of Arts, a very large square space, laid out with parterres, and having at the corners the palaces of British Applied Arts and French Applied Arts, the Palace of Women's Work, and the Palace of Music, with large buildings on either side devoted to the Decorative Arts and the Fine Arts. Next comes the Elite Gardens, with a great sunken band enclosures in the centre, parterres around, and the chief restaurants enclosing the whole. Between the Court of Arts and the Elite Gardens is a lake, spanned by a bridge, and from this was to have risen the Imperial Tower, 250ft. high. We understand, however, that some trouble occurred in regard to the foundations, and that the London County Council would not approve the erection of such a tower, though it is understood that this structure will be built after the close of the present exhibition (the impression is commonly abroad that all the buildings are to be pulled down after the close of the exhibition in October, but our information leads us to believe that nothing of the kind is contemplated, but that the place is to be treated as another Earl's Court—at least for next year). Shorn of the projected tower, this lake and bridge, with the stumpy-looking beginnings of the steelwork sticking up about 15ft., although masked with canvas painted over, is the most unsatisfactory feature of the exhibition, and, for all concerned, it is to be regretted that the tower could not be built as projected. The space beyond the Elite Gardens, which, as already explained, is laid out with radiating avenues from a central circus, is chiefly taken by the pavilions of the Colonies, Canada and Australia having erected especially large buildings.

CAFE PAILLARD. A. LEVARD, ARCHITECT.

The Architecture.

With this brief description of the general lay-out of the Exhibition, we may proceed to give a few notes on the buildings, considered from an architectural point of view. In taking count of such architecture we need to dissociate ourselves from the principles which bind us when considering architecture executed for the serious purposes of habitation or business. Exhibition architecture has a right to be what it likes, so long as it pleases the senses. Functional expression, logical construction, and all the shibboleths need have no place in its category. It can be riotous, unprecedented, profusely rich, and as irresponsible as a harlequinade. At the same time it cannot escape the consequences of such liberty. In the abstract it is easy to conceive buildings erected in that absolutely free manner, and, assuming that there is genius behind it all, the result might be superb from an exhibition point of view. In reality, however, we know that things are otherwise. We recall efforts of that kind at other exhibitions—for example, the Milan Exhibition—and we have the fact thrust upon us that while there is no imperative restraint imposed on the designer, the same fundamental qualities which go to make up great architecture in the actual world must be present in any exhibition architecture which is to be called great: that is to say, mass, proportion, outline, suitability to purpose, and, last of all, detail. In

BRITISH APPLIED ARTS PALACE: DETAIL OF SCULPTURE.

exhibition architecture, unfortunately, it is the last-named—detail—which generally dominates the whole, and the buildings in consequence are rococo, overladen with ornament, exuberant to the point of folly—an extreme only equalled by the "stately classic manner," such as we have seen at some of the exhibitions in the United States, where every building wore the frigid conventionality of official architecture.

At Shepherd's Bush there is no great architecture, but the English work is certainly better than the French, and of the English work we consider that the British Applied Arts Palace, by Mr. James B. Fulton, the French Applied Arts Palace, by Mr. Lionel G. Detmar, and the Palace of Decorative Arts, by Mr. John Belcher, A.R.A., occupy the front rank.

In the British Applied Arts Palace—rather a misnomer, surely, when the exhibits here, and in the French Applied Arts Palace, are solely gold and silversmiths' work, jewellery, and other work of a similar character—Mr. Fulton has been very successful in the placing of his plaster sculpture, especially in the case of the figures over the entrance facing the canal (see the view on page 54), and

A View showing Steel Framework. *Photos : Birkett.*

BRITISH APPLIED ARTS PALACE. JAMES B. FULTON, F.R.I.B.A., ARCHITECT.

there is a coherence about the lower part of the building which is extremely pleasing, the arcading, with its festoons, being particularly good. In many parts, however, a glut of sculpture dominates the work, and there is a crowding of features on the tower and turrets which is not commendable. The sculpture on the building has been executed from models by Mr. Albert Hodge.

Domes.

The Fine Arts building (the architect of which was M. Charles Martello) is chiefly notable for its three domes. Here, it is evident, no precedents or principles of serious architecture can apply, the forms of these domes being wholly foreign to such principles; yet the outlines are distinctly good, especially the two side domes, which are quite away from anything of the wedding-cake order; but, below, the rest of the building is wild and ineffectual, with a play of curved lines that cannot be justified, while the great cartouches which break up from the cornice line are wholly incongruous. In general outline, however, it must be admitted that these domes are more successful than Mr. Belcher's on the Decorative Arts building. The sculpture on this latter building is well placed, and the quadriga as a central feature against the colonnade curving out to the wing pavilions, is effective; but, on the ground level, the arcading is bleak and the order attenuated.

The Palace of Women's Work (M. Lucet, architect) and the Palace of Music (Charles Martello, architect) are both freaks of design, though there is about the tower of the latter building a sort of wild fancy held within some coherence of general outline which is pleasing in its novelty. With all their faults, however, these buildings do not reach the limit of fatuous trifling which characterises many others in the exhibition, such as we see in the exterior of the Grand Restaurant (M. Thorimbert, architect), the bandstands, and the main entrance to Uxbridge Road. By comparison, the Royal Pavilion (M. Edouard Crevel, architect) and the Café Paillard (M. Levard, architect) are eminently sane; indeed, each of these buildings, and specially the Royal Pavilion, presents many good points.

The Canadian and Australian pavilions are both efforts in the customary exhibition

manner: that is to say, they pretend to be serious work, and signally fail in gaining our admiration because of their mediocrity; while of the numerous other pavilions, we may say that they include nothing of any account architecturally. A pretentious building has been erected for the *Daily Mail*, which houses some magnificent printing machinery and plant, and secures what it was designed to secure, *i.e.*, prominence and an air of importance. It is not good architecture, but it is more inspiriting than the little building which Mr. Reginald Blomfield has designed for the *Daily Telegraph*—a sort of last remnant of the Renaissance which looks deadly quiet among its flaunting, sparkling, vulgar neighbours.

The Court of Honour.

The Court of Honour, with its Congress Hall occupying a central site at one end, is unquestionably the most effective part of the exhibition, particularly when illuminated at night; but as an architectural composition it does not call for extended notice, because it is purely a reproduction of Indian buildings, and though wonderful in its execution—as anyone will admit on examination of all the minute fretted and pierced work which embellishes it—is not an architectural creation. Still, taking as it is—a piece of outside stage scenery—this Court is a very effective composition. The scheme is attributed to Mr. Imre Kiralfy.

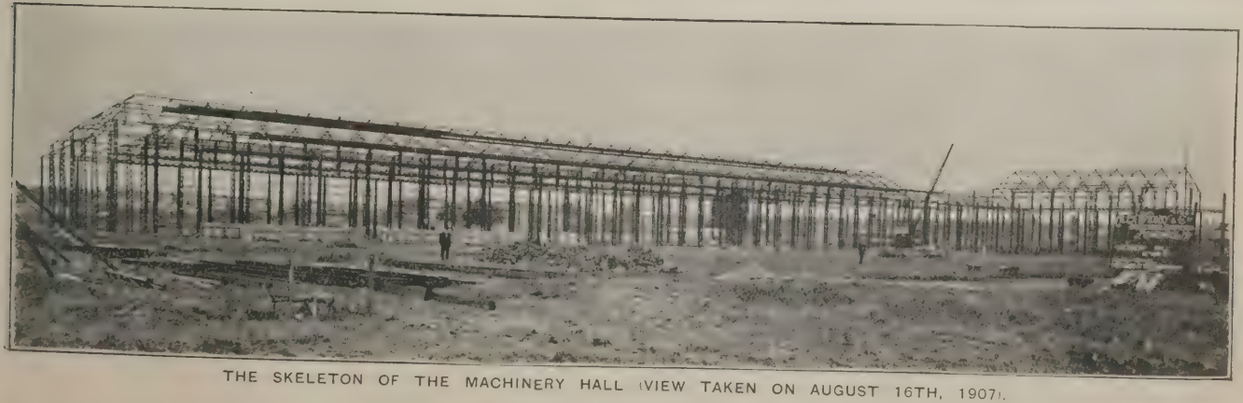
BIRD'S-EYE VIEW OF THE STADIUM.

Of the other buildings we may notice the great machinery halls, exceedingly impressive with their forest-like steelwork, though ill-clothed architecturally (M. Duquesne was the architect), and the Education building, which has been erected from designs by Mr. Charles Gascoyne.

Other buildings also to be noted are the Pavilion of the City of Paris (by M. Bouvard) and the Pavilion of the Comptoir National d'Escompte de Paris (of which Mr. Ambrose M. Poynter is the architect).

In one corner of the exhibition is the Irish village—an interesting group with a round tower as a landmark, which tower, it may be mentioned, was very rapidly built by means of Stacey's hand-power winches, which give a continuous supply of material.

The stadium has already been dealt with in our columns (see the issue for January 29th last), and we need not therefore repeat the particulars already given; though, as indicating the magnitude of the work, we would mention that the overall dimensions are 1,000ft. by 594ft., and that seating accommodation is provided for more than 70,000 spectators. It it a truly great work in steel and concrete. (The concrete work was executed by the Empire Stone Co., with "Indented" bars for reinforcement.)



It will be noticed that we have spoken only of the exteriors of the buildings. The reason is that there are practically no architectural interiors (one or two exceptions will be noted later). The galleries are all plain straightforward apartments, top-lighted through skylights, and hung below with muslin, by which means the light is diffused very pleasantly.

The Steel Skeletons.

Having now given some account of the outside clothing of the exhibition buildings, we may deal with their skeletons—which, in truth, constitute the actual construction, for the plaster is of course a mere shell; though no less than 1,800 tons of it have been used. All the large buildings have a steel framework, and it will readily be appreciated that a very considerable amount of material has been required: the total figure, in fact, is put at 75,000 tons. As a filling between the steelwork, breeze concrete has been used for the walls, either laid *in situ*, or in the form of slabs. A large amount of work of this kind has been executed by Messrs. Thos. J. Hawkins

VIEW LOOKING DOWN ONE ARM OF THE MACHINERY BUILDING BEFORE COMPLETION.

THE SKELETON OF THE MACHINERY HALL (VIEW TAKEN ON AUGUST 16TH, 1907).

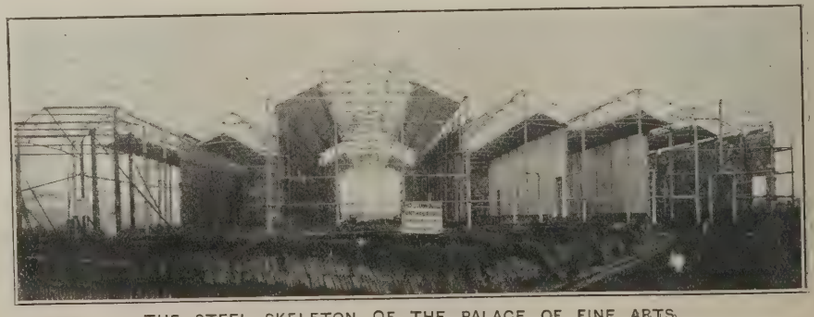
THE COURT OF HONOUR, IMRE KIRALFY, ARCHITECT.

and Co., of 109, Victoria Street, Westminster, who were employed to carry out the steel construction, concrete walling, flooring, etc., for many of the large buildings. The firm claim a big future for their "Hawko" concrete slab walls, and at the Exhibition they are able to point to excellent examples, for in several of the buildings their slabs have been carried up a height of 60ft., with steel reinforcement, the slabs being only 3ins. thick. The walls are built on concrete foundation walls. At intervals of 6ft. 8ins. the 3in. slabs are reinforced by light rolled steel joists, and by this means the load is transferred to the steel stanchions which support the roofs and which form the stiffening supports to the whole of the walls. Messrs. Hawkins claim that this method of construction, in addition to being fireproof and thoroughly durable, is the cheapest known form of walling.

Other firms which have carried out a great amount of constructional work at the exhibition are Messrs. Alex. Findlay and Co., Ltd., of Motherwell, and Messrs. Geo. Sands and Son, of Nottingham. Messrs. Findlay erected the huge machinery hall, which was designed by Mr. John J. Webster, M.I.C.E., of Westminster, and comprises two avenues each 661ft. by 130ft., connected by a block measuring 302ft. by 310ft. It is admirably lighted (on the "Eclipse" system of Messrs. Mellowes and Co., Ltd.), and houses a magnificent collection of machinery.

Messrs. Geo. Sands and Son erected the Australian, New Zealand, and other Colonial pavilions, as well as the main entrance to Uxbridge Road.

Messrs. Schweppes have erected a pavilion in open timber and plaster work, with old tiles on the roof, reproducing the shop in Bristol which was occupied in the eighteenth century by Jacob Schweppe, chymist, who first made soda water in 1787; and the Ardath Tobacco Co. have erected a pavilion comprising a miniature cigarette factory. Both these pavilions have been carried out by Messrs. Patman and Fotheringham, Ltd., from designs by Mr. H. W. Burton, architect, of 5, Bloomsbury Square, W.C.



The exterior illumination of the buildings is a very large undertaking, some idea of which can be gained when it is stated that on the Court of Honour alone there are no fewer than 15,000 lamps.

As an item of separate interest, it may be mentioned that the fencing around the lawns of the Education Building is the speciality of Messrs. James H. Tozer and Son, Ltd., of York Mansion, York Street, Westminster; it is known as "Lock-Woven" steel wire fencing, most ingeniously made, very stiff and strong, and adaptable for any height.

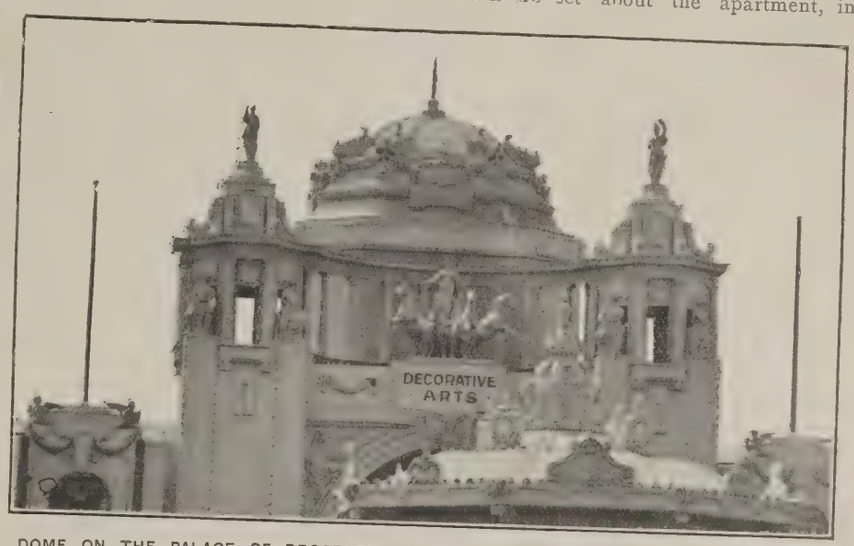
The Exhibits.

It is not our intention to particularise the innumerable exhibits at this great exhibition, because the majority of them do not concern us. We may, however, pick out the things in which an architect or a builder would be interested.

Without question, the finest exhibit is the magnificent collection of pictures and sculpture, representing the English and French schools, which is gathered together in the Fine Arts building—quite a great collection, intensely interesting, and very well displayed. The pictures are all easel pictures, and, consequently, have no relation to architecture *per se*; hence we pass them with this brief reference. The sculpture comes nearer to us, though here again, almost without exception, the exhibits stand by themselves as *objets d'art* rather than having any relation to the mother art of architecture. But among them is a large model of the Queen

THE STEEL SKELETON OF THE PALACE OF FINE ARTS.

DOME ON THE FINE ARTS PALACE. CHARLES MARTELLO, ARCHITECT.



ictoria Memorial now in course of com- etion in front of Buckingham Palace, ıd this, as the work of Sir Aston Webb ıd Mr. Brock, claims attention. The ıodel, we judge, gives a greater breadth effect than the finished work will have. masses up extremely well, the sculp- re groups placed at four points on the circling walls, as well as those on the ain pedestal, being excellent. It is ther the practice to speak of Mr. Brock's ork as that of a sculptor accomplished technique, and possessing an acade- cal slickness of manner (like Mr. Water- use in painting), but devoid of imagi- tion. Yet, looking at this model, one ıst admit the strength of its grouping ıd the pleasing sweep of its lines, and are only wishful that the actual memo- l will display the same qualities.

n the British section of the Fine Arts lace is a collection of architectural de- ins by the majority of our best-known n. The work shown is not new to us, ing been exhibited before at one time another, but there is one thing about which recalls a very much needed alter- on in the Architectural Room at the al Academy: that is to say, this col- ion at the Exhibition includes photo- graphs of executed work as well as draw- ings, and the value of such inclusion is at once apparent. It cannot be too often repeated that the architect's drawings are nothing in themselves, being merely a means to an end—the actual building—and it is therefore the more to be regretted that the Academy council should persist in their ridiculous and short-sighted policy of excluding photographs from the annual exhibition at Burlington House.

In the French section we are surprised to find that Architecture is not at all adequately represented. There are a few *projets* hung on the walls, and some specimens of those wonderful restorations to which French architects devote such excessive attention, the examples here shown including some reproductions of the great baths of Diocletian; there are also on the tables some books giving large photographic illustrations of the Sorbonne and the new Gare d'Orleans: but the architectural section of this exhibit is conspicuously weak.

In the Decorative Arts Building.

After the Fine Arts come the Decorative Arts. For the most part the exhibits in the Palace of Decorative Arts comprise furniture of all periods, both English and French. For example, Messrs. Hampton show a reproduction (two-thirds the original size) of the great hall at Hatfield, with numerous old specimens of English furniture set about the apartment, included among which are a Renaissance oak chest (date 1535), an oak table from Blenheim Palace, a Gothic sideboard table (lent by Mr. Ernest George), and several old chairs. The collection of old furniture is, indeed, a most instructive one.

DOME ON THE PALACE OF DECORATIVE ARTS. JOHN BELCHER, A.R.A., ARCHITECT.

DOME ON THE FINE ARTS PALACE. CHARLES MARTELLO. ARCHITECT.

A very effective exhibit is that of Messrs. Pilkington and Co., who have a scheme carried out in various kinds of tiles, including some beautiful reproductions of Persian tiles, with rich blue colouring, and many varieties of lustre tiles, these latter being especially well shown, used in conjunction with siena marble and pavonazzo, in the fireplace (designed by Mr. Edgar Wood) which forms a central feature.

Another good exhibit is that of Messrs. John Line and Sons. Their stand (designed by Mr. E. Hollyer Evans) is panelled around with deal stained a dark brown colour, with a well-designed fireplace in the centre, above which is a beautiful piece of mural painting by Mr. W. J. Neatby, R.M.S., who has been retained by the firm to execute work of this character. The painting is wonderfully

rich, yet subdued in character, and merits attention as work of high quality.

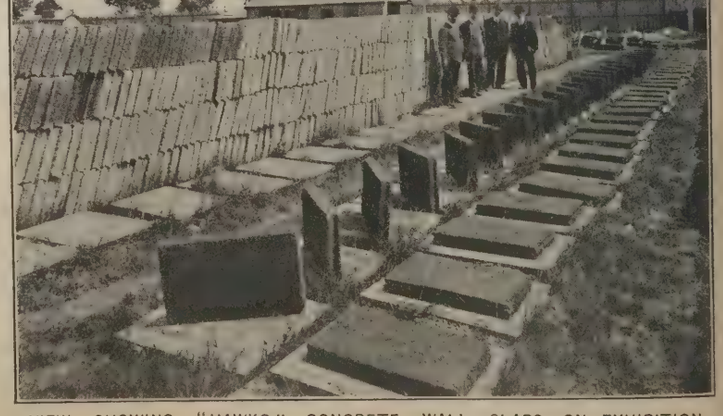
The Bromsgrove Guild have a delightful exhibit, chiefly of lead figures and vases for the garden. These are executed with the true artist's touch. They have a freedom which comes as a relief to those wearisome cast-iron stock-in-trade patterns which have hitherto filled manufacturers' catalogues; yet there is no exuberance about them. Behind all, we see that restraining hand which makes for the most beautiful work—not the hand of the academic dabbler, but of the worker who knows the limitations and the possibilities of his material. So, too, with the other leadwork shown, including a fine rain-water-head and downpipe; while another feature of interest is a wrought-iron gate embellished with flowers, not made out of sheet metal, but forged out of the solid, in the manner of the Dutch work introduced into England and Scotland by William III. The work of the Bromsgrove Guild is also to be seen elsewhere in the Exhibition, namely, in the Grand Restaurant, where they have executed some beautiful plasterwork to the walls and ceilings, and in the Imperial Sports Club, where they have done work of similar high quality. Readers will no doubt have noticed what a quantity of work for the most important buildings in the Kingdom is being secured by this guild of artists, and we learn now that they are going far afield to the East and to the Colonies, having established a London export office at Fenchurch House, 5, Fenchurch Street, E.C., in which connection it may be mentioned that one of their recently executed contracts was the whole of the stained glass for the new Church of the Messiah at Montreal.

Other exhibits in the Decorative Arts building include those of Messrs. Carron and Co., who show their well-known grates, modelled on 18th century designs; Messrs. H. C. Cleaver, Ltd., who have an interesting stand showing the application of their "Tudoresk" panelling (for the manufacture of which, as well as for architectural woodwork in general and exhibition stands in particular, Messrs. Cleaver have recently erected a new factory at Park Royal, equipped with the most modern machinery); the Brilliant Sign Co., of Gray's Inn Road, W.C., who have an exhibit of letters, fascias, etc.; and the London Warming and Ventilating Co., who show stoves and grates burning anthracite.

In the long winding gallery that leads to the Exhibition grounds from what is called the main entrance in Uxbridge Road—a decided mistake in the plan, because only a mere handful of the thousands who visit the exhibition ever go through this interminable gallery—is a collection of British pictorial photography, including many architectural subjects by Mr. Arthur Marshall, A.R.I.B.A., Mr. Frederick H. Evans, Mr. John H. Gear, and Mr. S. G. Kimber. In these galleries also are to be seen housing and garden-city exhibits (both English and French—the former including plans and photographs of Letchworth, the Hampstead Garden Suburb, and similar suburbs at Ealing, Manchester, Wolverhampton, and Birmingham), and exhibits of work done in the French elementary and secondary schools. There are also, among the trade exhibits, a particularly good stand showing "Shannon" office files, desks, and furniture (the Shannon Company also have, elsewhere in the Exhibiton, a very fine exhibit representing a bank

TOWER OF THE PALACE OF MUSIC. CHARLES MARTELLO, ARCHITECT.

interior); and an exhibit by Messrs. Ozonair, Ltd., who show their apparatus for purifying and sterilizing air by means of ozone—as now adopted in many important buildings.

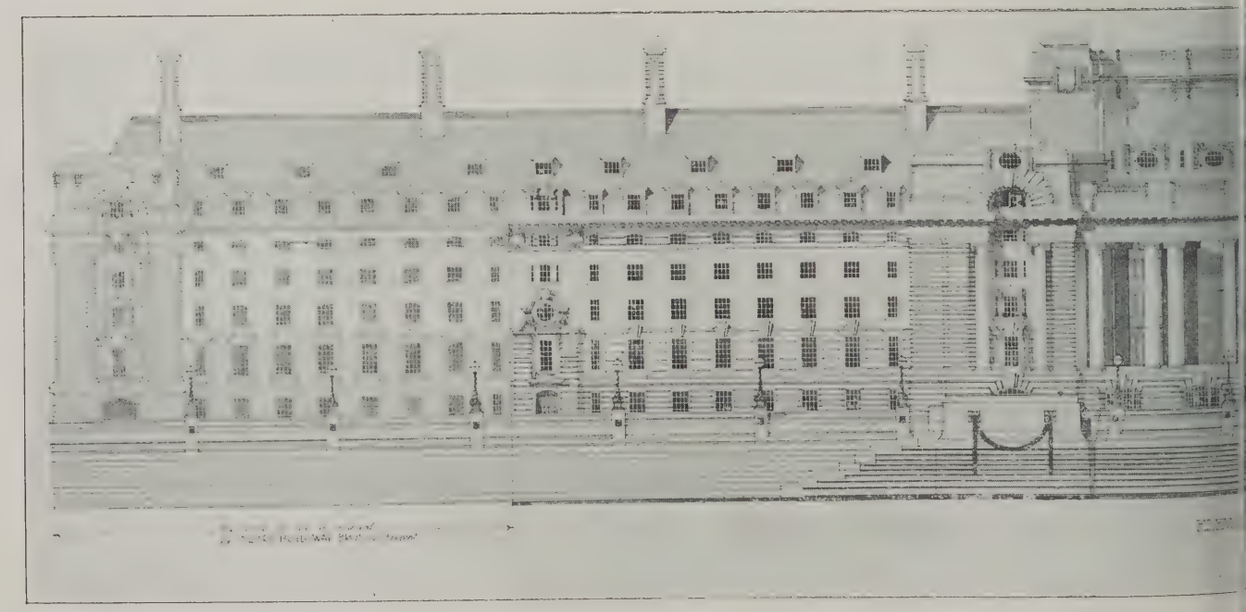


In the gallery adjoining the Court of Honour, on the east side, is a splendid collective exhibit of the Board of Education, the work shown having been sent from schools all over the Kingdom, and a very large model of Messrs. Debenham and Freebody's new building in Wigmore Street, the architects of which were Messrs. Russell and Wallace. On the other side of the Court of Honour, to the west, is the "English Garden"—with a foreground of grass and a background presenting open country, quite a remarkable piece of scene-painting on a colossal scale. Here, too, is a delightful old half-timber house—a genuine old Tudor house formerly at Ipswich—which Messrs. [illegible] and Reigate have re-erected to contain a most interesting display of furniture. Close by are the *Daily Mirror* cottage, a cottage constructed with "Frazzi" fire-resisting slabs.

Another interesting exhibit is the reproduction of "Old London" which has been devised and made by Mr. John B. Thorpe. The representation shows London as it was previous to the Great Fire of 1666, with Old London Bridge, Old St. Paul's, Bridewell Palace, Baynard's Castle, [illegible] the Fleet River, Charing Cross as a village between London and Westminster, the houses of the Friars, and many other most interesting features. The models are very effectively arranged and lighted, and the exhibit is certainly one which should be seen. In connection with this a "souvenir" has been written by Mr. Loftie.

Among the exhibits in the British section of the Machinery Building is that of Messrs. Wailes, Dove and Co., the well-known makers of patent "Bitumastic" enamels, coverings and solution for the prevention of corrosion on iron and steel, and for the protection and preservation of wood. Their stand shows a model of a midship section of a vessel, and a model workshop with smoke stacks, etc., all coated with different "Bitumastic" specialities, which must prove attractive to visitors who are interested in the important question of corrosion.

Another interesting exhibit in the British section of the Machinery Hall is that of Messrs. Chance Bros., of Birmingham, whose exhibit includes various types of prismatic glass for the better lighting of interiors.



MR. H. T. CHAPMAN, assistant surveyor to the Lancashire County Council, has been appointed County Surveyor for Somersetshire, at a salary of £500, £250 for travelling expenses, and £20 for office expenses. There were 114 applicants for the position.

THE REVISED DESIGN FOR THE LOND

e by C. W. Wyllie.

HALL. RALPH KNOTT, ARCHITECT.

IN PARLIAMENT.

(By our Press Gallery Representative.)

Ancient Monuments.

Mr. Asquith has at last promised that the Government will appoint a Royal Commission to report on the preservation of ancient buildings and monuments in England. The Royal Academy, the Society of Antiquaries, the Royal Institute of British Architects and other societies have urged the right honourable gentleman to pursue this course, which has already been adopted in the case of Scotland, and promised in the case of Wales. Consideration will be given to a suggestion by Lord Balcarres that the three Royal Commissions should hold a conference in order that they might agree on a uniform system of classification, scheduling, and measurement of ancient monuments.

The New Law Courts.

There is to be no withdrawal from the decision to build upon the garden space lying to the west of the Law Courts. The new courts are estimated to cost £95,000, and Mr. Harcourt has satisfied himself that they are absolutely necessary.

Unemployment in the Building Trade.

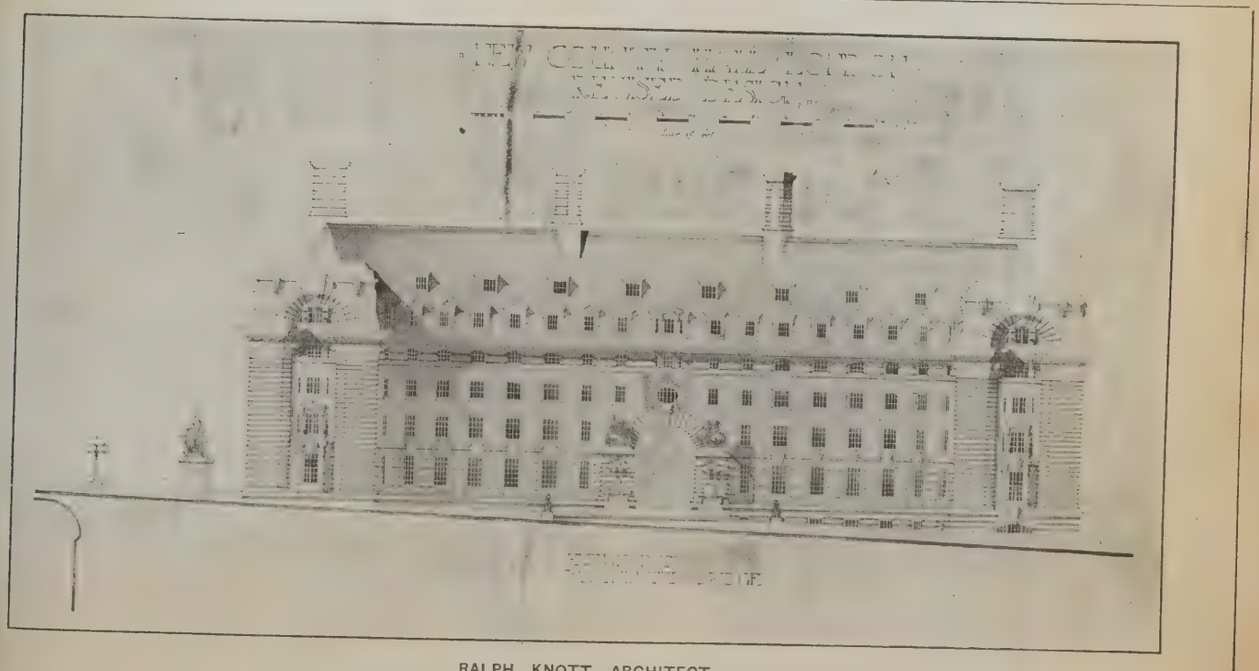
Mr. Thorne asked the First Commissioner of Works whether he could see his way to put in hand all the work that had been sanctioned, with all the speed possible, in consequence of the thousands of men who were out of employment in the various sections of the building trade in London.

Mr. Harcourt, in reply, said he was as much interested as the honourable member in pushing on building work for the current year. Everything was being put in hand as speedily as circumstances permitted.

New Buildings at Woolwich.

Mr. Haldane has informed Lord Balcarres that the area of ground which it is proposed to enclose for the purpose of the new buildings for the Royal Army Medical Corps at Woolwich is about two acres, and the estimated outlay is £12,500.

Law Cases.



BUILDING BEYOND THE GENERAL LINE.—At Lambeth Police Court on July 9th the London County Council summoned Mr. Edwin Stephens, of Walworth, for erecting a certain structure beyond the general line of buildings without the consent of the council.—The defendant admitted that there was a technical offence. —Mr. Thomas Chilvers, representing the County Council, said the defendant was the proprietor of the Montpelier Music Hall, which was situated at the rear of the Montpelier public-house. In December last the defendant erected an iron and glass structure in front of the entrance to the music hall, in advance of the general line of buildings. The defendant did not give notice to the district surveyor of his intention to carry out the work. If he had done so, he would in all probability have saved all the trouble. An assistant in the architect's department of the council attached to the Theatres and Music Halls branch, who visited the place for the purpose of seeing whether the theatre regulations were being carried out, observed that the structure was being put up, and told the defendant he ought to get the consent of the council. The defendant, however, did not apply for consent. It was subsequently reported to the council by the town clerk of Southwark, and a letter was sent to the defendant, who afterwards made an application for the consent of the council to the retention of the structure, but the council refused their consent. These structures had been held to be structures within section 22, and in the circumstances he (Mr. Chilvers) could only ask for a penalty and an order for demolition. —Mr. Hopkins imposed a penalty of 40s., and 23s. costs, and made an order for the demolition of the structure.

ENGINEERS' CLAIM AND ARCHITECT'S COUNTER-CLAIM.—On July 6th, at the Notts Assizes, Messrs. Crossley Brothers, gas-engine manufacturers, of Manchester, claimed from Mr. E. Hooley, architect, of Long Eaton, £176, the balance of an account owing for making a gas-engine and plant. The claim was admitted, but there was a counter-claim of £143 for loss of rent and damages resulting from the alleged late delivery of the engine.—Mr. Hooley's case was that in consequence of Messrs. Crossley failing to deliver the engine in time he lost a substantial sum in the shape of rents from the letting of standings in the new lace factory he had erected at Long Eaton during the trade boom. Messrs. Crossley contended that the engine was delivered within a reasonable time. It was stated, however, that instead of the engine reaching Long Eaton on May 20th, as had been agreed upon, it did not arrive until July 16th. Messrs. Crossley contended that they were unable to get on with the order because there was no plan of the plant, and no arrangement with regard to the engine bed. Judgment was given for Messrs. Crossley for the full amount of their claim—£176—and for the defendant, Mr. Hooley, on the counter-claim, £106 15s.

Our Plate.

The Revised Design for the London County Hall.

In this issue we are able to give the revised design for the London County Hall, which has been prepared by Mr. Ralph Knott, on the suggestion of the assessors. The design was the subject of considerable discussion at last week's meeting of the Council, but was ultimately approved. On reference to the elevation which we published in our issue for February 5th last, it will be seen that a very material change has been made on the river front, the centre block having been largely reduced in projection, and carried up into an attic storey, the flight of steps leading down to the river having been omitted, and slightly projecting steps taken down on either side parallel with the terrace. The alteration is certainly an improvement; it adds dignity to the building, though, even as now remodelled, we do not consider the design to be really worthy of the great opportunity which is embodied in it.

RALPH KNOTT, ARCHITECT.

CONTRACTORS' SECTION

(MONTHLY.)

THE BEARING POWER OF SOILS, BUILDING MATERIALS, ETC.

By T. E. Coleman, F.S.I.

The weight-bearing capacity of different soils varies considerably, according to the nature of the ground. Hard rock naturally provides the best possible foundation for supporting heavy concentrated loads, but for ordinary structures coarse gravel or compact sand is a good firm foundation for building purposes. Clay possessing a stiff dense nature, and which is not subject to any variation or excess of moisture, also gives satisfactory results; but soft wet clay is unreliable as a weight-carrying medium.

When buildings are erected on made ground, they should have their foundations carried down to the solid ground below. Alluvial soils, quicksands, etc., have practically no safe weight-sustaining powers, and in such cases the foundations require special treatment, piles being usually driven for the purpose of providing the additional support required.

The following table shows the average *safe* loads which can be carried by various descriptions of ground:—

	Average safe load. Tons per ft. super.
Quicksands	nil.
Alluvial soils	½ to ½
Made ground (ordinary)	½ to ¾
Made ground (consolidated)	¾ to 1
Clay (soft)	¾ to 1¼
Clay (hard, compact, dry)	2 to 4
Sand fine (dry, compact)	1½ to 3
Sand, coarse (ditto)	4 to 6
Gravel, fine (compact)	3 to 5
Gravel, coarse (ditto)	4 to 6
Chalk, solid	3 to 4
Rock, soft, friable	3 to 5
Rock, ordinary	5 to 15
Rock, hard, compact	20 to 60

London Clay.

With regard to the supporting power of London clay, it is interesting to notice that the foundations of Cannon Street railway bridge subsided slightly under a load of 5 tons per ft. super., whilst a similar subsidence occurred in the foundations of Charing Cross Bridge with a load of 7 tons per ft. super. During the construction of the foundations of the Tower Bridge it was ascertained from actual experiment that 6½ tons per ft. super. was the maximum load which could be supported by London clay, and a load of 4 tons per ft. super. was assumed to be the maximum safe load to be carried by the foundations of the piers. The foundation load of the famous Eiffel Tower at Paris was limited to a maximum of 3 tons per ft. super.

In the United States considerable attention has been given to the supporting capacity of different soils, owing to the heavy concentrated loads which are carried by tall city buildings. The Manhattan Insurance building of New York is 20 storeys in height, or 360 ft. from street level to roof, and it is estimated that the actual load on the brick foundations of this building exceeds 12 tons per ft. super. The building laws of New York stipulate that the safe bearing capacity of different soils may be taken as follows:—

	Safe bearing capacity. Tons per ft. super.
Soft clay	1
Ordinary clay and sand together, in layers	2
Loam, clay, or fine sand, firm and dry	3
Very firm, coarse sand, stiff gravel, or hard clay	4

When a doubt arises as to the safe sustaining power of the earth upon which a structure is to be erected, the Department of Buildings may order borings to be made, and the sustaining power of the soil tested at the expense of the owner. All records of tests made are filed for reference in the Department of Buildings.

Compressive Strength of Building Materials.

Numerous experiments have been made from time to time to ascertain the actual compressive strength of ordinary building materials. The average results obtained by crushing bricks, small cubes of stone, concrete, etc., are here given. It will be observed that the ultimate crushing strength of bricks, building stones, etc., varies considerably according to their quality or description. For convenience of reference and comparison, the average crushing strengths are given in tons per ft. super, and also in lbs. per sq. in.

Average Crushing Strength of Bricks, Building Stones, Concrete, etc.

	Tons per ft. super.	Lbs. per sq. in.
Bricks.		
London stocks (yellow)	100	1,500
Peterborough common (red)	90	1,400
White gault, wire cut	140	2,100
Ruabon, pressed (red)	360	5,600
Staffordshire blue, common	300	4,600
Staffordshire blue, best	450	7,000
Glazed bricks	160	2,500
Terra-cotta	160	2,500
Limestones.		
Ancaster	150	2,300
Bath	100	1,500
Bolsover	450	7,000
Chilmark	450	7,000
Ham-hill	260	4,000
Ketton	160	2,500
Portland	250	3,900
Sandstones.		
Craigleith	500	7,700
Darley-Dale	450	7,000
Mansfield	350	5,400
York	500	7,700
Granites.		
Aberdeen	650	10,000
Cornish	550	8,500
Devonshire	700	10,800
Guernsey	800	12,400
Irish	550	8,500
Concrete (after 1 month).		
Portland cement concrete (1 cement, 1 sand, and 6 parts broken brick)	23	350
Portland cement (1 cement. 1 sand, and 6 parts broken lime stone)	21	320
Concrete (after 6 months).		
Stone lime concrete (1 to 6)	9	140
Stone lime concrete (1 to 8)	6	90
Blue lias lime concrete (1 to 6)	18	280
Blue lias lime concrete (1 to 8)	12	180
Portland cement concrete (1 to 4)	75	1,100
Portland cement concrete (1 to 6)	60	930
Portland cement concrete (1 to 8)	35	540
Concrete (after 12 months).		
Stone lime concrete (1 to 6)	13	200
Stone lime concrete (1 to 8)	8	120
Blue lias lime concrete (1 to 6)	25	400
Blue lias lime concrete (1 to 8)	16	240
Portland cement concrete (1 to 4)	100	1,500
Portland cement concrete (1 to 6)	80	1,200
Portland cement concrete (1 to 8)	50	770

The following table shows the average crushing strength of brickwork, masonry, or concrete in walls, etc.

Average Crushing Strength of Masonry, etc., in Walls.

	Tons per ft. super.	Lbs. per sq. in.
Brickwork in walls, etc.		
Ordinary brickwork in lime mortar	28	430
Hard brickwork in lime mortar	40	620
Hard brickwork in cement mortar	60	930
Blue Staffordshire brickwork in lime mortar	75	1,100
Blue Staffordshire brickwork in cement mortar	100	1,500
Masonry in walls, etc.		
Rubble masonry in lime mortar	30	460
Rubble masonry in cement mortar	60	930
Ashlar masonry (limestone) in cement mortar	100	1,500
Ashlar masonry (sandstone) in cement mortar	150	2,300
Ashlar masonry (granite) in cement mortar	400	6,200
Concrete in walls, etc.		
Stone lime concrete (1 to 6)	13	200
Lias lime concrete (1 to 6)	25	400
Portland cement concrete (1 to 4)	100	1,500
Portland cement concrete (1 to 6)	80	1,200
Portland cement concrete (1 to 8)	50	770

On comparing the results given in the foregoing tables, it will be seen that the ultimate crushing strength of brickwork or masonry is considerably less than that of the bricks or building stones themselves; whilst further investigations show that the strength of the brickwork or masonry depends to a large extent on the description of mortar used, and also upon the skill employed in putting the materials together.

The average crushing strength of mortars as determined from tests made by Rondelet and Grant are here indicated:—

Average Crushing Strength of Mortars.

Lime mortar (after 18 months).

	Tons per ft. super.	Lbs. per sq. in.
Stone lime mortar	30	460
Lias lime mortar	50	770

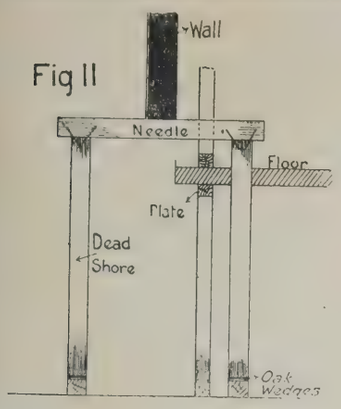
Cement mortar (after 9 months).

Neat Portland cement	350	5,400
Portland cement mortar (1 to 2)	200	3,100
Portland cement mortar (1 to 3)	150	2,300

When determining the maximum load which may be supported by any structure, it is essential that an adequate margin of safety shall be provided, so that failure by the actual crushing of the materials themselves cannot occur under ordinary circumstances. As a general rule, it is found that materials subject to heavy pressures usually crack with a load amounting to about half their ultimate crushing strength. To ensure a proper degree of safety under ordinary conditions it is considered that all walls, etc., should be so designed that the maximum load to be supported by any portion shall not exceed from one-seventh to one-eighth the actual pressure which would be necessary to crush the materials of which the wall is built.

The average safe bearing load, or resistance to compression, which may be borne by ordinary walls of brickwork masonry, or concrete, is as follows:—

Fig 11



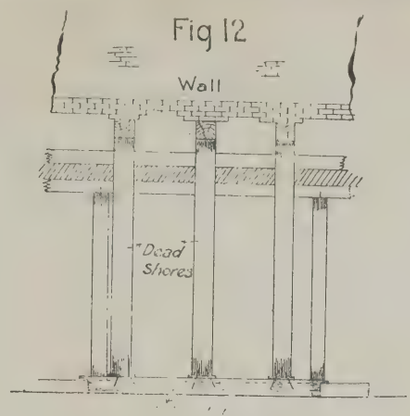


Fig 12

AVERAGE SAFE RESISTANCE TO COMPRESSION OR SAFE BEARING LOAD FOR WALLS, ETC.

	Tons per ft. super.	Lbs. per sq. in.
Brickwork in walls, etc.		
Ordinary brickwork in lime mortar	4	60
Hard brickwork in lime mortar	5	80
Hard brickwork in cement mortar	8	120
Blue Staffordshire brickwork in lime mortar	10	160
Blue Staffordshire brickwork in cement mortar	12	180
Masonry in walls, etc.		
Rubble masonry in lime mortar	4	60
Rubble masonry in cement mortar	8	120
Ashlar masonry (limestone) in cement mortar	12	180
Ashlar masonry (sandstone) in cement mortar	20	300
Ashlar masonry (granite) in cement mortar	50	770
Concrete in walls, etc.		
Stone lime concrete (1 to 6)	2	32
Lias lime concrete (1 to 6)	4	60
Portland cement concrete (1 to 4)	14	220
Portland cement concrete (1 to 6)	10	160
Portland cement concrete (1 to 8)	7	110
Mortars.		
Stone lime mortar	4	60
Lias lime mortar	6	100
Portland cement mortar (1 to 2)	25	400
Neat Portland cement (after 9 months)	45	700

The building regulations of New York require that the safe bearing load on brickwork, masonry and concrete shall not exceed the following limits:—

	Safe bearing load. Tons per ft. super.
Brickwork in lime mortar	8
Brickwork in cement mortar	15
Rubble masonry in lime mortar	5
Rubble masonry in cement mortar	10
Lime concrete	8
Portland cement concrete	15

It will be observed that the maximum safe loads allowed by American practice are slightly higher than those generally recommended in this country, owing to the adoption of a smaller value for the factor of safety than that already mentioned.

In considering the stability of retaining walls, it has already been stated that it is not usual or desirable to take into account the adhesive resistance of the mortar used in bedding and jointing the bricks or stones; yet in all soundly constructed work the cementing medium provides some slight additional margin of safety.

The average tensile strengths of lime and cement mortars are as follows:—

AVERAGE TENSILE STRENGTH OF MORTARS.
(After 12 months.)

	lbs per sq. in.
Stone lime mortar	56
Lias lime mortar	160
Cement mortar (1 to 3)	220
Cement mortar (1 to 2)	300
Neat Portland cement	450

It has been established, from numerous experiments, that the actual cohesive strength or *tensile resistance* of mortar is in itself considerably greater than the *adhesive strength* or tenacity of the same mortar as exerted in cementing the surfaces of bricks or stones to each other. The adhesive strength of mortar in brickwork or masonry varies within very wide limits, as it is largely dependent on the quality of the materials, workmanship, and the nature and condition of the surfaces to which it adheres, but for general purposes it may be taken as approximately $\frac{1}{8}$th the cohesive or tensile strength of the cementing material.

Average adhesive strength of mortar in brickwork and masonry.
(After 12 months.)

	lbs. per sq. in.
Stone lime mortar and common bricks	7
Lias lime mortar and common bricks	14
Lias lime mortar and hard stocks or ashlar masonry	24
Cement mortar (1 to 2), and hard stocks or ashlar masonry	30
Cement mortar (1 to 3), and hard stocks or ashlar masonry	40
Neat Portland cement and hard stocks or ashlar masonry	60

From the foregoing table, it will be seen that the tensile resistance of brickwork or masonry laid in ordinary mortar is comparatively small. When any structure is subject to a stress of this description, the ultimate tensile strength of the brickwork or masonry should be determined from a careful consideration of the nature of the mortar joints, as under such conditions these are the weakest part of the work.

SHORING.

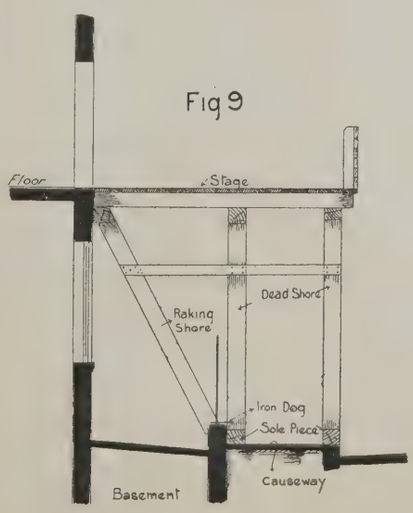
By Harold Slicer.

(Concluded from p. 525, No. 698.)

The whole of the materials employed in the construction of the staging shown in Figs. 9 and 10 were old stuff, but, being still sound, they were sufficiently strong for the purpose. This is a case where the basement of a house extended to the boundary wall, and repairs were to be carried out on the first floor, new fireproof flooring and steel joists inserted, etc. The staircase being narrow, access for the materials was made by way of a first-floor window, and the staging shown was erected to extend to the roadway, so that the materials could be hoisted direct on to the platform from the cart. As no support to the stage could be obtained from the house wall, three sets of shores were used, two upright or dead shores and one set of raking shores. The lower ends of the raking shores were cut to fit on to the boundary wall and the upper ends to support a head as shown. Sole-and-head plates were secured together by dogs, and a simple floor with vertical boarded sides erected thereon. Braces were carried across about 8ft. from the ground to bind the shores together.

The case shown in Figs. 13, 14 and 15 was designed to meet the leaning of the walls of a mill where the vibration of the spinning mules had caused the upper portion of the wall to project about 2ft. 6ins. out of plumb with the base. The following particulars have been kindly supplied by Mr. H. W. Barker, A.M.I.C.E., of the firm of Messrs. Thomas Barker and Son, of Bradford, who designed the system of shores illustrated:—There are several novel features involved. The first is the large concrete bases to support each system. This was necessitated by the solid ground being at a considerable depth below the surface, and as these shores had to be for permanent use, such a base was considered most suitable. The second novel feature is the introduction of purlins running from shore to shore (purlins 11ins. by 4ins.) fixed with $\frac{3}{4}$in. by 20in. joint bolt and 4in. cast-iron washers. Thirdly, the wall-plates had to be notched, as the stone window sills formed a continuous string; so extra pieces were bolted over these weakened portions to strengthen them. The distance of the feet of shores from mill wall varies on

Fig 9



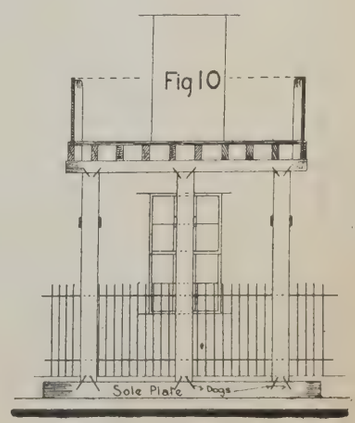


Fig 10

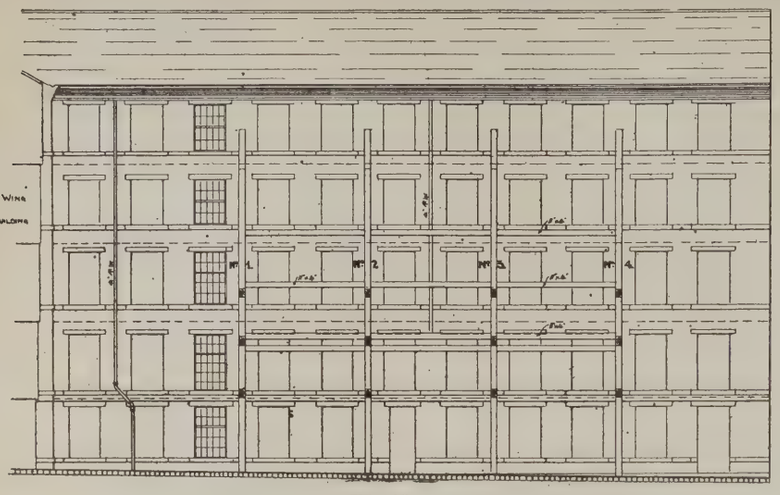

FIG. 13.

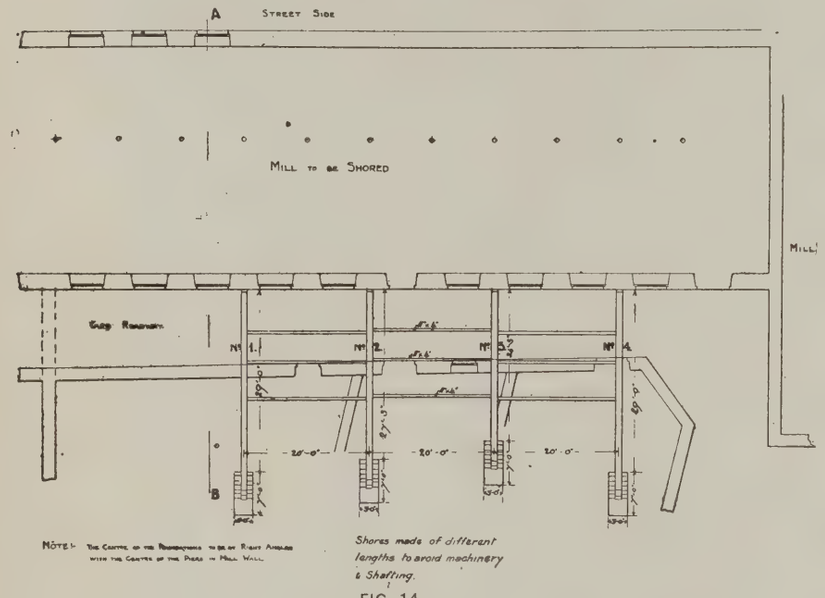

FIG. 14.

account of the machinery and shafting in the shed into which they project; this is shown on plan. The materials used were as follows:

Rakers 12in. by 12in. pitch-pine, sleepers 12in. by 4in. ditto, wall-plate 12in. by 4in. ditto, struts 9in. by 1½in. red deal well nailed to shores, purlins 11in. by 4in. red deal, oak needles 5in. by 5in., dry oak wedges for wedging up. All the woodwork below ground has two coats of boiled pitch and tar. The cost of the carpenter's work in shoring was about £170, and the concrete would be about £25. (The concrete used was 5 to 1 of Portland cement and stone, through 2in. ring gauge.)

Fig. 16 shows a case of raking shoring supported upon dead shores. This was done because the raking shores were first erected while an old building was being pulled down, and the dead shores were afterwards carefully inserted and the supporting earth removed to allow for extra depth of basement for the new building.

It is usual to incline the sole-plate slightly out of right angles with the raking shores, as shown in Fig. 17. This is done by allowing the shores to be tightended up by inserting a crowbar at their feet, and forcing them inwards towards the shored building. Now the end of the sole-plate at A is nearer to any needle compared with the end B; therefore, the nearer the shore feet approach A the

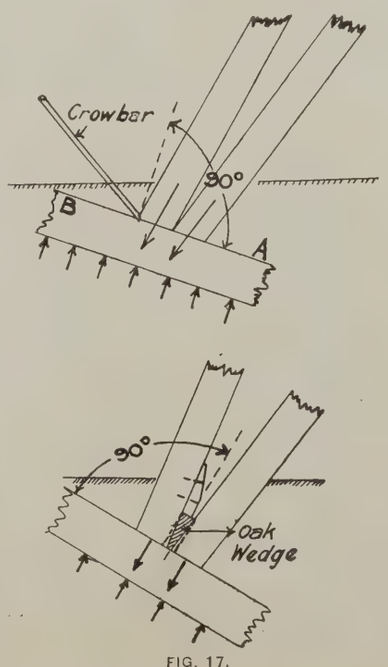

FIG. 17.

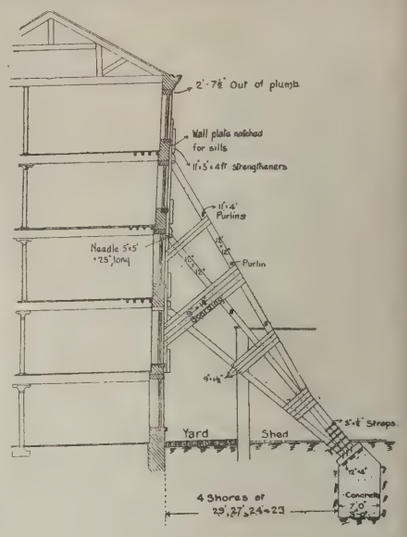

FIG. 15.

harder the upper end of the shores heads press on the needles, and consequently upon the wall supported. The earth resistance—to be on the side of safety—opposes the load from the sole-plate at right angles, as shown by arrows, but the pressure from the shores is slightly inclined to this, and provided that this angle is small (or the sole-plate embedded well into the ground) the angle of friction is not exceeded, and stability is ensured.

An alternative is to group the shores about a line at right-angles to the sole-plate, when pressure and resistance are then directly opposed. This is shown in the figure, oak wedges being inserted between the shore feet and held in position by a cleat or other mechanical means, or the ends of the shores trimmed as shown by dotted lines, whereby the shores may be tightened up as required.

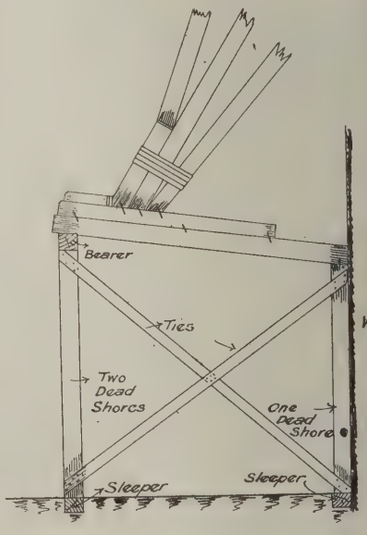

FIG. 16.

Notes and News.

A NATIONAL MEMORIAL TO THE LATE DUKE OF DEVONSHIRE is to be erected in Whitehall.

* * *

NEW BOOKS.—Messrs. Constable announce the publication of the two following new books:—"Analysis of Elastic Arches of Steel, Masonry, and Reinforced Concrete," by Joseph W. Balet, price 12s. nett; "The Design of Typical Steel Railway Bridges," by W. Chase Thomson, price 8s. nett.

* * *

CHANGE OF TITLE.—Messrs. William Cooper and Coussens, architects and surveyors, of 25, Havelock Road, Hastings, have altered the title of their firm to "Coussens and Rothwell" (Mr. Henry W. Coussens, A.R.I.B.A., and Mr. E. Rothwell).

* * *

A ROMAN CATHOLIC CHURCH at Berkhamsted, Herts, has just been commenced. The building is entirely of brick, and is being carried out by Messrs. H. and J. Matthews, of Berkhamsted, from designs by Mr. Geo. Harvey, architect, of Hemel Hempstead.

* * *

CHANGES IN BUILDING CONSTRUCTION.—At the congress of the Royal Sanitary Institute held at Cardiff last week, Sir Henry Tanner, who presided over the Engineering and Architecture section, dealt with changes that were taking place in building construction. He pointed out that wood had been largely abandoned, its place being taken by Portland cement or reinforced concrete. In buildings there was a great saving of space owing to the thinness of the external walls: carpenters, in consequence, were taking the place of bricklayers; but he did not think there need be any cause for anxiety as to the stability of this form of construction. He urged the discontinuance of the use of white lead in paint, this having a deleterious effect upon the health of the workpeople. In France zinc oxide or zinc white, which was innocuous, was substituted.

* * *

A PUBLIC OPEN-AIR BATH.—Through the enterprise of the First Garden City Co., Ltd., and the generosity of Mr. Christie Miller, a public open-air bath has been constructed at Letchworth, Herts. The site is in the Howard Park, well screened around with trees, and practically in the centre of the estate. The bath is constructed of cement concrete, rendered over with a coating of fine cement. It is 75 ft. long, 40 ft. wide, 6 ft. deep at one end, 3 ft. deep at the other, and has a capacity of nearly 80,000 gallons. Spacious wooden dressing-boxes are provided, and no expense has been spared to make the bath thoroughly up-to-date in every respect. It was designed by Mr. A. W. E. Bullmore, engineer to the First Garden City Co., and carried out by the company's own workmen under the superintendence of Mr. W. G. Satchell, works manager.

* * *

A BIG CONTRACT FOR IRON PIPING.—The municipality of Victoria, British Columbia, have placed with the Stanton Ironworks, Ltd., of Stanton, Nottinghamshire, and Southwark, the contract for the delivery of 300,000 tons of iron piping required in connection with the new water, gas, and other public improvement schemes. This contract, for which tenders were received from several leading British, Canadian, American, and Continental firms, is stated to rank as the most valuable individual order of its character ever placed by Canada.

* * *

AN INTERNATIONAL EXHIBITION OF DRAWINGS, in connection with the third International Art Congress to be held in London from August 3rd to 8th, will be opened by Princess Louise at the Imperial Institute, South Kensington, on July 27th, and will remain open for about a month. A special feature will an exhibit by the Ecole des Beaux-Arts, Paris.

* * *

A QUICK RETURN FOR BUSINESS ENTERPRISE.—As a practical instance of what enterprise in the erection of new works in a suitable place will do, the experience of Messrs. Henry Hill and Co. is interesting. Twelve months ago this firm acquired land and erected substantial new works at Derby, finding employment for between two and three hundred hands in the manufacture of incandescent gas mantles. The works were put up on the most modern lines, and great savings in the costs of manufacture resulted, insomuch that the whole of the shares of the company have been acquired by the Welsbach Incandescent Gas Light Co., Ltd., at a very substantial premium. The directors of Messrs. Henry Hill and Co. may well be pleased with such quick returns as a result of their forward policy.

* * *

RETENTION OF CONTRACT MONEY.—The Sheffield Society of Architects and Surveyors and the Sheffield Master Builders' Association have directed attention to the practice of the Corporation in retaining, in connection with building contracts, 10 per cent. of the contract prices for a period of twelve months after the completion of the work, and have urged that the keeping in hand of that amount for the period named worked a hardship on, and meant a loss to, contractors. The Finance Committee recommend that in future one half of the 10 per cent. be paid on the expiration of six months, and the other half at the end of twelve months.

* * *

THE DEPARTMENT OF ARCHITECTURE AT THE UNIVERSITY OF SHEFFIELD has been founded at the desire of the Sheffield Society of Architects and Surveyors, and the Board of Architectural Association have appointed Sir Aston Webb and Mr. Halsey Ricardo to act as visitors. The department will provide (1) a systematic course of training for students wishing to become architects (to be taken by them before entering an architect's office, though not necessarily before they are articled), and (2) an advanced and continuous course of study for students during their pupilage, and also when they become qualified assistants. Mr. W. S. Purchan is the lecturer, assisted by leading Sheffield architects. The Michaelmas term begins on October 7th.

* * *

ROYAL SANITARY INSTITUTE: NEW MEMBERS.—Following is a list of new members of the Royal Sanitary Institute elected during the present month. Those marked thus * have passed the examination in Sanitary Science as applied to Buildings and Public Works; those marked thus † the examination for Inspectors of Nuisances; those marked thus ¶ the examination qualifying for membership. E. Ault, F.S.I., London; *T. R. Bailey, Fleetwood; J. K. Colwell, F.I.C., London; J. M. Glasse, M.B., Northumberland; A. H. Hogarth, M.B., Whitechapel, E.; *H. T. Hooper, P.A.S.I., Thornton Heath; C. E. Humphreys, M.R.C.S., Montgomery; *J. G. Jones, Wandsworth, S.W.; W. M. Jones, F.C.S., Chester; ¶†W. G. Marshall, Grays, Essex; F. A. Pickles, A.M.Inst.C.E., Nottingham; †A. E. Purnell, Wandsworth Common, S.W.; T. H. Scott, Inverness; *†H. G. Sharp, Oldham.

* * *

AT THE HEALTH EXHIBITION held at Cardiff from July 13th to 22nd, in connection with the 24th Congress of the Royal Sanitary Institute, Messrs. Burn Brothers, of 3, Blackfriars Road, London, S.E., were awarded a silver medal for cast-iron drains and soil-pipe fittings, while their exhibit of sewage syphons was deferred for further consideration. Bronze medals were awarded to Messrs. Adams-Hydraulics, Ltd., of 7, Old Queen Street, Westminster, for conical cross-bar penstocks; to Messrs. W. Summerscales and Son, Ltd., of Phœnix Foundry, Keighley, for steam-jacketed cooking pan; to Messrs. The Eagle Range and Gas Stove Co., Ltd., of 127, Regent Street, W., for their "New Premier Range"; and to Messrs. T. G. Williams and Co., for "Mack" slabs. The exhibit of conical manhole and lamp-hole covers by Messrs. Adams-Hydraulics, Ltd., was deferred for further consideration. Among the exhibits shown at the exhibition was one by the Glover-Lyon Ventilation Co., of Caxton House, Westminster, comprising illustrations of buildings which have been ventilated on their system.

PORTLAND CEMENT TRADE.

With almost utter stagnation continuing in the building trade, it is not surprising that we are unable to report any improvement in the demand for Portland cement. It appears to be correct, however, that large constructional works in different parts of the country, such as docks and harbour works, are calling for increased quantities, and there certainly appear to be signs of much more activity in this direction than has been the case for a long time past. Cheap money is apparently beginning to have its effect in this department, and many of the larger corporations throughout the country are arranging to put in hand heavy work which has been hung up for some years past, mainly for financial reasons. Although so far there has been no rush for Portland cement this season, reports indicate a considerable reduction in stocks at works, and some of the more optimistic among the makers are confident of a much stronger market towards the autumn, particularly if, as seems probable, there is a revival in the export demand. The tenders which were due on June 1st for the cement required for the Panama Canal have not yet been adjudicated upon. It appears that all the bids were sent to the Chief of the Commission in Panama for the final letting.

The exports of Portland cement from this country show a very considerable falling off as compared with last year, but still some slight increase as compared with 1906; practically the whole of the falling off is due to diminished shipments to the Pacific Coast of America, both North and South. On the other hand, the imports into this country continue to show a decrease. Those for the six months to the end of June are about 10 per cent. lower than they were for the corresponding half of 1907.

Correspondence.

An Old Lancashire Church.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I, through the medium of your valuable paper call attention to the proposed alterations to an historical church at Sefton, Lancashire? This old relic dates back as far as the Reformation, is constructed of stone (even the seats are of stone), and the torture chambers, etc., still exist. But it is going to be altered, the drawings showing the proposed alteration being now on view in the church.

Surely this should not be allowed without an attempt to prevent it. If there is any society which looks after such matters, I hope they will do so in the present case. C.S.

[The Society for the Protection of Ancient Buildings (the secretary of which is Mr. Thackeray Turner, 20, Buckingham Street, Strand, W.C.) concerns itself with these matters.—Ed. B.J.]

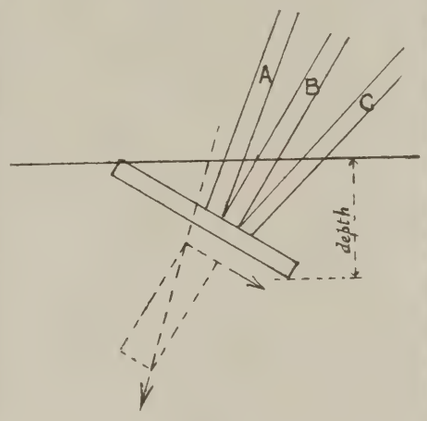
Deposits for Conditions of Competitions.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I offer a suggestion to Mr. Travers who, in your last issue, confesses to having been victimised by the time-honoured confidence trick, practised by committees promoting architectural competitions? In his next letter asking for particulars of competition, and covering the usual deposit, let him insert some such passage as this:—"I understand that a proper assessor will be appointed to advise your committee, and that the conditions are such as are usual." If, then, when he receives his conditions, he does not like them, let him stop his cheque, and thereby throw upon the committee the onus of proving that it is entitled to the deposit.

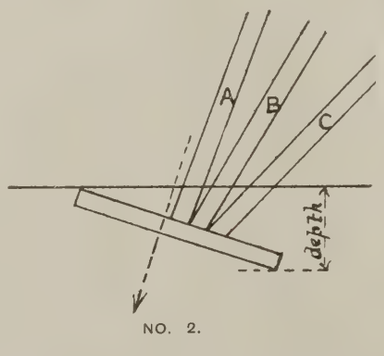
I have formed this habit, and it is the occasion of such gratification that I am always glad when the conditions show the advertisement to have been misleading. I even look forward to being sued with greater pleasure than to winning a competition, but I have, with regret, formed the opinion that the activities necessary to goad a committee to the point of taking action are beyond my powers of achievement. F.R.I.B.A.

Shoring.



To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am obliged to your contributor for his reply to my letter in regard to the above on p. 37 of your issue for July 15th. With an experience of 35 years in shoring and similar work, I was interested to find a present-day article on the subject—such as that in your issue of June 24th—advocating a novel method of placing the sole-piece, and I naturally assumed that there must be some new and good reason for it. The explanation given, however, is disappointing.



Your contributor quotes from Mr. Stock's book on shoring. If he will refer again to that book he will see that it is there clearly laid down that the sole-piece must be placed obliquely to the rakers. It is 20 years since I read the book, and I have not a copy by me to quote chapter and verse, but I well remember the great stress laid upon this feature, and the reasons given. Your readers can turn up "Specification" or any reputable text-book, and I am sure that they will find the same thing emphasized.

An average raking shore is not easily handled, and yet it is most important to go gently and carefully with structures needing to be shored up. The upper end of the shore should be notched to fit the needle, as shown in your contributor's article. The raker should then be gently lowered against the wall-plate under the needle, and carefully prised forward with a crowbar until the head of the shore slides up into its place and gets its bearing under the needle. Now this can only be done when the sole-piece is laid obliquely; and (referring to the sketches) C is fixed first, then B, and lastly, A.

Your contributor supports his principle by quoting from an actual erection in which tightening was obtained by wedging at the upper ends of the rakers, and he also suggested wedging between the feet. I must leave the merits of this practice to the judgment of your readers, but I might point out that an observant surveyor or builder will often meet with actual erections that are very bad examples.

NO. 1.

NO. 2.

If the sole-piece is placed at right angles to the shores, as shown in sketch No. 1, and as advocated by your contributor, the tendency is for the sole-piece to force its way inwards and downwards, because the resultant force is always more vertical than the usual angle of the rakers. But if the sole-piece is placed at an angle slightly less than a right angle to the top raker (as shown in sketch No. 2), it will be more nearly square with the resultant force, and, therefore, will be more stable.

Another drawback in your contributor's suggested method is the extra depth of excavation, and where a platform and concrete is necessary this is a matter for consideration.

The point is, Why should one depart from a well-established principle except by way of improvement: and, if so, what is that improvement?

BUILDING SURVEYOR.

Notes on Competitions.

Free Library and Institute, Dolgelley.

Our attention has been drawn to yet another instance of the familiar practice of obtaining designs "on the cheap." This is the case of the competition for a new free library and institute to be built at Dolgelley, at a cost of £650. The "conditions" are issued on a scrap of flimsy paper, accompanied by a feeble site plan, and the promoters offer £10 for "the best design and plans." The selection will be made by the committee in charge of the matter. This is the sort of competition which perpetuates all the bad features which architects have been trying to get rid of for so many years past. Designs have to be sent in by August 12th to the Rev. W. Titus-Jones, Brynyffynon, Dolgelley, Merioneth.

New Schools at Eccles.

The awards in this competition are as follows:—1st, Mr. Henry Lord; 2nd, Messrs. Charles Clegg and Son; 3rd, Mr. J. N. Fletcher—all of Manchester.

Secondary School for Boys, Bromley.

The following architects are to be invited to submit designs in competition for a secondary school for boys which is proposed to be erected at Bromley:—Mr. C. H. B. Quennell, Mr. Arnold Mitchell, Mr. H. P. Burke-Downing, Mr. J. Ladds, Mr. E. Hellicar, and Messrs. Russell and Cooper—all of London. Mr. John Bilson, F.R.I.B.A., of Hull, will act as assessor.

Extension of Princess Alice's Hospital, Eastbourne.

On the recommendation of the assessor (Mr. A. Hessell Tiltman, F.R.I.B.A.), the design submitted in this competition by Mr. W. Hay Murray, of Eastbourne, has been provisionally accepted.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
July 31	ELEMENTARY SCHOOL AT BANBURY.—Conditions from Oliver J. Stockton, Town Clerk, Banbury. Deposit £1
Aug. 1	COUNTRY HOSPITAL, GUERNSEY.—Conditions from Thomas Robin, President of Directors of Country Hospital, Castel, Guernsey.
Aug. 7	SECONDARY SCHOOL AND TECHNICAL INSTITUTE AT CLECKHEATON (150 places).—Premiums £50, £30, and £20. Particulars from J. H. Linfield, Clerk, Town Hall, Cleckheaton.
Aug. 31	PARISH CHURCH AT BISHOPSWEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Road, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Oct. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
No date.	SCHOOL AT DEVONPORT. Limited to architects in the Three Towns. Premiums 20 and 10 guineas.
No date.	SITE-PLAN FOR COTTAGE EXHIBITION, SWANSEA, 1909. Gold, silver, and bronze medals, together with sums of £20, £15, and £10. Particulars from Henry R. Aldridge, Secretary to Exhibition, 7, Gower Street, Swansea.

Obituary.

THE LATE MR. W. R. DAVIES, builder, of Birkenhead, left estate value £34,069.

THE LATE MR. JAMES HORN, builder, of Newcastle-on-Tyne, left estate which has been proved at £28,497 gross.

THE LATE MR. R. F. VALLANCE president of the Society of Architects, left estate which has been proved at £30,158.

Current Market Rates of Materials in the Various Trades.

e quotations given in this list apply only to larger quantities purchased in London (the minimum quantity for which these prices pplicable being given where practicable). Retail purchasers must expect to pay a reasonable advance on wholesale rates, as well riage. The trade discounts for each item have not been considered, as these would be affected by the quantity of the goods ased. The endeavour is made to give fair average prices which would in many cases be affected by the quality of the materials ed.

BRICKLAYER.

- Recently Executed Buildings and Engineering Works.

"Specification" provides all the information that professional men require when preparing drawings writing specifications or compiling bills of quantities, saving the time usually spent in consulting a large number of books. Each section is compiled by a specialist in the particular branch of which they treat, and is arranged under the usual trade headings of a complete specification, thereby greatly enhancing its value.

ARCHITECTURE... and JOURNALISM.

This is the title of a Booklet, beautifully printed and illustrated, giving an interesting account of the publications issued by this Company.

This booklet contains a suggestion, and sets out an arrangement showing how Architects and others can utilize any particular points of interest that they come across in their practice, and thus not only add to their own incomes, but add to the value and practical interest of our papers.

TECHNICAL JOURNALS, Ltd.

Westminster, S.W.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 22-August 5. LONDON, S.W.—Erection of Quartermaster's Quarters, etc., and **Mortuary and Disinfecting Establishment** at the Alexandra Hospital, Cosham, Hampshire, in the Southern Command. Plans and specifications may be inspected at the Office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., and the Barrack Construction Office, Alexandra Hospital, Cosham, not later than July 22. Applications for bills of quantities and form of tender must be received not later than July 24, and on payment of the sum of ten shillings (not returnable) they will be forwarded by the Director of Barrack Construction. Tenders, marked "Tenders," are to be delivered not later than noon on August 5, to the Director of Army Contracts, War Office, London, S.W. The bills of quantities are to accompany the tender in separate sealed envelope similarly addressed, and marked "Bills of Quantities for Work at the Alexandra Hospital, Cosham," and also with contractor's name and address.

July 23. READING.—Construction of public convenience for men and women at junction of Southampton Street and Mount Pleasant, Reading. Particulars at the Borough Engineer's Office, Town Hall, Reading. Tenders, in the printed addressed envelope provided for the purpose, to be delivered not later than noon on July 23 to John Bowen, Assoc.Mem.Inst.C.E., Borough Engineer and Surveyor, Town Hall, Reading. Fair wages clause.

An Important Announcement.

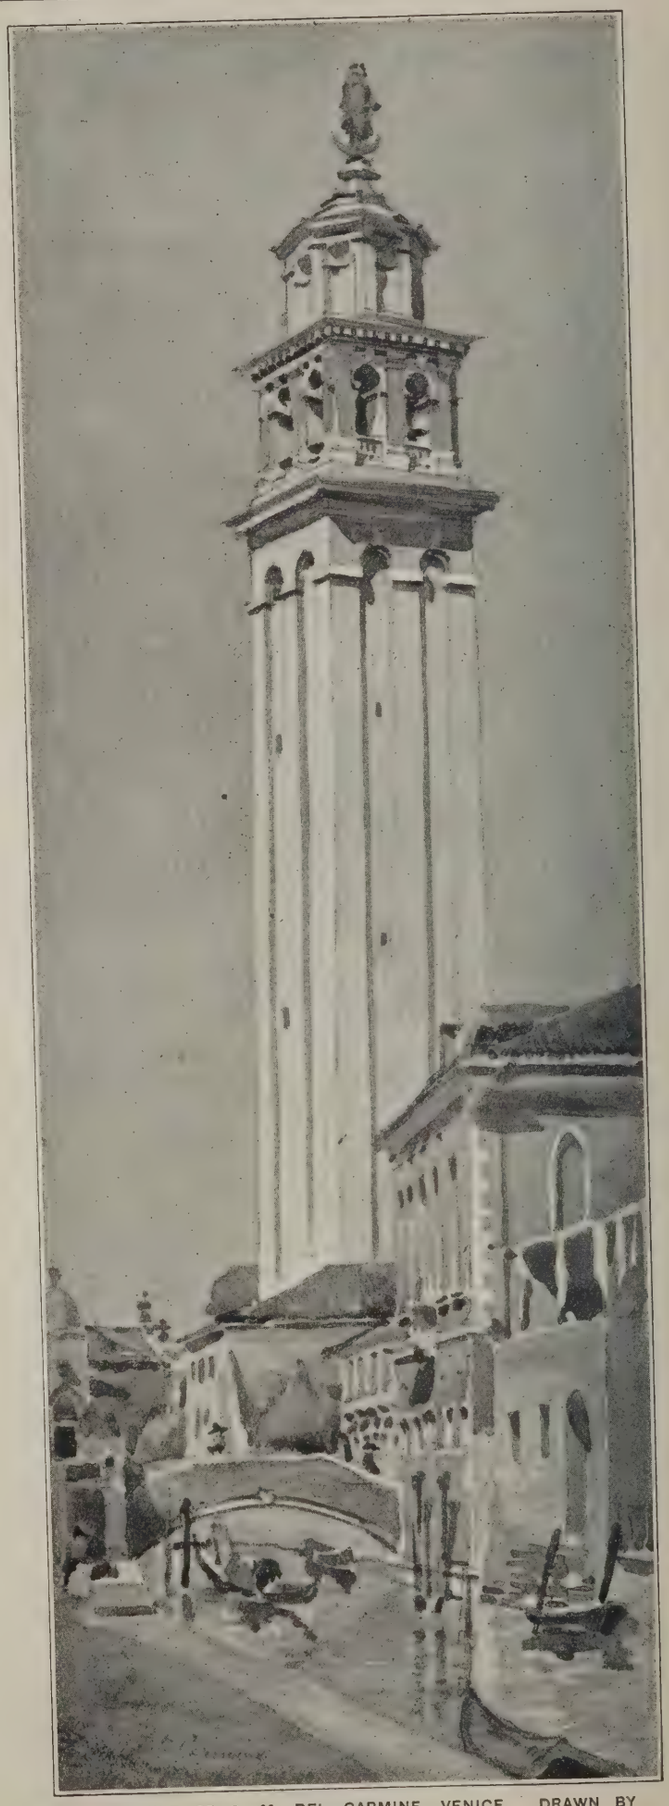
In the report of the Building Act Committee presented to yesterday's meeting of the London County Council an important announcement is made in regard to the much-needed amendment and consolidation of the London Building Acts. With the Housing and Town Planning Bill now before Parliament, unsettled, the Committee consider that it would be useless to attempt to promote legislation in the next session for the general amendment of the Building Acts, but they think there is one important matter which should be dealt with then, namely, the use of steel construction and reinforced concrete in buildings. The Committee point out that this method of construction was not contemplated in the Act of 1894, "and there is no doubt that a change of the law in this direction is necessary in order to meet modern building requirements, and we have been strongly urged by the Royal Institute of British Architects, the Institution of Civil Engineers and the Surveyors' Institution to promote legislation with that object. Under the London Building Act, 1894, the walls of all buildings must be of the thickness prescribed by the first schedule of the Act, with the effect that the walls of buildings mainly constructed of steel or reinforced concrete have to be of a greater thickness than is necessary for stability, thus unnecessarily diminishing floor space of the buildings. We are advised by the solicitor, under Standing Order No. B163, that the Council has power to promote legislation on the subject, and we have informed the Parliamentary Committee in accordance with standing order No. B 161 (2) of our intention. We are of opinion that the suggested amendment should be secured as quickly as possible, and we therefore recommend—(*a*) That the operation of Standing Order No. B. 161 be suspended in order that the following recommendation may be dealt with; (*b*) That application be made to Parliament in the session of 1909 with a view to the amendment of the London Building Act, 1894, so as to facilitate the use of steel or reinforced concrete in the construction of buildings and to make any necessary provision with regard thereto." Obviously, this is a more important recommendation. It marks the beginning of a new era of construction in the metropolis, and we may expect that, with the existing unfair and illogical requirements removed, concrete and steel construction may go forward with leaps and bounds.

The Hampstead Garden Suburb.

A most hopeful report was presented at last week's annual meeting of the Hampstead Garden Suburb Trust, Ltd. In moving the adoption of the report, Mr. Alfred Lyttleton, K.C., M.P., said the Hampstead Tenants, Ltd., which was a co-partnership society, had already 63 houses occupied on the land, 110 in course of erection, and 154 more arranged for, for which 300 shareholders were waiting. Large areas had also been taken for the erection of workmen's cottages and residential flats for working ladies. Without being unduly sanguine or optimistic, one might say that the development of the estate had exceeded almost all their hopes. The part of it which was most advanced at present was that devoted to the tenant co-operators, and the designs for the cottages and the gardens with which they were surrounded would satisfy the most exacting critics. The estate was not bought in the first instance for nothing, nor was it developed for nothing. He was glad to be able to tell them that the work of development was proceeding so rapidly that they had thought it desirable to place in hand the designs of the central square, in relation to which the whole scheme was grouped. Mr. Lutyens had in hand the designs for the central church and the Free Church which were to be erected there, and there was every reason to anticipate that they would be beautiful buildings. The roads had already been laid out to the extent of 1½ miles, and, to meet the demands for land, the directors were arranging for extensions which would bring the total up to over 3½ miles.

Excavations in the Roman Forum.

During the past year the excavations carried out in the Forum at Rome, under the direction of Commendatore Boni, have been just beyond the Arch of Titus, with the object of tracing the original temple of Jupiter Stator. These excavations, however, do not appear to have been very remunerative, as nothing of importance has been discovered. More interesting have been the excavations at the eastern entrance to the Basilica Maxentius, where a floor of a room has been laid bare which must have belonged to the Golden House of Nero—a floor paved with polygonal fragments of glass, pale green and dark blue in colour, arranged in a geometrical pattern. The excavation of the Basilica Æmilia has made some progress, more than half of the embankment being already carted away, but here again the mass of earth and rubbish contained nothing of any value, except a few fragments of African marble and portions of old columns. Before the end of this year it is hoped that the pavement of the Basilica may be reached, and some light may perhaps be thrown on the causes of its destruction. Commendatore Boni hopes to be able to carry out a plan for joining the Forum and Palatine, in which event he would open passages from one to the other in the ancient Porta Mugonia, the old gate of the Palatium, and through the staircases, now blocked, which descend from the Imperial palaces to the Via Nuova.



The "Stud" Tramway System.

After a lengthy and heated discussion at last week's meeting, the London County Council decided to cease the use of the "G.-B." (Griffiths-Bedell) system of electric tramways laid down from Aldgate to Bow, on the ground that accidents had occurred, and the public safety was endangered. The Stepney Borough Council would not permit the overhead system, and the conduit system would have been very costly to lay down because of the Whitechapel and Bow Railway, which comes near the surface. It was decided, therefore, to try the "stud," or surface-contact, system, more or less as an experiment. A system of this nature—the Lorain—was installed at Wolverhampton six years ago, where it is understood to have given satisfactory results, and another surface-contact system—the Dolter—has been installed at Hastings, at Torquay, and at Mexborough: while the "G.-B." system has been used at Lincoln for some time past over about 3½ miles of route. The working of the "G.-B." system is as follows:—On the car is a steel cable, or "collector," about ¾in. in diameter, carried by insulators. Along the road, at intervals of about 6ft., the "studs" are fixed, level with the street paving. Each stud has a plunger, which normally is held up, but becomes magnetic and makes contact with the cable when the car passes over it; and as the cable is so arranged that it does not break contact with one stud before it makes contact with the next, a continuous supply of current is fed to the car motors. As regards cost of working, this is said to be about the same as for the overhead system; so that the "stud" system combines the merits of the overhead and the

conduit systems, without the disadvantages of either—that is to say, it is not unsightly like the overhead system, and is not so costly as the conduit system. As to its safety, the Bow experiment would appear to indicate that the system is deficient in this respect, though we have not heard that this is the case in the towns named above, where it has been in use for some years.

The Architectural Courts at the Crystal Palace. In view of the attention which is now being directed to the future of the Crystal Palace, it is opportune to point out how very much the facilities for art and architectural education there provided are neglected. The existence, within Paxton's glass structure, of a Pompeian House and the Egyptian, Greek, Roman, Alhambra, Byzantine, Romanesque, Renaissance and Mediæval Courts is well known, but very few people take the trouble to see these most interesting representations. Architectural students, especially, should make a point of doing so, because the Courts have been prepared with great care and skill, and are excellent examples of their kind. While referring to them, we cannot help remembering Ruskin's poignant reference to the lack of a representation of Gothic art in London: for which, he says, such as it is, we have either to go to the South Kensington Museum, where it is mixed up with steam threshing machines and dynamite-proof ships of war, or to the Crystal Palace, where it is mixed up with Rimmel's perfumery! That, of course, was before the founding of the Architectural Museum in Tufton Street, now the home of the Architectural Association.

Photography as an Aid to Measuring Buildings. We take the following from the "British Journal of Photography," dated July 17th:—"Architectural students frequently require measurements of buildings, and in the case of the larger structures these are often by no means easy to obtain. By selecting a time when the front of one of the cathedrals is covered with scaffolding this measuring does not present insuperable difficulties, though assistance with the measuring tape is usually necessary. If no such scaffolding is available the work must be done by means of ladders, and often at considerable bodily risk, though the method of lowering a rope marked distinctly in 3ft. lengths may sometimes be useful, distances being set off on a rough sketch elevation by a colleague situated on the ground and at some little distance. Some recent experiments have shown us that considerable use may be made of photography in this direction, provided a few special points are attended to. First, a view-point should be chosen as nearly as possible opposite the centre of the frontage, and in every case the axis of the lens must be absolutely at right angles to the frontage. On some part of the building a scale must be made by marking chalk lines at a distance of, say, 3ft. apart. If it is undesirable to mark the building in this way four or five white rods or laths may be set on the pavement in a vertical position and placed a yard apart. Measurements on the one plane only can be made, though if there are two parallel planes the one photograph may be utilised for measurements on both planes, provided a scale is attached to each plane. The depth of a recess or the extent of a projection cannot be measured from the photograph."

CAMPANILE OF S. M. DEL CARMINE, VENICE, DRAWN BY LESLIE WILKINSON, A.R.I.B.A.

An Irish Society and the R.I.B.A.

A curious state of affairs has been caused by the action of the Ulster Society of Architects in its relation to the Irish Institute and the R.I.B.A., as the outcome of which the Ulster Society has seen fit to lodge a protest against the petition of the R.I.B.A. for a new charter. The case is well put in the current issue of "The Irish Builder," and we cannot do better than reproduce our contemporary's remarks, with which we are entirely in accord:—

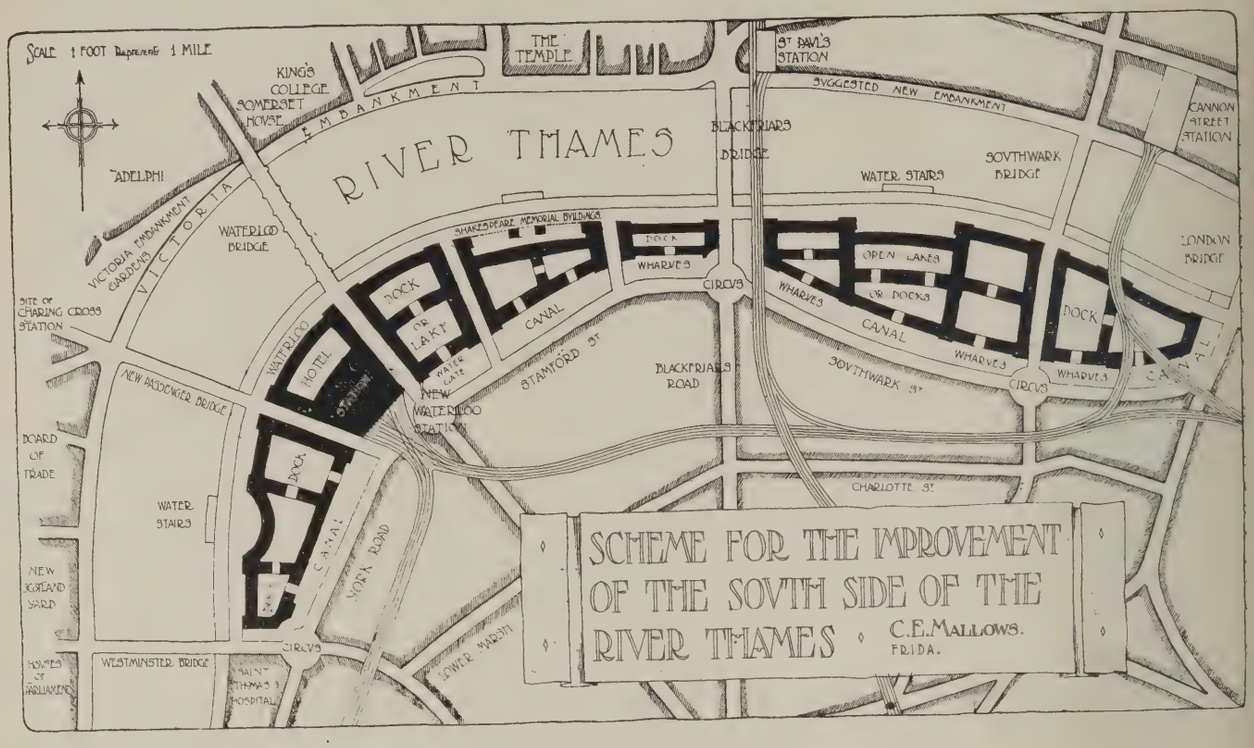
"The Royal Institute of the Architects of Ireland is an old-established body, dating back so far as 1837, and has ever since been regarded as the representative body of the profession in Ireland. About the year 1889 the Irish Institute became allied to the Royal Institute of British Architects: allied, be it marked, *not* affiliated. The Irish Institute preserved its own constitution, by-laws, governing council, and the right to manage and regulate all its affairs, and its relation to individual members, absolutely free and unfettered. Up to a few years ago the Council of the Irish Institute had the right of nominating to fellowships of the British Institute such Irish architects as they unanimously considered worthy of that distinction, and such persons were almost invariably elected as a matter of course; but even this slight link or privilege has for several years past ceased, and Irish aspirants to fellowships of the British Institute are required to be nominated and elected in the ordinary way after furnishing testimonies of their professional works. With the cessation of this practice ended the smallest interference of the one Institute with the affairs of the other. The sole indication of the connection between the two bodies that now remains is that a representative of Ireland is entitled to sit upon the Council of the British Institute in London, the object not being to enable Irish architects to meddle in purely English affairs, but that the representative of the Irish Institute may be enabled to act in concert with the English in important matters affecting the profession as a whole, and also to ensure, as far as practicable, uniformity of practice in relation to the public. Further than this there has been no intermeddling by the one Institute in the affairs of the other, and the British Institute has always recognised the status of the Irish Institute as representative of the profession in all Ireland, and the entire country as its sphere of influence. Now, quite recently—only a few years ago—the Ulster Society of Architects was founded under the auspices of the Irish Institute, and Sir Thomas Drew, out-going president of the Institute, became the first president of the new society. Following the precedent of the British Institute, the Ulster Society was accorded the privilege of sending a representative to sit as a member of the Council of the Royal Institute of the Architects of Ireland. This arrangement continued amicably until the Ulster Society suddenly proposed to lower the scale of fees which had so long prevailed, and which were all but universal throughout the country, save in Belfast. It is unnecessary to here debate this point. The folly of lowering a scale of fees which had received all but universal acceptance is too obvious to need demonstration. The Institute, of course, could take no other course than to firmly object to any such change, whereupon the Ulster Society severed its official connection with the Irish Institute, though its individual members, who were also members of the Institute, still continued their membership. The next step of the Ulster Institute was to approach the English Institute and ask to be allied with that body, and as such recognised as a representative professional body in Ireland, the exclusive right to which status was always claimed and held by the Institute. The British Institute referred the matter to the Irish Institute, which pointed out that the recognition of any other and independent Irish society would be a breach of both the letter and spirit of the alliance. The British Institute loyally adopted this view, and has ever since adhered thereto. The Ulster Society, receiving no encouragement in London, issued a threat to the Irish Institute that unless the Irish Institute withdrew its opposition to the British Institute giving the Belfast Society recognition and entering into an alliance with them, all the Belfast members of the Institute would resign. The Irish Institute, of course, received this threat uninspired by the terror that the Belfastmen evidently expected, and, strange to say, only two or three of the ringleaders carried out the threat. This threat failing to achieve its object, the Belfast Society next threatened the English Institute, first that those of their members who happened to be also members of the English Institute would compel a ballot to be taken in the case of every Fellow or Associate proposed for election, and finally by lodging with the English Privy Council a petition against the granting of the charter sought by the English Institute. It is hardly necessary to point out that it is not possible for the British Institute to recognise a second or rival society within the sphere of influence of the Irish Institute, or to ally itself with a body which has officially lowered the standard of prevailing fees. Nor need it be indicated that if the British Institute were to act in bad faith and recognise the Belfast Society, it would be quite as open to the Irish Institute (as to any other body) to lodge a petition against the granting of the charter—though we feel certain such a 'dog-in-the-manger' policy is about the last means of furthering their desires or venting their displeasure that they would contemplate. The whole matter is one of very trivial importance indeed, so far as the general public is concerned, and the efforts of the Ulster Society to thwart and hinder the schemes of the British Institute, for having acted fairly by the Irish Institute, would hardly be worthy of comment were it not for the unpleasant spectacle of disunion it displays before the Privy Council and others outside the profession, which is most lamentable, and conveys an impression of want of dignity and restraint that is singularly unfortunate for the reputation of the architectural profession."

Campanile of S.M. del Carmine, Venice.

This good example consists of a shaft of red brick, relieved with pilaster strips, carrying a rich belfry stage with 2-arched openings with stone dressings in each face, and crowned with a bold block cornice; above this is an octagonal stage with niches and a pyramidal roof, all in stone, and surmounted by a large bronze statue. The church to which it is attached was consecrated in 1348. The tower probably dates from the 17th century.

THE RENAISSANCE IN FRANCE.

The immigration of Italian artists into France which commenced under the auspices of Charless VIII., and culminated in the reign of Francis I., did not succeed in overthrowing native art. Indeed, it was not until many years later that the full significance of the classic revival was realised in France, for native art was sufficiently strong to prevent the movement, in its earlier stages, from resulting in anything more than the formation of the distinctive style we are accustomed to associate with the architectural products of the reigns of Francis I. and Henry II. The buildings of these periods are, architecturally, neither wholly French nor wholly Italian. The influence of Gothic art still appeared in the constant use (in conjunction with the classic "orders") of lofty and highly decorated chimneys, turrets, pavilions, and elliptical arches, with which fenestration of a more or less mediæval character was usually combined, and it was not until many years later that the geometrical formality of the *real* classic style altogether took the place of free artistic phantasy.



Nowhere can the very gradual development of the architecture of the Renaissance in France be studied with greater advantage to the student than in the series of buildings erected in Paris during the two hundred years which elapsed between the accession of Francis I. and the death of Louis XIV. Among the most illustrious names of the French architects of the early French Renaissance are those of Pierre Lescot, Philibert de l'Orme, Pierre Chambiges, and Jean Bullant; among those of the middle period, Salamon de Bresse, Jacques Lemercier, and Francois Mansart hold the pride of place; whilst the later period of Louis XIV. will be for ever associated with the more matured Renaissance work of Claude Perrault, Levau, and J. H. Mansart.

Under Francis I. the city of Paris commenced to throw off its mediæval aspect and to assume a new form. The old Gothic chateau of the Louvre was demolished, and the erection of a new palace was commenced, a royal College for instruction in the sciences was founded, and improved means of communication were opened between various parts of the city. The construction of the Hotel de Ville was taken in hand, and the Faubourg St. Germain laid out anew.

The construction of the Arsenal, Quai de la Tournelle, and the Place Maubert is associated with the reign of Henry II., and during this period the work on the Louvre was continued, and the whole of its western front (the Vieux Louvre) and the wing containing the Gallerie d'Apollon were completed.

During the reign of Charles IX. and Henry III. the wars of religion and (more particularly) the massacre of St. Bartholomew had a disastrous effect upon the progress of art, but among other buildings the Tuileries, the Hotel de Scissons, the Hotel de Burgoyne, and the Théâtre Italien date from those troublous times.

When peace was restored to the kingdom by Henry IV., the further embellishment of the capital was continued on a grand scale, and during the reign of this king the Pont Neuf was completed, the neighbourhood the Arsenal improved, the Hospital of St. Louis founded, the Place

Royale, the Rue Dauphine and the neighbouring quays laid out, and great additions made to the Tuileries and the Louvre.

During the reign of Louis XIII. the Palais Cardinal (afterwards known as the Palais Royal) was commenced by Richelieu, the Luxembourg by Marie de Medicis, and the Cours de la Reine was planted. The quays and bridges of the Ile St. Louis were constructed, the Faubourg St. Honoré was united with the villages of Roule and Ville l'Evêque, and the Faubourg Saint Antoine with Popincourt and Neuilly.

At the time of Louis XIV. the population of the capital had overthrown the ancient walls of Philip Augustus (which had been already extended by Francis I.), and the king, believing that a strong community needed no such protection, proceeded to demolish the old towers and ramparts of the fortifications, to fill up their fosses, and to form new boulevards in their place. More than eighty new streets were opened, the old city gates were swept away and superseded by triumphal arches, and the Place de Vendome and the Place des Victoires were constructed. In addition, thirty-three new churches were erected, the Hotel des Invalides, the Colonnade of the Louvre, and the Pont Royal were completed, the Champs Elysées planted, and the Tuileries enlarged.

However much we may feel inclined to cavil at the perhaps far too laudatory references made by Voltaire in his work (*Le Siecle de Louis XIV*) to the artistic aims and aspirations of this monarch, it must not be forgotten that it was entirely owing to the encouragement given by Louis XIV. to native and foreign artists that Renaissance architecture in France was at length able to altogether free itself from the fetters of mediævalism, and to assume its proper aspect of stately formality and geometrical symmetry.

A SCHEME FOR THE IMPROVEMENT OF THE SOUTH SIDE OF THE THAMES.

The various proposals and suggestions brought forward for dealing with the problem of the improvement of the south bank of the Thames seem to have been finally set aside in favour of one emanating from the London County Council, under which a low-level embankment, some thirty to forty feet wide and suitable only for pedestrians, is provided. Yet, even at this, the eleventh hour, it is still in the power of the citizens of London to prevent the realisation of what we venture to predict will be regarded by posterity as a most egregious blunder.

Surely it is obvious that any *real* extension of the city proper can now only take place on the south side of the river, and if the sapient advisers of an equally sapient public authority admit this premise, we may well ask why the immediate future requirements of the largest and wealthiest city in the world are absolutely ignored in the so-called "improvement" scheme which has been matured by officials of the London County Council. For various reasons, based on practical requirements and on æsthetic considerations, the new embankment thoroughfare should at least correspond in width with the present Victoria Embankment, and behind it there should be ultimately raised a terrace of public and other stately buildings to balance in architectural effect those on the opposite side of the river.

This, the proper treatment for the south side of the river, was developed by Mr. C. E. Mallows as long ago as June, 1903, when he prepared the accompanying scheme for a new embankment to commence at Westminster Bridge, and extending the whole length of the river to London Bridge, thus doing justice to what he regards as the finest river in the world. Mr. Mallows' proposals may be briefly outlined as follows:—

(1) A new wide embankment, built o two levels, corresponding to the terrac and embankment in front of Somerse House, of which the higher level would b utilised for general traffic so that shippin could pass without hindrance into (2) series of basins or canals, arranged at th back of the terrace buildings, extendin the depth of the site and approache from the river by locks and waterway around which could be built the variou wharves, warehouses, offices, and othe business places displaced by the scheme (3) groups or terraces of public and othe buildings.

We think the suggestion made by M. Mallows deserves the serious consider tion of all who are interested in wel thought-out proposals prepared with th view to the permanent improvement of ou vast metropolis. Hence, although th scheme which we illustrate has bee already brought under the notice of th London County Council, and has also, some extent, since become public propert we feel we need offer no apology to ou readers in affording them a furth opportunity of studying and criticisin what appears to us to be an extreme able solution of a very difficult proble

---

The Establishment Committee of t London County Council recommend th tenders be now invited from selected fir for the construction of an embankment the site of the new County Hall; while t Local Government, Records, and Museu Committee recommend that a water-colo drawing (5ft. by 3ft.) be made by M Wyllie of the site as it exists at prese for inclusion in the Council's records.

The International Drawing Exhi tion at South Kensington, which i cludes an exhibition by the *Ecole d Beaux-Arts*, Paris, was opened by H.R. Princess Louise on Monday, and will r main open until Saturday, August 15th

Correspondence.

An Old Lancashire Church.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The attention of the Committee of the Society for the Protection of Ancient Buildings has been called to the letter signed "C.S." which appeared in your issue of July 22nd, on the subject of Sefton Church, Lancashire.

It may interest your readers to know that as far back as the year 1890 the building was receiving the attention of this Society, and that in the year 1892 a destructive scheme of "restoration" and enlargement was abandoned, largely owing to its opposition.

With regard to the proposed alterations referred to by "C.S.," the Society is making inquiries, and it is to be hoped that nothing is in contemplation which would, if carried into effect, detract from the beauty and interest of this valuable ancient building.

THACKERAY TURNER,
Secretary.

20, Buckingham Street,
Adelphi, W.C.

Deposits for Competitions.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Surely architects have a very simple remedy in their hands regarding this question. I make a practice of sending my cheque for a deposit dated four days ahead. If the promoters refuse to forward conditions, you know there is a desire to rob you, and your cheque is stopped, and so the matter ends. If conditions are sent and you judge them to be unfair, return them (without a stamp, if you are of a vindictive nature), stopping cheque as before. If this were made a general custom, we should not hear so often of this very dishonourable trick being practised on members of our own profession.

E. P.

London, E.C.

PORTSMOUTH SPECULATIVE BUILDERS & THE LOCAL BY-LAWS

A Meeting of Protest.

A meeting of the speculative builders of Portsmouth was held last week to protest against the local building by-laws.

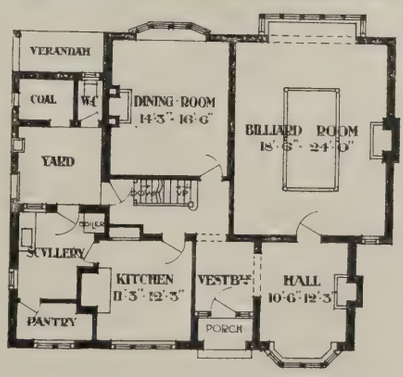
Mr. W. Brittan said the by-laws in their present form were such that they must either be ended or mended. He particularly drew attention to the demand for 9-in. walls for small greenhouses and sheds, which he declared was absurd and ridiculous. He further asserted that the Committee were inconsistent, inasmuch as where plans had been passed providing for 4½-in. walls, the Building Surveyor insisted on 9-in. He suggested that a deputation should wait upon the Committee with a view to getting a compromise and a definite interpretation put upon the regulations. Speculative building in the town was the backbone of the building trade in Portsmouth, and provided work for hundreds; and it was only fair that they should at least have some consideration in the matter.

Mr. Arthur Chase thought that by the friendly action they proposed a more serious crisis might be averted. He was sorry that the Master Builders' Association had not seen their way to take the initiative, but he pointed out that many of the big contractors were not affected like the speculative builders. Two interpretations could be put upon the by-laws as at present worded, and it was hard to know whose interpretation was to be accepted. Until they had some intelligent interpretation they did not know where they stood.

Mr. Griffiths also expressed his regret that the Master Builders' Association had not come to their aid just as the speculative builders had acted with them in other contingencies. He suggested that they should formulate a report pointing out the anomalies of the by-laws. He also moved that the Master Builders' Association be asked to join with the speculative builders in a conference on the matter. This resolution was carried unanimously.

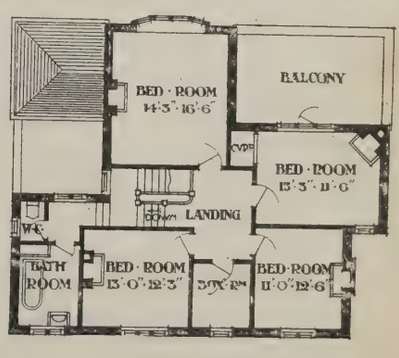
Notes and News.

CHANGES OF TITLE.—The firm of "Umlandt and Nicoll," builders and contractors, of 98, Cherry Orchard Road, East Croydon, has changed its title to "Umlandt and Gibson."—The title of Messrs. W. Griffiths and Sons, of Great George Street, Liverpool, is now changed to "Wm. Griffiths and Sons (Liverpool), Ltd." They have purchased the high-class plumbing and decorating firm of Messrs. B. Kay and Sons, of Alderley Edge, Cheshire, and have also opened London offices at 74, Victoria Street, S.W.



* * *

SURREY COUNTY SURVEYORSHIP.—Ninety-four applications have been received for the appointment of county surveyor under the Surrey County Council, rendered vacant by the resignation of Mr. F. G. Howell after fifteen years' service. The final selection was made yesterday.



* * *

THE WHITEFRIARS GLASS WORKS.—By permission of Messrs. James Powell and Co., the Society of Engineers recently paid a visit to the Whitefriars Glass Works, Tudor Street, E.C. In the mixing room the raw materials of glass were found, showing among other things the formation of lead-glass and soda-lime glass. The pot room was inspected, and in it was seen a stock of finished crucibles, as well as some in course of being built up rod by rod. The goods, when finished by the workman, are slowly cooled or "annealed," either by being

Ground-Floor Plan.

First-Floor Plan.

HOUSE AT SALE, CHESHIRE. T. W. HUDSON, ARCHITECT.

This house has been built for Mr. F. Mitchell (of the "Clipper" Belt Hook Co., 251, Deansgate, Manchester) to suit the owner's requirements, facing Broad Road and overlooking Sale Park at the rear. Common bricks have been used, specially burnt with grey sides for the exterior and worked in stretcher-bond, using 2 in. "Anchor" Wall Ties for all walls. The chimneys are of Ruabon red bricks, and the roofs of Broseley tiles. The interior walls are finished in Brother's cement on the ground floor. The whole of the woodwork and walls are finished with "Ripolin" paint (gloss and flat), being thus rendered perfectly sanitary, and all washable. Strip panelling has been used for the vestibule, hall and billiard-room, the ceiling of the last-named being finished with beams and rafters. Mr. T. W. Hudson, of 2, Exchange Street, Manchester, was the architect, and Mr. William Thorpe, of Old Trafford, the contractor.

gradually moved away in iron pans from a fixed source of heat in the "bars," or by being placed in a chamber or "kiln," in which the source of heat is allowed gradually to die out. In the cutting shop particular interest was taken in the process of decorative cutting by means of iron or stone wheels, fed respectively with sand mixed with water, and with water alone. The sheet-glass cutting shop was also visited, where the glass is cut either with a diamond or a small steel wheel.

* * *

A CHEAP HOUSES EXHIBITION IN PARIS.—An exhibition of cheap dwelling-houses is now being held in Paris, on the quays of Cours de la Reine, whose conservatories have been sold to a contractor to be pulled down, for £1,000. This exhibition is practically confined to three or four large societies, whose object is to enable the working classes to provide homes for themselves.

* * *

DISCOVERIES AT GLASTONBURY ABBEY.—While pursuing his excavations in the nave at Glastonbury Abbey on Thursday last Mr. Bligh Bond uncovered near the base of the western chancel arch the foundations of what is supposed to be a much older building than the present ruin. Some magnificent specimens of complete coloured mosaic tiles were turned up, but the chief feature was a medallion dated 1105. It is conjectured that this was struck to commemorate the work of Abbot Herlewin, who ruled Glastonbury Abbey from 1101 to 1120, and who was the first to begin buildings on an imposing scale. Much of his work was destroyed in the great fire which nearly swept away the Abbey in 1184.

* * *

THE ANCIENT CHURCH OF ST. NICHOLAS, PLUMSTEAD, the transept and the south and west walls of the nave of which date from the thirteenth century, was severely damaged by the disastrous explosion which took place in the Chemical Research Department—a sort of off-shoot of the Royal Arsenal—on Plumstead Marshes, on February 11th, 1907. The fabric has now been restored, and additions have been made on the east and north sides, under the direction of Messrs. Greenaway and Newberry.

* * *

THE NORTHERN ARCHITECTURAL ASSOCIATION, on Wednesday last, visited Northallerton County Hall (Mr. Walter H. Brierley, architect), and afterwards motored to Mount Grace—an old Carthusian house, now the residence of Sir Cecil Spring-Rice. They subsequently visited Rounton Grange and Arncliff Hall, concluding the day with a dinner at Northallerton, when Mr. Arthur B. Plummer was presented with a silver salver and a hall clock as a mark of the members' appreciation of his services as hon. secretary of th Association—a position from which Mr. Plummer has recently retired.

* * *

MESSRS. ROBERT MCALPINE AND SONS, of Glasgow and London, have secured the contract for the construction of a new power station at Dunston, near Newcastle, required by the Newcastle Electric Supply Co. The work is to cost about £60,000, and its special feature is that, as the ground has a poor bearing capacity, the whole site is to be covered with a heavy concrete floor resting on piles. This floor is to carry a great weight of machinery and the concrete is reinforced. For the same company Messrs. McAlpine are also boring tunnels under the Tyne and Wear.

* * *

THE LATE SIR RANDAL CREMER, M.P., who died on Wednesday last, was trained as a carpenter. In 1859 he assisted in the Unionist agitation which resulted in the celebrated lock-out in the building trade. His first notable achievement was to unite several small and weak unions into a strong and compact body, the Amalgamated Society of Carpenters and Joiners. He was the first general secretary of the International Working Men's Association, and throughout his life worked towards the ideal of making international arbitration a substitute for the brutality of war.

* * *

NEW MUNICIPAL WORKS.—The Local Government Board has decided to hold inquiries into proposed expenditure by public bodies as follows:—*Water supply works and plants.*—Wellington Rural District Council, £1,700 (July 20). *Sewerage, drainage, and sewage disposal works.*—Colchester Borough Council, £4,700 (July 31); Ripley Urban District Council, £4,077 (Aug. 5); Cuckfield Rural District Council, £10,000, for Balcomb (Aug. 5); Hailsham Rural District Council, £5,050, for Polegate (Aug. 6). *Street improvements, roads, pleasure grounds, and public walks.*—Wembley Urban District Council, £1,370 (July 27); Colne Borough Council, £17,925 (July 29); Portsmouth Borough Council, £15,093 (July 31). *Various.*—Coventry City Council, £25,956, for refuse destructor (July 29); Colne Borough Council, £1,500, for public library (July 29); Altringham Urban District Council, £4,500, for public baths (July 30); Portsmouth Borough Council, £5,000, for public lighting (July 31); Salford Borough Council, £22,711, for public baths (Aug. 6).

SHEFFIELD CITY ARCHITECT APPOINTED.—Mr. F. E. P. Edwards, F.R.I.B.A., City Architect of Bradford, has been appointed City Architect of Sheffield, at a commencing salary of £650 per annum. From 147 applications the selection was reduced to six candidates. In giving the names of these in our issue for July 15th, Mr. Reginald G. Kirkby, A.R.I.B.A., was styled "architect to the Glamorgan County Council": this, however, is incorrect, Mr. Kirkby being associated with Mr. D. Pugh-Jones, F.S.I., of Cardiff, who is the County Architect (Eastern Division). Mr. Edwards, the successful candidate, was appointed City Architect of Bradford in December, 1900, when this department was formed. He is a native of Cheltenham, and was for a time an assistant with the late Professor Middleton. From 1886 to 1889 he was an assistant in the Architect's Department of His Majesty's Prisons Commission for Scotland in Edinburgh, and afterwards until his appointment in Bradford he was

FRANCO-BRITISH EXHIBITION: DETAIL OF BAY WINDOW, ROYAL PAVILION.

FRANCO-BRITISH EXHIBITION: DETAIL OF SIDE ENTRANCE, FRENCH APPLIED ARTS PALACE.

assistant in the Liverpool Corporation Architect's and Surveyor's Department. In Bradford Mr. Edwards has designed and superintended the carrying out of a very large amount of work for the Corporation. The most important undertaking is, of course, the extension of the Town Hall, in respect to which he has Mr. Norman Shaw, R.A., associated with him as consultant.

* * *

PROPOSED MEMORIAL TO GAINSBOROUGH.—A movement is on foot to erect a memorial to Gainsborough at his birthplace, Sudbury, in Suffolk, and a committee has been formed in furtherance of this object.

* * *

A NEW LIQUID ENAMEL.—Messrs. John Mathews and Co., of Hatton Garden, Liverpool, have put on the market a new liquid enamel, to which they have given the name "Apex." It is claimed for this enamel that it will not blister nor crack, and that it possesses an exceptionally hard surface. It has been applied at the Liverpool Dispensary, where it is fully realising the claims made on its behalf. "Apex" is not only prepared in white, but is also supplied in various colours. We understand that Messrs. Mathews are finding an excellent market for this new material—which, in the present state of business in all departments associated with building, is no slight testimony to its excellence.

* * *

ENGINEERING STANDARDS COMMITTEE.—The Royal Institute of British Architects has nominated Mr. Edwin T. Hall, senior vice-president, to represent that Institute on the sectional committee on bridges and general building construction, of which the chairman is Sir John Wolfe Barry.

* * *

SANITATION 3,500 YEARS AGO.—On Friday last, at the Summer Meeting of Extension Students at Cambridge, Dr. A. J. Evans delivered a most interesting lecture on "The Recent Excavations in Crete." The excavations, he said, conclusively showed that Crete was the true cradle of European civilisation. At Minos they found strata to the depth of about 25ft., carrying them through relics of forms of civilisation which took them back in successive stages to an antiquity of at least 12,000 years. Dr. Evans showed by slides the results of his excavations in the Minonian palaces of a period about 1,600 years before the Christian era. A great feature was the perfection of the domestic architecture. A knowledge of sanitation was shown equal to the best of modern ideas. It included such things as inspection chambers and vent shafts, while the terra-cotta water-pipes displayed an ingenuity and effectiveness in design which modern hydraulic science could not excel.

* * *

THE BELL TOWER OF CHICHESTER CATHEDRAL.—The reparation of the Bell Tower of Chichester Cathedral is now complete. This work has cost about £2,000, which has to be added to the total of £130,000 spent on the Cathedral fabric since the central spire fell in 1861. The tower dates from about A.D. 1420-40, and is to-day the only detached campanile connected with any cathedral in England or Wales. The work now completed was required not because the structure itself was unsafe, but because the surface-stone was badly decayed. Professor Church, who has given similar advice at Westminster Abbey, the Houses of Parliament, and Canterbury Cathedral, urged that the stone should be soaked in a preservative solution of baryta. This has been done, and no stones have been removed which it was in the least degree possible to preserve. The work has been carried out by Messrs. Vick, of Chichester, under the direction of the Cathedral architect, Mr. Somers Clarke, Prebendary Bennett acting as honorary clerk of the works.

LYONS' GRAND RESTAURANT AT THE FRANCO-BRITISH EXHIBITION.
Plasterwork by the Bromsgrove Guild.

THE FRANCO-BRITISH EXHIBITION.

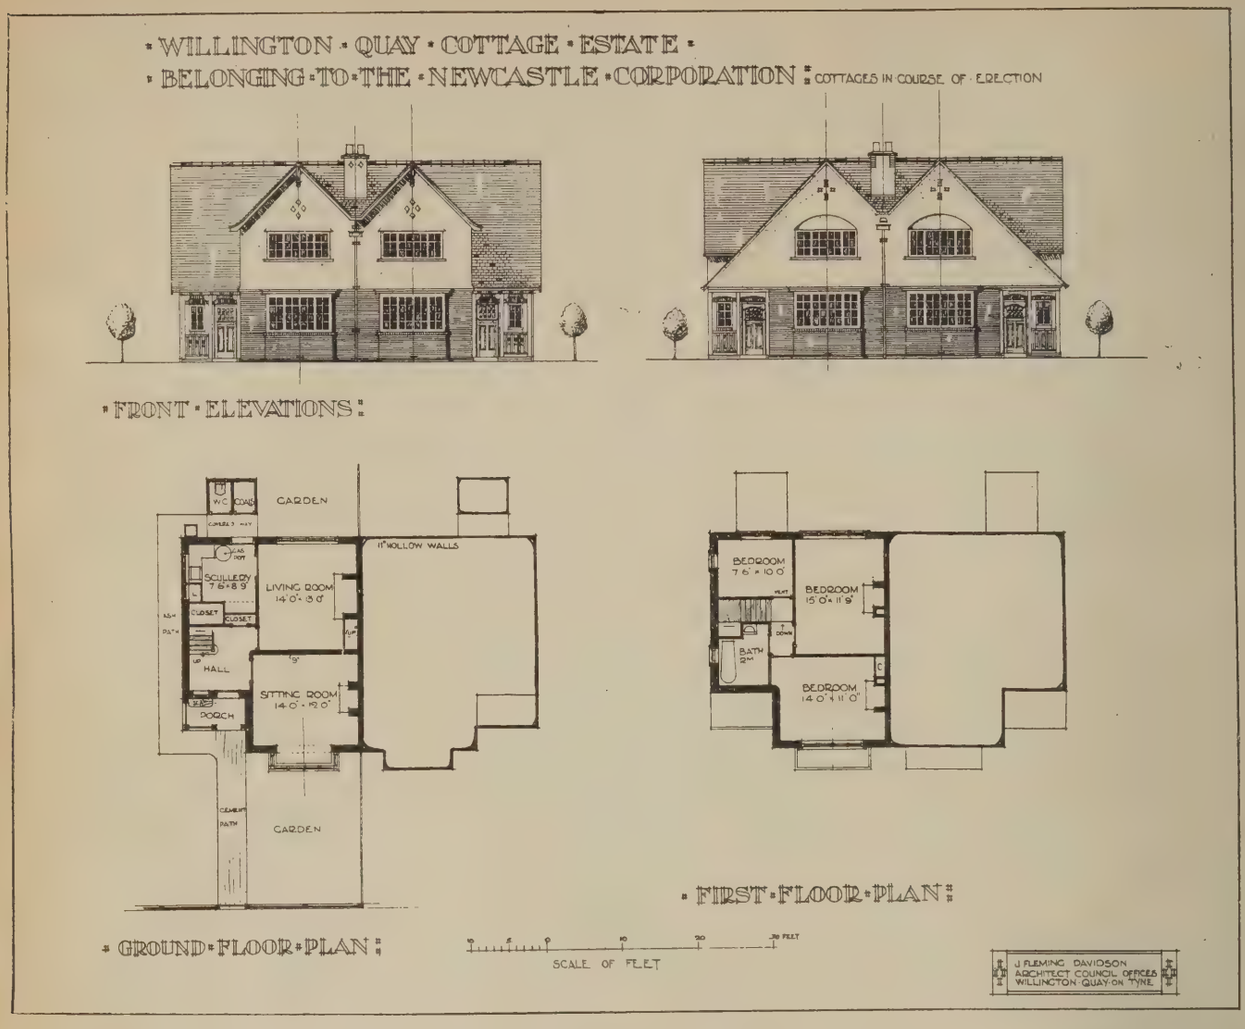
We give in this issue some views of work at the Franco-British Exhibition at Shepherd's Bush which were crowded out of our issue for last week, when we dealt with the Exhibition at length. The accompanying illustrations are all examples of plasterwork, and do not call for extended notice, though we would draw special attention to the excellent work which has been done by the Bromsgrove Guild in Lyons' Grand Restaurant.

Notes on Competitions.

Secondary School, Market Drayton.

The design by Mr. Joseph Holt, A.R.I.B.A., of Manchester, has been placed first in this competition, and has been adopted by the Committee; 98 sets were submitted, these being assessed by Mr. H. Beswick, F.R.I.B.A., County Architect for Cheshire.

New Schools, Tebay.



The design by Messrs. Sproat, Farmer, and Warwick, of 18, Cook Street, Liverpool, has been placed first by the assessor, and adopted by the Education Committee. About fifty designs were submitted.

Extension to Royal Infirmary, Bristol.

The following architects have been selected to compete for this work:—

H. Percy Adams
T. W. Aldwinckle
W. A. Pite
J. W. Simpson
A. Saxon Snell
A. Hessell Tiltman
Young and Hall
} London.

Arthur Marshall, Nottingham.
Everard, Son and Pick, Leicester.
Henman and Cooper, Birmingham.
T. Worthington and Son, Manchester.
E. Kirby and Sons, Liverpool.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
July 31	ELEMENTARY SCHOOL AT BANBURY.—Conditions from Oliver J. Stockton, Town Clerk, Banbury. Deposit £1.
Aug. 1	INTERMEDIATE SCHOOL AT YSTRADGYNLAIS (BRECONSHIRE), for 120 children. 10 guineas offered. Designs to be sent in to L. J. Kempthorne, clerk to Governors, Duffryn Chambers, Neath.
Aug. 1	COUNTRY HOSPITAL, GUERNSEY.—Conditions from Thomas Robin, President of Directors of Country Hospital, Castel, Guernsey.
Aug. 7	SECONDARY SCHOOL AND TECHNICAL INSTITUTE AT CLECKHEATON (150 places).—Premiums £50, £30, and £20. Particulars from J. H. Linfield, Clerk, Town Hall, Cleckheaton.
Aug. 31	PARISH CHURCH AT BISHOPSWEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Road, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Oct. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
No date.	SITE-PLAN FOR COTTAGE EXHIBITION, SWANSEA, 1909. Gold, silver, and bronze medals, together with sums of £20, £15, and £10. Particulars from Henry R. Aldridge, Secretary to Exhibition, 7, Gower Street, Swansea.

COTTAGES AT WILLINGTON-ON-TYNE

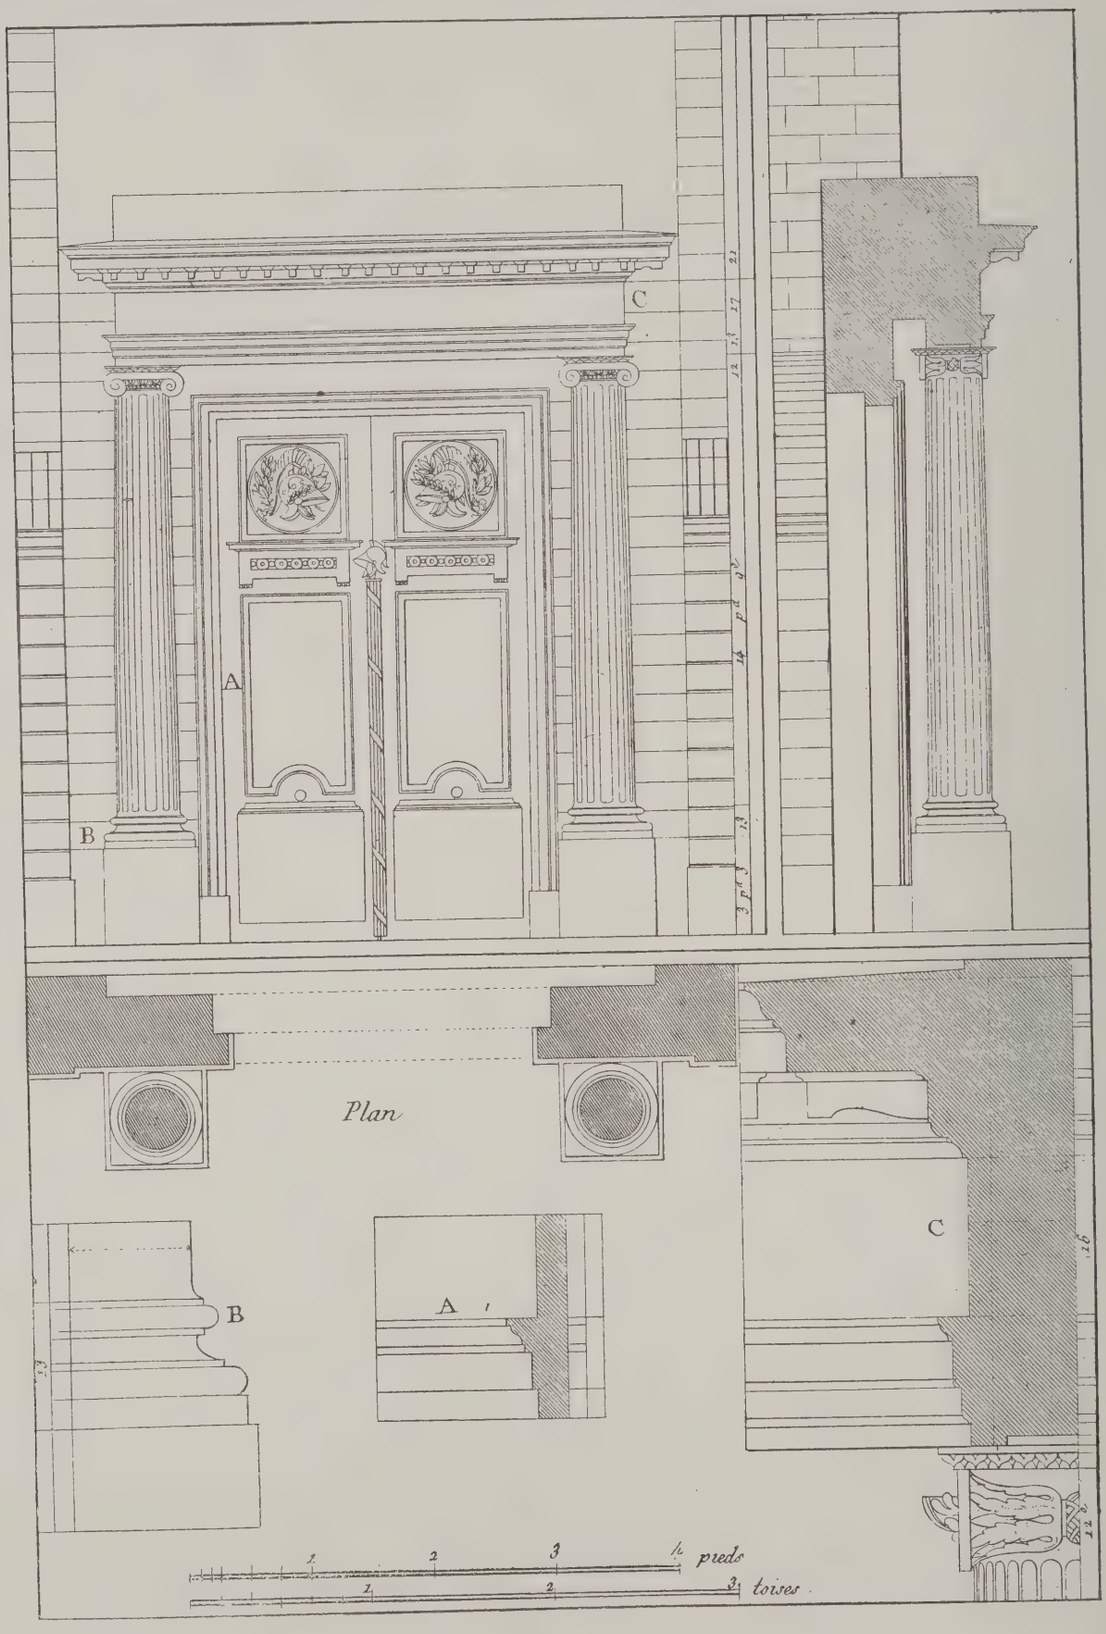
These cottages are in course of erection at Willington-on-Tyne on the estate of the Newcastle Corporation, which has recently been laid out by them on Garden City lines.

Twenty cottages are to be now built, each pair different in design. Every cottage will have about 400 yds. of garden ground, and the 20 are arranged in a square, so that all the gardens are in the centre. The builder is Mr. T. R. Bell, of North Shields, and the architect W. J. Fleming Davidson, of Willington Quay and Newcastle.

Our Plate.

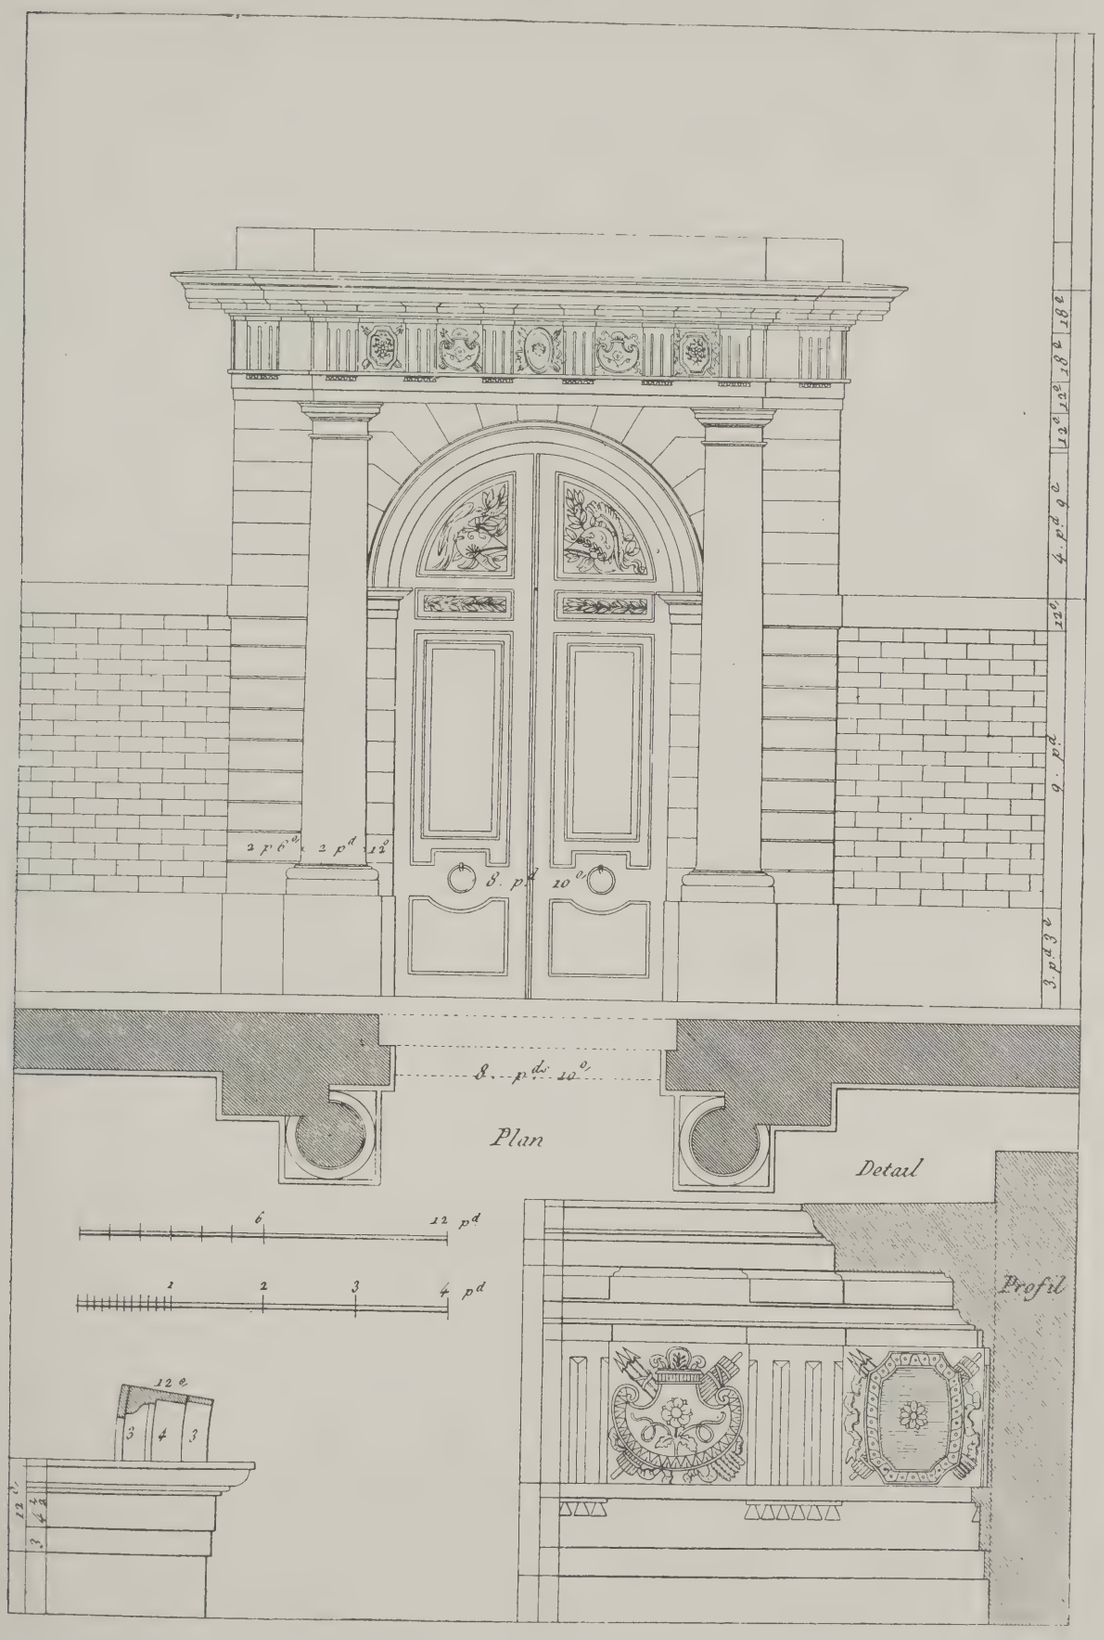
Old Portes-Cocheres in Paris.

Of the same First Empire character as the example given in our issue for July 15th, we publish as a centre plate this week two more portes-cochere in Paris—in the Rue de Grenelle and the Rue de l'Université, respectively. They are both good examples of design, well proportioned, and delicate in the scheme of their ornament. The illustrations are themselves fully detailed, and consequently do not call for extended description here.



Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

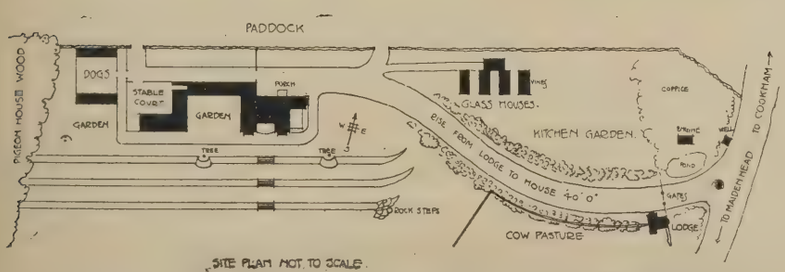


Free £500 Accident Insurance Coupons have been sent to the following:—

A. H. (London, E.C.), G. A. B. (Barry), L. C. (Halifax), E. A. S. (Oxted), A. M. (Hanwell), G. A. S. A. (Blackburn), E. M. L. (Devonport), W. S. J. (Streatham), J. D. (Wakefield), A. J. (East Croydon), T. J. G. (Norwich), G. F. K. (Chesterfield), T. C. S. (Dundee), E. J. B. (Shaftesbury), R. A. H. P. (Devizes), J. G. H. (Ilkeston), W. J. (Newport, Mon.), W. B. (Kirkby Lonsdale), J. E. (Dublin), J. R. (Pyle), P. L. (Gloucester), J. B. H. (Kilburn).

BISHOPSGATE STREET TO BE WIDENED.—At last week's meeting of the Court of Common Council, on the recommendation of the Improvements and Finance Committee, it was decided to widen Bishopsgate Street to 70ft. between Angel Alley and the City boundary, at a cost of £313,900. The London County Council had agreed to contribute one-half the expense in consideration of the Corporation not offering any opposition to the construction of a tramway from the City boundary to Middlesex Street.

PORTE COCHÈRE, RUE DE GRENELLE F. ST. GERMAIN, PARIS.



PORTE COCHÈRE, RUE DE L'UNIVERSITÉ, PARIS.

Entrance Front.

Garden Front.

SITE PLAN NOT TO SCALE.

"HARWOOD," COOKHAM DEAN. SULLIVAN AND SULLIVAN, ARCHITECTS.

This house has been built in the centre of about 56 acres of ground, and occupies a commanding position on Mount Hill, one of the highest points in Berkshire. It faces south, overlooking the surrounding country to the Surrey hills, with Windsor Castle and Clieveden Woods in the middle distance. The approach is by means of a winding drive from the Maidenhead road. On the left of the entrance gates is the gardener's lodge from where there is a rise of about 40 ft. up to the house. The hall, staircase, and corridor of the house are all panelled and floored in oak, while the dining-room and drawing-room are panelled in deal, with oak floors. The kitchen, offices and dairy are to the north, forming, with the stables to the west, an enclosed garden. The stabling is arranged to accommodate five horses. The coachman's quarters are placed over the coach-house and harness room. To the west of the stables there are kennels for about forty dogs. The general contractors for the work were Messrs. Patman and Fotheringham, Ltd. The stable fittings are by Messrs. Musgrave & Co.; sanitary fittings, plumbing and pumping by Messrs. Dent & Hellyer; Broseley roof tiling by Messrs. E. & C. Braby; wrought-iron gates and glazing by Messrs. Wainwright & Waring; wrought-iron work, locks and weathercock by Messrs. Hart, Son, Peard & Co.; ranges by the Eagle Range Co.; fireplaces by the Teale Fireplace Co.; and the wood carving by Mr. J. Seglie—all of London. The glass-houses are by Messrs. Crompton & Fawkes, of Chelmsford. The bricks from Messrs. Thomas Lawrence & Son, of Bracknell.

Views and Reviews.

Weighty Affairs of Estate.

The portly and prosperous-looking volume which has for its short title "The Estate Book" contains much that is interesting and valuable to those who are concerned in estate management. There are, for example, articles on the construction and maintenance of roads, on the rights of property in land, on forestry and the cost of tree-planting, on estate engineering, and on week-end cottages. In the article last-mentioned (which is illustrated with several folding plates) the author commits himself to the recklessly speculative statement that "when (a week-end cottage is) provided with a fireplace, and fires are lighted in it during the winter months, it will tend to keep the house warm, and will certainly add to its cheerfulness." Well, we live and learn; and it is not always possible to avoid these highly technical details; but has the author duly considered their possibly paralysing effect on the bucolic mind?

The Country Gentlemen's Estate Book, 1908 (The Year Book of the Country Gentlemen's Association), edited and compiled by William Broomhall. London: The Country Gentlemen's Association, Ltd.

Yorkshire Vales and Wolds and Buildings.

Mr. Gordon Home, whose excellent sketches of Yorkshire vales and wolds have been worthily reproduced in the best style of the three-colour process of printing, is by no means a blind worshipper of the scenes and buildings he depicts and describes. His natural tendency to praise the objects he has selected for attention is often tempered with criticism that is always discriminating and sometimes caustic. Hence, with respect to Beverley Minster, while confessing that, in his opinion, no towers that he has seen in this country compare with Beverley for the masterly way in which they "combine continuous lines and rectangular ornaments with the most exquisite grace and dignity," he does not hesitate to express his disapproval of the Early English chancel and transepts, which, he considers, suffer loss of dignity by lack of proportion. The book is for the general reader, but, as was inevitable in a book dealing with a district (including York, Sheffield, Hull, and Leeds) that is prolific in minsters and abbeys and castles and halls, contains many pictures and much comment that are of architectural interest. Mr. Gordon Home is certainly a past-master in the gentle art of producing books in which the pictures are beautiful and the gossip is agreeable.

"Yorkshire Vales and Wolds." Painted and described by Gordon Home. London: A. and C. Black. Price 7s. 6d. net.

Electrical Measuring Instruments.

That there should be any subject under the sun about which no book has been written would be rather surprising. Yet the author of "Industrial Electrical Measuring Instruments" seems to have had the good fortune to hit upon such a subject, and he may be congratulated not only on his enjoyment of a rare monopoly, but on the excellent use he has made of it in producing what seems to us to be a good practical treatise by a competent writer. It explains to the non-mathematician the construction and working of the various types of electrical measuring instruments, and gives hints as to their selection and maintenance; and, since "science is measurement," the author, in dealing with the various instruments for indicating, recording, and integrating, naturally introduces a great

deal of information which, while subsidiary to the main purpose of the book, is nevertheless valuable. The volume is abundantly illustrated.

"Industrial Electrical Measuring Instruments." By Kenelm Edgcumbe, A.M.Inst.C.E., M.I.E.E. London: Archibald Constable and Co., 10, Orange Street Leicester Square, W.C. Price 8s. net.

Bankruptcies.

During the week ended July 17th, twenty failures in the building and timber trades of England and Wales were gazetted.

C. Haynes, builder, Clacton. Adj., July 17.

Ridal and Wincott, builders, Ashby. R.O., July 15.

F. Taylor, joiner and builder, Manchester. R.O. July 17.

W. Stubbs, builder, London and Southend-on-Sea. Adj., July 16.

E. B. Hayward, builder, Worthing. Liabilities, £1,435; assets, £28.

J. E. B. James, builder and plumber, Bristol. Liabilities £1,450; assets, £542.

S. Warburton, builder and contractor, Miles Platting, Manchester. R.O., July 10.

H. J. Harding, builder, Bideford. P.E., Guildhall, Barnstaple, July 28, at 3.30.

G. B. Andrews, builder, Ivybridge. P.E., Town Hall, East Stonehouse, August 6, at 12.

H. C. Foulkes, builder, London, E.C. P.E., Bankruptcy Court, September 8, at 11.30.

T. W. Cletheroe, carpenter, formerly builder, Weybourne. Liabilities, £172; assets, nil.

H. Bray, surveyor, Putney. R.O., July 14. P.E., Bankruptcy Court, London, September 8, at 11.

E. Tabor, contractor, Cambridge. Gross liabilities, £4,947; £3,747 expected to rank; assets, nil.

C. Duckhouse, heating engineer, Smethwick. P.E., Law Courts, West Bromwich, August 14, at 10.30.

A. Northcott, plumber and gasfitter, Penygraig. R.O., July 13. P.E., C.C., Pontypridd, July 28, at 10.15.

E. Bowdler, builder, Shrewsbury. Liabilities, £201; expected to rank, £199; assets, £42; deficiency, £157.

C. Wilcox, galvanised iron merchant, Smethwick. P.E., Law Courts, West Bromwich, August 14, at 10.30.

T. H. Tucker, painter and paperhanger, Luddenden Foot. R.O., July 14. P.E., C.C., Halifax, July 31, at 2.

F. Britton, builder and contractor, London, W.C. R.O., June 16. P.E., Bankruptcy Court, September 8, at 11.

J. Thompson, architect and surveyor, Kendal. Gross liabilities, £5,838; £271 expected to rank for dividend; assets £35; deficiency, £240.

H. Watson, builder and contractor, Peterborough. Liabilities expected to rank for dividend, £3,023; assets, £3,516; estimated surplus £493.

T. Waite, plumber and painter, Kidsgrove. R.O., July 14. First meeting, O.R.'s, Newcastle, July 30, at 12. P.E., Town Hall, Hanley, August 26, at 11.

M. Lewis, builder and contractor, Ystabyfera. R.O., July 13. First meeting, O.R.'s, Swansea, August 1, at 11. P.E., Town Hall, Neath, August 11, at 11.30.

A. T. Huss, timber merchant, North Shields, R.O., July 13. First meeting, O.R.'s, Newcastle-on-Tyne, July 31, at 11. P.E., C.C., Newcastle, August 20, at 11.

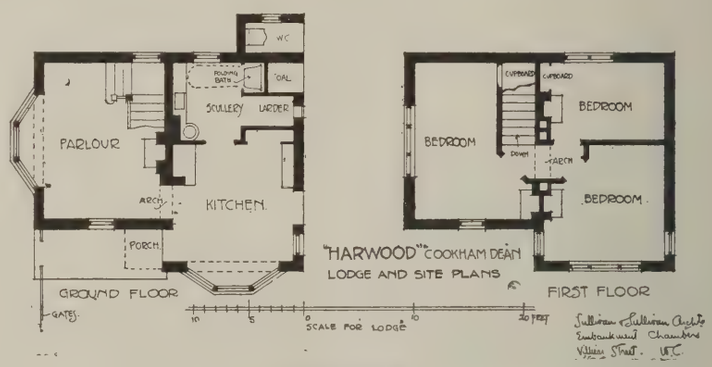
Nicholls and James, builders, Upper Caterham. R.O., July 15. First meeting, 132, York Road, London, S.E., July 31, at 11.30. P.E., C.C., Croydon, August 13, at 11.

W. Bettridge and Son, smiths and engineers, Chelsea and Parson's Green. R.O., July 14. First meeting, Bankruptcy Court, July 30, at 12. P.E., same, September 8, at 11.30.

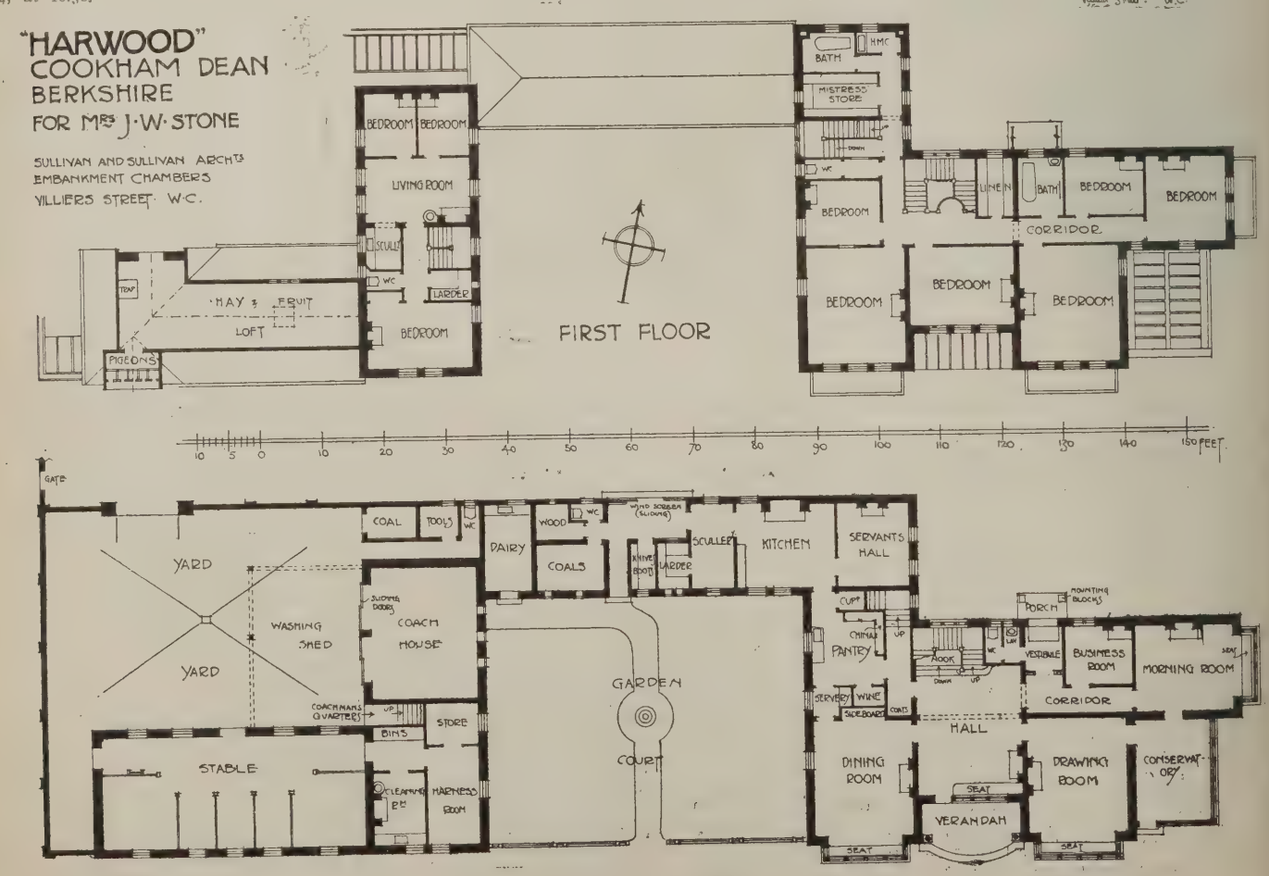
G. Race (trading as Geo. Race and Sons), builder, Stockton-on-Tees. First meeting, O.R.'s, Middlesbrough, July 22, at 11.30. P.E., C.C., Stockton-on-Tees, July 29, at 10.30. Adj., July 8.

New Companies.

Essex Builders' Supply Association, Ltd., to take over the business of a builders' merchant carried on by W. J. Hart, of 174, Midland Arches, Leyton. Registered office, 48, Leadenhall Street, E.C.



Natal Premier Portland Cement Co., Ltd., to adopt an agreement with the Brakfontein Concessions Syndicate, Ltd., for the acquisition of the property, rights, benefits, and privileges referred to therein, and to carry on the business of manufacturers of and dealers in cement, lime, plaster of Paris, and whiting, etc. Capital: £130,000. Registered office: 8, Duke Street, Adelphi, W.C.



Courtney, Pope and Co., Ltd., to acquire the business of a builder, decorator and shopfitter carried on by W. J. Sumner as Sumner and Co. at 6-9, Alpha Place, London, N. Capital £5,000. Registered office, 5, Alpha Place, Caledonian Road, N.

St. Helens Manufacturing Co., Ltd., to manufacture and deal in oxides of iron and other pigments, paints, oils, etc. The first directors are: W. J. Wigg, T. Hall Sissons, F. J. Norman, and A. T. Hall. Capital: £10,000.

PARTNERSHIP DISSOLVED.

Hovenden and Barber, architects and surveyors, 30, Bishopsgate Street Without. Dissolved as and from June 20, by mutual consent. Debts due to and owing by the firm will be received and paid by Henry Edward Hovenden.

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

Concrete and Fire-Resistance. On another page we record the first meeting of the Council of the Concrete Institute. It may be expected that this Institute will have considerable influence on fire prevention, for there is no material which has made greater headway in the direction of true fire prevention than concrete, both plain and reinforced. Some doubts have, of course, been raised of late as to the value of certain of the concrete aggregates, so far as the lasting power of reinforced concrete is concerned, and, notably, the use of coke-breeze has been discussed. There can be no doubt, however, that coke-breeze concrete provides an excellent fire-resistant, and that where the coke-breeze has been carefully selected, *i.e.*, not having too much sulphur in it, nothing of a detrimental character has resulted, so far as metalwork is concerned. What architects should be careful about is not to use coke-breeze that is sulphurous. The presence of sulphur up to 1 to 1½ per cent. will probably do no harm, but when there is from 3 to 4 per cent. of sulphur present, it may have a serious effect on the metalwork. Architects should also be particularly careful not to use pan-breeze. It is pan-breeze which has been the cause of complaint in Germany, not the coke-breeze as generally understood in this country. It is time that a little more care should be taken by the producers of coke-breeze to discriminate between pan-breeze and coke-breeze, and it would also be as well if they took a little more care as to the cleanliness of their coke-breeze heaps.

The Tube Fire. In view of the popular use to which the various underground tube railways are being put, the fire which occurred recently near Moorgate Street station has certainly been disturbing, for it has brought vividly before us once again the risks of fire on some of the older tube lines. The line on which this fire occurred is one of the pioneer "tubes," and thus cannot be expected to possess as perfect an equipment as could be desired; nevertheless, considerable improvements have been made on the older lines, and it is to be hoped that this recent warning will lead to yet further improvements. Among the alterations we would most strongly advocate is the gradual but complete removal of all inflammable material on the tube lines and at their stations, and included in such material is the timber used for the railway sleepers. There is not the least reason, either, why such structures as signal-boxes should not also be of non-combustible material, i.e., of metal or of a combination of metal and concrete. There is, also, not the least reason why the present wooden railway sleepers should not be gradually replaced by concrete or reinforced concrete sleepers: such sleepers are being used both on the Continent and in the United States. We think it would be unreasonable to compel the company to make its changes forthwith, but changes as indicated should certainly be undertaken within a limited period, say, three or, at the most, five years.

Fire Losses in Cotton Mills. Most cotton mills are now protected with automatic sprinklers, and, as a writer points out in the "Journal of the Royal Society of Arts," the damage caused by fire is often small as compared with that occasioned by water. The majority of fires originate in the spinning frames in the upper storeys of the mills, the carding machines being placed on the ground floor, so that the cards are often deluged with water distributed by the automatic sprinklers or other fire appliances. Even where the mills are supposed to be fireproof, much water has been known to find its way through the concrete floorings into the lower rooms. The card clothing is very susceptible to injury by water owing to the difficulty of removing the effects of damp from the wire teeth. Considerable salvage can be effected from prompt attention to most of the machinery, but the cards are usually abandoned as a total loss, there being no method of removing the effects of damp from the wire teeth. If only some inventor could devise such a method, the fire loss in cotton and woollen spinning mills would be considerably minimised.

Causes of Electrical Fires. Many electrical fires are caused from employing non-trained labour to install temporary work, and by the carelessness of plumbers, carpenters, and other mechanics, who in this way often undo the work that has been well and safely done by those who installed the system. The following is an instance of the mischief resulting from such bad work on the part of a gas-fitter: In a large warehouse the electric wires had been well installed, and shortly afterwards the gas-fitter came in and fixed a gas-pipe that touched the insulation of one of the wires. During a severe thunderstorm, following a very vivid flash of lightning, a flame was seen at the point where the gas pipe crossed the electric-lighting wire. When the fire inspector arrived, it was learned that the lightning had melted a hole in the gas-pipe, setting fire to the escaping gas. Fortunately, the outbreak occurred in the daytime, when it was at once discovered; but had it not been determined who was to blame, the fire would have been credited to defective wiring. To show what mischief may be wrought by the work of the amateur or the handy-man around the premises, the following instances may be quoted: A window-dresser had been decorating a show-window, and, having no light, had installed a temporary cord, tapping it to some wires nailed down with double-pointed tacks to the floor of the window, and used to supply current to twenty-four (8 c.p.) lights. This one light was of 32 c.p. capacity, and was being used as a portable light. The window-dresser left the window for a few minutes, carelessly leaving the lamp on a wax figure, which was covered with drapery. When he returned he found the figure in flames. The damage done was about £200. Another window-dresser attempted to utilise a star, the outline of which was made with incandescent lights, by connecting it to a socket in the window-fixture, using for conductors between the plug and star ordinary cotton-covered magnet-wire. He also attempted to install a few extra lamps, the lamps to be fastened to and partially enclosed by paper flowers. Having no extra sockets, he soldered his wires directly to contact-pieces on the butt of the lamps. A short circuit resulted; the goods in the window were ignited; and before the window-dresser (who was in the window at the time) could get out, he was so badly burned as to necessitate his removal to the hospital. Statistics show that only a very small percentage of fires are caused by electricity, and that most of these are due to defective work or fittings.

The Berlin Opera House Fire. Extended reference has recently been made in the daily press to a fire which occurred at the Royal Opera House, Berlin. As a matter of fact, however, the fire was only a comparatively small one, although here again evidence was afforded of how modern precautions result in the limitation of a fire. In this particular instance the fire occurred in a very old building, which has seen many alterations and changes; but during the last few years these alterations have been, to a great extent, improvements from the fire point of view. The cause of the fire, as is only too customary, was that of negligence, and what is more the negligence of a builder's workman who was apparently doing a plumber's job.

Fire Tests. We deal elsewhere with a report by the British Fire Prevention Committee on one of the dry-powder fire extinguishers, and it is interesting to observe that the Committee is now undertaking a series of tests with plain water as applied with ordinary buckets. The report on these bucket tests seems likely to be useful reading, and the comparisons should be highly interesting, such tests being of considerable general utility. Another subject which the Committee has been taking up of late is that of the non-flammability of textiles. There is no doubt that a considerable number of fires are caused by swinging gas burners setting light to gauze or muslin curtains. If a simple means of impregnating curtains could be found, the large number of fires which occur in domestic dwellings would be much reduced.

Vents in Fire Doors. At a recent meeting of the National Fire Protection Association of America, one of the subjects under discussion was that of improving the present type of armoured door used in the United States. With a view to preventing the gases generated by the woodwork in armoured doors when subjected to heat, it has been proposed by the chairman of the Committee on Coverings to Windows and Door Openings that openings should be provided in the covering of the tin-clad doors on that side which would probably be the least subjected to the fire, these openings being furnished as a means for the escape of the gases generated in doors of this type when exposed to high temperatures for a considerable length of time.

It is considered that a 3in. opening would be about sufficient for reasonably small doors, but that larger vents will be found necessary for doors exceeding 54 ft. super. This suggestion has been made as the result of tests conducted at the Underwriters' laboratories. It was shown in these tests that where no special vent was provided, and where the chafing strips were not bolted through the door, the swelling of the covering has been as great as 18 ins. Further tests may be expected, but the rule as to vent openings in these doors will shortly be enforced by the fire underwriters in the States.

Fires from Petroleum Spirit.

So many fires have been occurring of late in places where dry-cleaning is being undertaken, not only in fully-organised factories, but in private premises, that it is interesting to observe that the London County Council has now issued a statement on the subject, and that some amendments in legislation may be expected. The statement is as follows:—"We reported on November 12th, 1907, with reference to the urgent need for the amendment of the Petroleum Acts, 1871 to 1881, especially in view of the grave dangers attendant on the use of petroleum spirit for cleaning purposes in private houses and small shops. The attention of the Secretary of State for the Home Department was directed to the question, but, as stated in our report on January 21st, 1908, he intimated his approval of the steps which were being taken by the Council for the enforcement of the existing law, but could not see his way at the time to initiate fresh legislation on the subject. Since that date further evidence has come to our notice of the need for more effective steps being taken in the matter. One danger arising from the domestic use of petroleum spirit is that after the spirit has been used it is often thrown away into the drains, and in some cases in sufficient quantities to cause serious accidents in the drains or sewers."

THE CONCRETE INSTITUTE

First Meeting of the Council.

The first meeting of the Council of the newly-formed Concrete Institute was held in London on July 21st, the president (the Earl of Plymouth, C.B.) presiding.

Prior to the meeting there was a luncheon of the Council at the Ritz Hotel to meet the president, at which the chairman of the Executive, Mr. Edwin O. Sachs, F.R.S.Ed., presided. Among those present were Mr. Ernest George (president of the Royal Institute of British Architects), Sir Henry Tanner, I.S.O., of H.M. Office of Works (vice-president), Mr. W. H. Johnson, B.Sc. (hon. secretary of the Institute of Metals), Mr. Searles-Wood, F.R.I.B.A. (hon. secretary of the Reinforced Concrete Committee), Mr. Max Clarke, F.R.I.B.A. (chairman of the Specification Committee of the Commission on Concrete Aggregates), Mr. Ellis Marsland (hon. secretary of the British Fire Prevention Committee), Mr. Ross, M.Inst.C.E. (Chief Engineer to the Great Northern Railway), Mr. Marsh, M.Inst.C.E. (Metropolitan Water Board), Mr. William Dunn, F.R.I.B.A., Mr. Hatch (Chief Engineer to the Metropolitan Asylums Board); Mr. Colson, M.Inst.C.E. (Admiralty), Lt.-Col. Winn, R.E., Mr. de Vesian, M.Inst.C.E., Mr. W. H. Topham, A.M.Inst.C.E., Mr. E. P. Wells, J.P., Mr. Bertram Blount, F.I.C., Mr. Workman, C.E., Mr. Seraillier, Mr. Munro, Mr. Purton, etc. After the loyal toast had been given, the toast of "The President" was proposed by Mr. Sachs, who dealt with the objects of the Institute and the necessity of thorough research work in matters appertaining to concrete and reinforced concrete. He pointed out that the membership already exceeded 225, of whom the majority were civil engineers and architects, but that co-operation with the representatives of the industries concerned was essential in order to obtain practical results. The Earl of Plymouth, in reply, referred to the necessity of considering the architectural rendering of structures in reinforced concrete, so that the aspect of our cities may not be spoilt. Mr. Ernest George proposed the success of the Institute, coupled with the name of Sir Henry Tanner, who, in reply, dealt with the necessity of architects and civil engineers doing their own designing in reinforced concrete.

FIRE INQUESTS IN THE CITY.

The utility of fire inquests as required within the precincts of the City of London has been frequently referred to in these columns, and it is to be hoped that some day the private Bill before Parliament suggesting the universal adoption of the fire inquests throughout Great Britain will become law.

We have now before us the report of last year's working of the fire inquests in the City conducted by Dr. Waldo.

Dr. Waldo reports that 145 fires had been officially notified to him during the year, as against 122 in 1906, and he had fully and carefully enquired into the cause and circumstances of each with the assistance of the police and his officers. There had also been inquests into eight non-fatal fires. Altogether he had enquired into the cause of 637 deaths and non-fatal fires.

Dr. Waldo says:—"I have continued to devote a considerable portion of my time and energies to the important subject of fire enquiries within the City, including a personal investigation on the spot of the fires reported to me. This system of personal investigation at the site of each fire has been the means of preventing the overlooking of any case of fire which should be publicly enquired into, whilst at the same time the cause of many fires has thereby been ascertained and unnecessary inquests prevented. Of the 145 fires reported, in 115 cases the cause of the fire was determined, and in only 30 fires does the cause still remain unknown. I have referred eleven fires, seven of which were reported to me as electrical in origin, to Mr. Voysey, the City Electrical Engineer, and as a result of his expert investigation five of the number were found to be due to defective electrical arrangements.

Continuing, he says:—

"In the course of my fire enquiries many suggestions have been made and put into practice by owners and occupiers with a view to future saving of life and property. As you are doubtless aware, the City of London Fire Inquests Act is confined to my jurisdiction in the City of London only, and I think the time has now arrived when the powers under this local Act might usefully be extended to my other jurisdiction in the borough of Southwark. Non-fatal fires, especially dockside fires, are both serious and frequent in Southwark, and in the absence of any judicial inquiry the causes often remain unknown."

FIRE PROTECTION IN SCHOOLS.

It would appear that special precautions should be taken in laboratories connected with schools, and this matter should have the attention of architects who undertake work for school authorities.

Fire protection in laboratories and science rooms especially demands attention.

This matter came up at last week's meeting of the London County Council, when the Buildings Sub-Committee reported as follows:—

"We have now had under consideration the question of the prevention of fires in laboratories and science rooms, and we have taken the opportunity of revising the existing regulations on the subject set out in section (*c*) of article 114 of the Provisional School Management Code. The amendments or additions proposed by us are indicated in italics. We are of opinion that the revised regulations should be printed in large type, mounted on cardboard, and supplied to each L.C.C. and non-provided school possessing a laboratory or science room, and that a notice should be inserted in the 'London County Council Gazette' drawing the attention of head teachers to the precautions to be observed in laboratories and science rooms to prevent danger from fire. We have communicated with the Buildings Sub Committee on the matter and they have informed us that they concur in the foregoing proposals, and that they propose that all chemical laboratories and the cupboards in other rooms in Council's schools where chemistry is taught shall be treated with fire-proofing solution, and buckets of sand provided. In this connection we have asked the Buildings Sub-Committee to arrange for the chemical cupboards in non-provided schools to be similarly treated to those in Council's schools. We recommend:—

"That the undermentioned regulations for the prevention of fire in laboratories and science rooms be printed in large type, mounted on cardboard, and supplied to each L.C.C. and non-provided school possessing a laboratory or science rooms—

Regulations for the Prevention of Fire in Laboratories and Science Rooms.

(1) When the laboratory is in use an adult teacher must always be in charge.

(2) In laboratories which are used on by day scholars, the head master or headmistress must have the custody of the key, which must not be left finally in the possession of the laboratory monitor after the close of the school;

(3) When there are evening classes a second key is provided, which must be in the custody of the responsible teacher;

(4) The person in charge, at the time of leaving, must satisfy himself that all taps are turned off;

(5) Charcoal that has been heated must be placed in galvanised sheet iron boxes *which must always be closed when not in use, and which should be mounted on asbestos or stone slabs*;

(6) No unauthorised person must be permitted to enter the laboratory when it is not in use;

(7) The receiver of the waste from the sinks must be carefully cleaned out at least once a week;

(8) Inflammable liquids (such as wash alcohol, methylated spirits, ether) must not be poured down the sinks;

(9) Very great care must be taken when using *sodium potassium*, or *phosphorus* (or when cleaning out bottles which have

contained these substances) to avoid dropping and losing small pieces about the laboratory;

(10) *Sodium, potassium,* and *phosphorus* must not be kept with other chemicals in the laboratory, but must be in the custody of the head teacher, who is responsible for keeping them in a locked compartment, of which he alone must retain the key. *Special lockers are supplied for this purpose*;

(11) When evening classes are held in the same laboratory, another supply of these materials must be similarly retained in the custody of the evening school teacher;

(12) *All bottles containing dangerous chemicals should be distinctly marked.*

(13) The schoolkeeper must make a round of inspection every night after work is over in the laboratory, in order to make certain that *all* taps are turned off, and that there is no danger of fire.

(14) *For the prompt treatment of burns and acid wounds a bottle of carron oil should be kept ready for use in each laboratory or science room.*

N.B.—These regulations are to be hung in a conspicuous place in the laboratory.

(The foregoing recommendations were agreed to by the Council.)

TESTS WITH FIRE EXTINGUISHERS

The British Fire Prevention Committee has now issued its report on one of the powder fire extinguishers, known as the "Diamond Powder Extinguisher." Much of the matter contained in the report is of technical interest to architects and surveyors, who have to specify extinguishers in connection with the equipment of buildings.

The preamble to the report, which is signed by Mr. Percy Collins, J.P., reads as follows:—

"The series of tests with the 'Diamond' Dry Powder extinguisher showed that hand powder fire extinguishers, as a class, if applied with skill, can often be usefully employed in the incipient stages of small fires. If a small fire has obtained such proportions that it cannot be extinguished by a number of hand powder fire extinguishers, they may still be useful to keep it in check until other fire appliances can be brought into play—this applies especially to loose material.

"The various tests undertaken with petrol point to the conclusion that, with a volatile liquid of this nature giving off a highly inflammable vapour, the powder extinguisher is only efficient when the area of the fire is small or narrow.

"The efficiency of powder extinguishers depends materially on the closeness of range, the position of the operator's shoulder, and on a certain knack or dexterity in handling the appliance.

"The action of powder extinguishers would appear to be largely mechanical."

This bears out very much what we have already indicated as to powder extinguishers generally in previous issues.

Upon analysing the report with a view to ascertaining what is meant by having "a sufficient number of extinguishers," it is to be observed that on some tests as many as 10, 12, 14, 15, 18, and 26 extinguishers had to be used, whilst in one instance the Committee apparently lost count, and put down the word "numerous."

Powder extinguishers, as a rule, we believe, cost somewhere about 5s. each; thus a fire requiring 26 extinguishers would necessitate an expenditure of £7 10s. in extinguishers, and one would have to be sure that that number was within reach.

We believe that chemical liquid extinguishers cost somewhere between £2 10s. and £3, and we think ordinary buckets containing two gallons of water cost on an average 1s. 6d. each.

It will certainly be a matter of considerable interest at a later date to see a comparison of the results of identical tests as between buckets, liquid fire extinguishers, and powder fire extinguishers. Buckets were under test last week, when there was an influential attendance of the Committee at the Regent's Park Testing Station, a most interesting series of tests with ordinary buckets and plain water being undertaken.

The sub-committee in charge of the powder tests comprised Mr. Collins, J.P., Mr. Ellis Marsland (district surveyor), Mr. James Sheppard (insurance surveyor), Mr. Herbert Dyer (vice-president of the National Fire Brigades Union), and Capt. Henderson (chief officer, Rickmansworth Fire Brigade).

MODERN PRACTICE IN TALL CHIMNEY CONSTRUCTION.

By Hector St. G. Robinson.

Whatever may be the opinion of mechanical engineers as to the relative merits of chimney and mechanical draught for supplying air for the combustion of fuel, the fact remains that there is still a considerable demand for tall chimneys, and while this demand exists architects and engineers will be called upon to design and erect such structures.

Briefly, chimneys are constructed for a two-fold purpose: (1) to cause a sufficient flow of air or draught through the furnace to maintain the perfect combustion of a fuel with the least waste of heat, and (2) to discharge to a great height the hot gases which, by reason of the noxious products contained, would be very injurious if ejected at a low altitude.

Draught is caused by a difference in density between the chimney gases and the external air, the intensity varying nearly as the product of the height into the difference of temperature, being independent of the area of the chimney, and being equal to from 0 to 2 inches of water in ordinary practice. The area of the chimney flue is governed by the volume of gases to be dealt with.

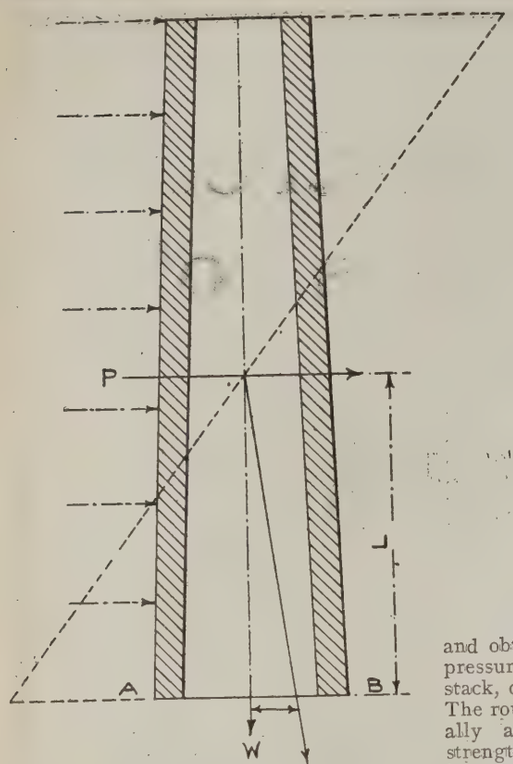
There are many well-known formulæ for the calculation of the power of chimneys, a full discussion of which would entail more space than this article warrants. The accompanying table, which can be used as a guide in estimating the dimensions required, gives sufficient examples of the more general cases met with in steam-boiler practice. The values given are believed to be ample for all cases in which the draught areas through the boiler flues and connections are sufficient.

The basis of calculation is as follows:—Fuel, bituminous coal, barometer 14.7 lbs. per sq. in., temperature of outside air 60 degs. Fahr., chimney gases 500 degs. Fahr., the grate surface having 40 per cent. effective area of opening.

Experiments and tests have shown that of all forms a round parallel flue is the best, though it may be smaller at the top without detriment owing to the fact that the gases, cooling down, contract in volume, and therefore require less space. A round flue has less retarding effect on the ascending gases than a square one. Connecting flues should be as direct as possible, and should not have sharp bends, with about 20 per cent. greater area than the chimney area, or a considerable drop in draught pressure will result.

Allowances for Wind-Pressure.

Wind-pressure is usually the only external force to be provided against. As regards stability, the best form of section for a chimney is the circular; next, the octagonal; and, lastly, the square form. When a solid body is presented to the wind, the front pressure is modified if the face of the body is not plane. For round and octagonal chimneys the wind-pressure is usually calculated upon two-thirds and three-quarters respectively of their area projected on a vertical plane. Some authorities give values for the pressure co-efficient as low as one-half for the round and three-fifths for the octagonal form.



The maximum pressure used in calculation varies considerably. Fifty years ago Rankine gave 50 lbs. per sq. ft. as the highest recorded pressure in this country, and the data collected by the Board of Trade Committee on the Tay Bridge enquiry show that on pressure plate anemometers at Birmingham pressures of 20 to 27 lbs. per sq. ft. had been recorded, at Edinburgh pressures of 20 to 25 lbs. per sq. ft., at Glasgow pressures of 30 to 47 lbs. per sq. ft., and at Greenwich 30 to 40 lbs., per sq. ft.

In Germany chimneys inland are calculated on a wind-pressure of not less than 25 lbs. per sq. ft., and 40 lbs. on the sea coast; in Austria, generally 30 lbs. per sq. ft.; while the big chimneys at the Paris Exhibition, 230 to 260 ft. in height, and $14\frac{3}{4}$ ft. inside diameter at top, were calculated for no less than 55 lbs. per sq. ft.

Numerous experiments show, as might be expected, that the wind velocity, and, therefore, the wind pressure also, is greater as the height is greater. This fact led Professor Land, a member of the German Commission for drafting rules for the construction and dimensions of factory chimneys, to consider that the wind-pressure per unit of area on chimneys should be reckoned to increase with the height H

above the ground according to the formula.

$$(Ph = Po \div 16\ H)$$

where Po is the wind-pressure at the bottom and Ph at the height H feet up. For the pressure per sq. ft. at the bottom he takes 25 lbs. for inland places, 30 lbs. for those particularly exposed, and 35 lbs. on the coast. Though lower pressures may be admissible for calculating other lofty buildings, nothing less than the maxima here given can be allowed for chimneys, owing to the small breadth of surface exposed to the wind, for the investigations on wind-pressure in connection with the Forth Bridge showed that the pressure per unit of area is greater on small surfaces than on large, although later experiments by Dr. T. E. Stanton, M.Inst.C.E., at the National Physical Laboratory, appear to disprove the accuracy of this.

Of the various types of chimneys, the following are, in their order, the most common: Ordinary brick, radial and shaped brick, wrought iron and steel, plain concrete, reinforced concrete, and reinforced tile and concrete.

Brick Chimneys.

Brick chimneys have become to be regarded as the standard form of construction in this country, but the superior merits of reinforced concrete are beginning to assert themselves.

The construction of brick chimneys is largely based on experience, and the many empirical rules as to thickness usually give results which err on the side of safety, the following rule given by the London Building Act being a case in point:—

The thickness of the walls should be 8½ ins. down to a distance of 20 ft. from the top, with a half-brick addition for every further 20 ft. downwards.

The half-brick addition every 20ft. is extravagant, and, if this figure were increased to 30 ft., in round and octagonal chimneys a reasonable factor of safety would still exist.

It is generally advisable to investigate

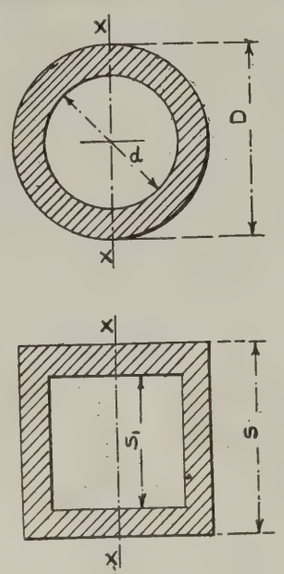

FIG. 1.

and obtain the stresses induced by wind-pressures, having due regard to shape of stack, quality of materials, and exposure. The round and octagonal forms are generally adopted as combining maximum strength with a minimum of complication in construction. A square pedestal with a round or octagonal shaft is extremely staple, the square pedestal being usually from one-fifth to one-tenth the height. Stock bricks built in English bond with a better-class brick for quoins and strings are usual. Round shafts are frequently built of radial bricks, but a radial solid brick is hardly a necessity, except for small shafts. Radial perforated bricks of the Custodis type are a great improvement on ordinary bricks for chimney construction, and should be adopted for all first-class work. These are a specially-made brick, and are stated to have a compressive strength of about 5,000lb. per sq. in., gross section.

The stress upon the rim of any transverse section of a brick chimney due to wind-pressure is the sum of the two quotients—the weight of the chimney above that section, divided by the area of the section; plus the moment of the wind-pressure divided by the section modulus. Let

W = weight above section.

A = area of section $= \frac{\pi}{4}(D_2 - d^2)$.

f = unit stress.

Z = section modulus.

$= \frac{\pi}{32}\frac{D^4 - d^4}{D}$ for a circular section (Fig. 1).

$= \frac{1}{6}\frac{S^4 - S_1^4}{S}$ for a square section (Fig. 1).

P = total wind-pressure acting through its centre of gravity.

L = lever arm *i.e.* distance of centre of gravity of wind-pressure above section.

PL = wind moment.

Then the stresses at the rim of section (Fig. 1)

$$= f = \frac{W}{A} \pm \frac{PL}{Z}$$

The distance of the resultant from the axis X X

$$= \frac{PL}{W}$$

The strength of brickwork is difficult to determine, depending as it does on the height of the chimney, the strength of the bricks and mortar, the thickness of the joints, and the excellence of the bonding.

Tensile stresses, if allowed to exist, have to be resisted by the adhesion between the bricks and mortar, which depends in a high degree upon the care exercised in building as well as the proportion of cement in the mortar.

The mixture of mortar usually employed in modern chimney construction where a high internal temperature has to be resisted has the volumetric composition of 1 part of Portland cement, 1 part lime, and 3 parts sand—*i.e.*, a 1-1-3 mixture. Experiments on the adhesion of this mortar to bricks carried out in the testing works at Charlottenburg gave the following results:— Adhesion per sq. in.

Age days.	Solid bricks.	Perforated bricks.
3	11.75	16.15
28	19.10	38.20
90	23.50	57.30

With this same mortar Professor Lang recommends the following limits of stress for any other joint at a distance D feet down from the top:—

Compression 71.1 + 0.65 D.
Tension 18.5 + 0.56 D.

These limits apply to chimneys newly built; later the work grows stronger, but thermal stresses accrue. If the gases are hotter than 480 to 570 degs. Fahr. in an unlined chimney the above limits must be lower, or the chimney must be lined.

On the leeward side of the chimney the limit of compression to which the cement mortar should be subjected ranges according to different authorities from 100 to 150 lbs. per sq. in. Notwithstanding the tension permitted by some authorities, the design should be such that the maximum wind-pressure does not overcome the initial compression on the windward side, which means that the resultant pressure should not fall nearer the rim of the section than one-quarter the diameter in round chimneys and one-sixth in square chimneys, as pointed out by Rankine. In chimneys built of perforated bricks, in which the adhesion of the mortar to the bricks is considerable, as much as 20 lbs. per sq. in. may safely be allowed. In a large circular Custodis brick chimney at Newark, N.J., U.S.A., 350 ft high, the maximum stresses in the brick work just above the base under a wind pressure of 38 lbs. per sq. ft. normal surface, or, assuming a pressure coefficient of ⅔ for the cylindrical surface, a pressure of 25 lbs. per sq. ft. of median plane, are Compression on leeward side 256 lbs. per sq. in., compression on windward side 17 lbs. per sq. in.

Temperature of Gases, and Lining.

When the temperature of the gases entering a brick chimney exceeds 500 degs Fahr. a firebrick lining laid in tempered fireclay is required, the height to which this is carried depending on the temperature. With steam boilers of average efficiency, the flue gases will be about 600 degs. Fahr. to as low as 300 degs. Fahr. if economisers are used. In some types of refuse destructors the temperature of the chimney gases will be as high as 900 degs Fahr., and if in conjunction with steam boilers about 550 degs. Fahr. In many cases much higher temperatures will have to be dealt with, especially in smelting and gas works, where temperatures up to 1,500 degs. Fahr. are usual. In such cases of great heat the lining should be carried to the top of the chimney. This, however, is sometimes done in norm

cases to increase the efficiency of the draught by providing an insulating envelope of air around the hot gases, retarding the transmission of heat from the gases to the atmosphere through the walls.

The lining has but its own weight to support and can therefore be comparatively thin. It should not be tied to or made to support the brickwork of the outer shell, but should be quite independent, so that it may expand freely and be replaced without endangering the structure. A heavy course of stonework near the top of a chimney is an excellent means of solidifying the work at this point. At the very top a cast-iron cap about ½ in. thick may be used with advantage.

Among the many forms of brick shafts that have been evolved, that shown in Fig. 2 is probably the most common modifica-

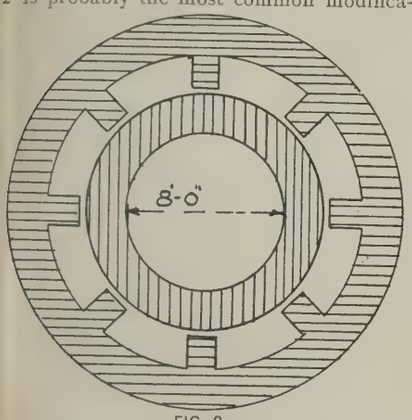

FIG. 2.

ion of the parallel shell. This type has a circular form with radial stiffening ribs projecting inwards, this greatly adding to the strength and reducing the necessary thickness of the wall.

Foundations.

In chimneys, as in other lofty structures, the foundation should receive special attention. A great deal of money is often wasted owing to an imperfect comprehension of this point. A rule that has been approved by many years of practice is to make the width of the base one-tenth the height for square, one-eleventh for octagon and one-twelfth for round chimneys, but this, like all other empirical rules, should be only adopted after investigation of all the conditions likely to affect the design. The width of the foundation slab should be governed by the bearing power of the earth, taking the maximum pressure obtained on the leeward side of the slab. The following safe bearing values represent good practice:—

Material.	Safe load per sq. ft.
Hard rock native bed	10 tons.
Clay, dry	4 to 6 tons.
Clay, moderately dry	2 to 4 tons.
Clay, soft	1 to 2 tons.
Gravel and coarse sand	8 to 10 tons.
Gravel, compact	4 to 6 tons.
Clean dry sand	2 to 4 tons.
Quicksand and alluvial soils	½ to 1 ton.

When the ground is soft and compressible the foundation should be some distance below the ground, or piles driven down to a hard stratum may be used. A considerable saving in concrete, and a consequent reduction of the dead weight, can be obtained by using some form of reinforcement such as expanded metal or one of the many patent bars now on the market. In engineering works old scrap may be to hand and can be used with advantage. Old chains and wire rope have been used in many instances.

(To be continued.)

Law Cases.

"DISEASE" AND "INJURY BY ACCIDENT" UNDER THE WORKMEN'S COMPENSATION ACT.—An interesting point in regard to the definition of an "injury by accident" was decided in the case of *Broderick* v. *The London County Council* which came before the Court of Appeal last week. The evidence showed that Broderick contracted enteritis by inhaling sewer gas while working in a sewer for the London County Council, and that the result of the enteritis was to accelerate long-existing heart disease, and to incapicitate him for work before the time at which such heart disease would otherwise have incapacitated him; but the judge of the Marylebone County Court, from which the appeal was now made, held that the contracting of enteritis in this manner was not an "injury by accident" within the meaning of the Act. The workman appealed, but the Court dismissed the appeal. The Master of the Rolls, in the course of his judgment (as reported in the "Times"), said the applicant was employed in a sewer, and his work necessarily exposed him to the risk of poisoning by sewer gas; he contracted enteritis, and it had been argued from this that this was an "injury by accident" arising out of the employment; and it was said to be accidental because it was an accident that this poison bacillus happened to attack this particular man, and that under the circumstances all the requirements of the Act had been complied with. His Lordship was not able to accept this contention. In the appeal case of *Steel* v. *Cammell, Laird and Co., Ltd.* (1905, 2 K.B., 232), where the applicant, the workman, was suffering from lead poisoning, Lord Justice Mathew said: "The man was following a dangerous occupation, because it might involve the risk of lead poisoning. But the evidence shows that in the majority of cases the workman would not be affected, though there is a minority in which the injury is sure to arise, and when the lot fell on a particular individual it could not be said that the case was fortuitous or unforeseen." Injury by disease alone, not accompanied by an accident, was expressly excluded by Lord Macnaghten in *Fenton* v. *Thorley and Co., Ltd.* True, these were cases under the Act of 1897, but the words in the Act of 1906 were the same, and the Act of 1906 also contained provisions in section 8 for compensation for certain scheduled or trade diseases as if they were "injury by accident arising out of and in the course of the employment," indicating that such diseases were not considered to be accidents. What the applicant was suffering from was not one of the diseases mentioned in this schedule. For these reasons the appeal must be dismissed.—The Lords Justices agreed.

THE FIRST CASE OF PERJURY UNDER THE WORKMEN'S COMPENSATION ACT.—An important case, being the first prosecution for perjury under the Workmen's Compensation Act, came before the Court at Tottenham on Thursday last. The accused was a carpenter named Saunders, who, it is alleged, committed perjury in an arbitration case between himself and H. E. Brown, builder, of Edmonton, before Judge Tindal Atkinson. For the prosecution it was stated that Mr. Brown was asked to raise a platform in the Edmonton Town Hall for a charity concert. Saunders alleged that a section of the staging had fallen on him, injuring his arm and rendering him unfit for work for an indefinite period, and he claimed £1 per week under the Workmen's Compensation Act, 1906, from Mr. Brown, and subsequently brought an action which was tried by the Edmonton County Court Judge, who, after hearing the evidence of Saunders, dismissed the case without calling for the defence.—Mr. Brown, giving evidence, said no accident had occurred, and no complaint had been made by the defendant.—A foreman carpenter gave evidence to the effect that Saunders had a boil or carbuncle on his arm, and that he attempted to make up a case of accident on that account.—Saunders was committed to take his trial at the Central Criminal Court.

CARPENTERS' COMPANY AWARDS.

The Worshipful Company of Carpenters held an examination in Carpentry and Joinery on June 10th to 13th in London and Manchester. The following is a list of the successful candidates in order of merit:—

London: Silver medal, Wm. D. May; bronze medals, W. Wright and A. J. Parker; first-class certificates, E. E. Brockwell, E. L. Adams, A. J. Polden, D. Ostle, Alfred Gymer, T. R. Hampshire, J. E. S. Jackson, J. L. Thomas, H. J. Pullen; second-class certificates, E. H. Day and E. Bird (equal), D. Jenkins, B. S. L. Bartlett. G. Webster, A. Walpole, O. J. Sharp, H. E. Copelin, A. H. Trevenen, H. E. King, W. E. Black, W. L. Franklin, M. W. Gentle, G. A. Sinclair and E. T. Wall (equal), A. J. Pinnock, A. C. Carter, E. D. Kemp, W. Addicott, A. E. Carter and T. H. Knell (equal), and W. G. Quested.

Manchester: Silver medal, S. J. Spargo; bronze medal, J. R. Halsall; first-class certificate, T. Gorst; second-class certificates, W. G. Lewis, R. Garnett, Rd. Williams, C. H. Overend, Jas. Moss, J. Roebuck.

In response to the repeated applications received from various societies and instructors connected with the carpentry trade, the Carpenters' Company this year, for the first time, decided to hold a provincial examination, simultaneously and on precisely similar lines as that held in London, and they selected Manchester as the most suitable city. The number of entries for the examination this year, namely, 67, constitutes a record.

Awards at King's College.

The following is the list of prize-winners at the recent examinations at King's College, London, in the classes carried on under the joint auspices of the Carpenters' Company and the council of the College:—*Building Construction*: S. Evans, silver medal; G. J. Calder, bronze medal; H. R. H. Coney, £3 in books; F. Wilson, £2 in books. *Constructional Drawing*: Elementary, E. G. Sapstead, £1 in books; Advanced, G. J. Calder, silver medal; C. R. Carhrow, £3 in books; S. Evans, £2 in books. *Quantities*: H. C. Lowick, £3 in books; S. Evans, £2 in books; W. T. Matthew, £1 in books. Sir George Faudel-Phillips' bronze medal for sanitary building construction, J. F. Wilson.

TRAMS OVER KEW BRIDGE.—A committee of the House of Lords commenced last week the consideration of the London United Tramways Bill, which seeks power to construct a tramway over Kew Bridge, to connect the systems owned by the company on the north and south sides of the river. The Bill is opposed by the Middlesex and Surrey County Councils.

"ETERNIT" SLATES AND SHEETS.

The asbestos-cement slates, tiles and sheets which have been put on the market by Messrs. G. R. Speaker and Co., of 29, Mincing Lane, E.C., are being very extensively used, both at home and in the Colonies, and this is not surprising when we consider the many advantages they offer for roofing purposes, for wall linings, partitions, and numerous other purposes.

The slates are of the same thickness as British first-quality roofing slates, but a noteworthy difference is the surface of "Eternit," which is perfectly smooth—almost polished. Moreover, the slates are cut with very clean edges, and it is thus possible to form a thoroughly tight roof covering which absolutely keeps out damp, rain, or snow driving up between the laps.

Another point in connection with "Eternit" slates is that they can be laid diagonally, with the result that seven slates, measuring about 16ins. by 16ins., will cover an area of 1 sq. yd., giving each slate a lap of 2¾ins., whereas nearly 14 Welsh slates of the same size are needed to cover a similar area. A great saving in weight is thus effected, which, in itself, is a considerable advantage, as, of course the lighter a roof can be constructed the better. The average weight of Welsh slate roofing is about 67lbs. per sq. yd., and of red tile roofing 80lbs. per sq. yd., whereas "Eternit" roofs average only 21lbs. per sq. yd.

Extensive tests and experience in Great Britain and in the Colonies during the last six or eight years have proved that these asbestos slates do not crumble nor scale, nor are they affected by changes of temperature. They are also fire-proof and acid-proof, and are proof against the attacks of ants or other vermin. In this respect, therefore, they are particularly suitable for use in the Colonies, especially as they can be so easily shipped, with no risk of breakage in transit, the slates being composed of asbestos fibre, and, consequently, not being brittle. Their tensile strength is 5,781lbs. per sq. in., and the resistance to crushing 8,281lbs. per sq. in.

At this time of the year one becomes unpleasantly familiar with the fact that, under a hot sun, rooms in the roofs of houses are rendered extremely stuffy, and an endeavour is constantly made to overcome this drawback by white-washing the slates. With "Eternit" slates, however, nothing of the kind occurs, as they are very bad conductors of heat and cold, so that rooms are kept cool in summer and warm in winter.

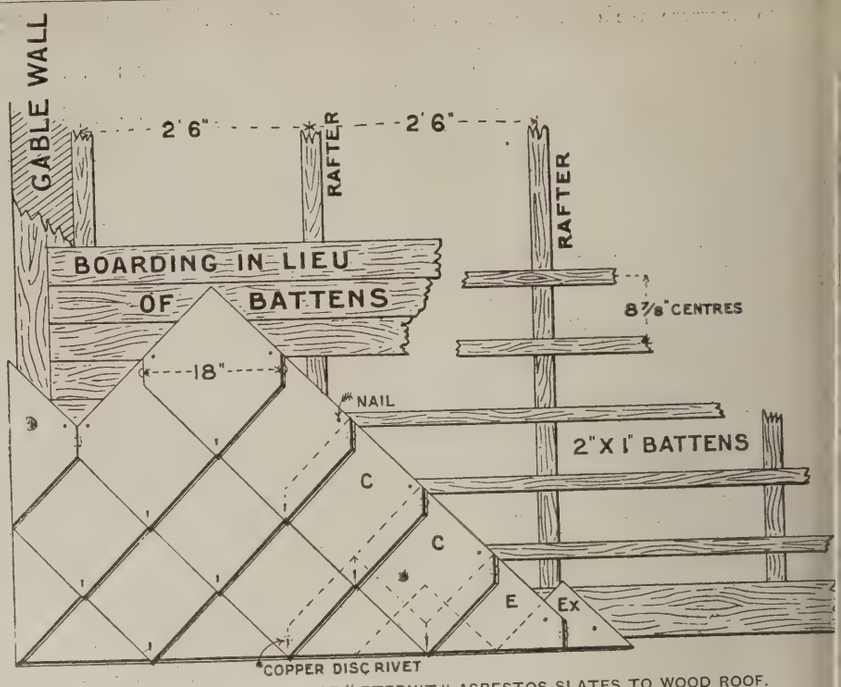

FIG. 1. SHOWING FIXING OF "ETERNIT" ASBESTOS SLATES TO WOOD ROOF.

With regard to fixing, there are several methods which can be adopted. Fig. 1 shows the method chiefly followed, and the illustration being self-explanatory, needs no detailed description. Fig. 2 shows how "Eternit" slates can be fixed to angle steel laths on iron roofs.

While the initial cost of "Eternit" roofs is less than that of any other durable roofing material, the ultimate saving to users is relatively great, inasmuch as "Eternit" roofs require no maintenance, but increase in strength with increase of age. Indeed, "Eternit" endures not for an age but for all time.

The material is also supplied in sheet form of various thicknesses for use fire-resisting lining to walls and ceiling the sheets range in size from 4ft. by 4 to 8ft. by 4ft., and cost from 2d. per ft. delivered to any part of Engla "Eternit" scale tiles, for turrets, e are also made, as well as ridges.

From the long list of buildings wh they have been used it is apparent t the merits of "Eternit" slates are w widely appreciated, for not only h they been extensively adopted by the miralty and the War Office, but they h also been used for innumerable facto and various classes of houses. As recent example, we would refer to new temporary law courts which h been erected at the Royal Courts of tice, which are roofed with "Eter slates, while another recent example be seen in the Embankment Gard where a small shelter is similarly roo

ELECTRICITY IN BUILDINGS. III.

By Harold Hastings, M.I.E.E., A.M.Inst.C.E.

(*Continued from page 18, No. 699.*)

A dynamo is a machine for producing rapid alterations in the magnetic fields enclosed by coils of insulated wire. It effects this by alternately presenting coils to opposite poles of magnets of great strength.

One of the earliest dynamos constructed was one in which powerful horseshoe permanent magnets revolved before a circle of coils. Later, the permanent magnets were replaced by electro-magnets excited by current from a battery of cells. Still later the magnets were excited by the current generated in the machine to which they belonged. Variations of this principle are still employed. The machines are so designed that they generate sufficient current to supply their own magnets with current, as well as the outside circuits which they supply.

The Essential Parts of a Dynamo.

are the field-magnets, the system of revolving coils—called the "armature"—and some form of collecting device for receiving the current from or conveying it to the revolving portion.

The accompanying diagram (Fig. 16) shows a simple type of dynamo. The direction of rotation is assumed to be clockwise. In their present position the poles A and B enclose the maximum amount of the magnetic field. During its passage to the position of B the field induced in coil A will produce a current in a certain direction, and during its passage to C the current will continue to flow in that direction.

The flow in the first quadrant is produced by the diminishing of the field due to a north pole, and during the next quadrant to the increasing field of a south. Referring to the results of experiment No. II. (BUILDERS' JOURNAL, July 1st, p. 18), it will be seen that these two sets of conditions produce the same result.

As the coil passes the position C, the field from the south pole changes from an increasing one to a diminishing one, and the direction of current will change. Again, the current produced by receding from the south pole is the same as that by approaching a north pole. It will now continue in the changed direction until it reaches its original position at A. Thus

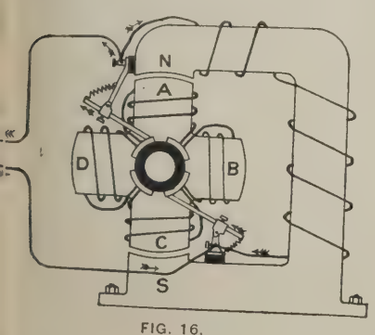

FIG. 16.

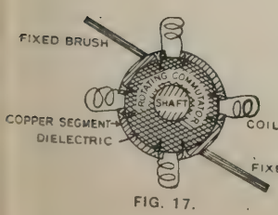

FIG. 17.

we have traced the revolution of one coil and found that every time it passes a pole the direction of the current is changed. The same sequence must be followed in the other coils. To make the current continuous in one direction it is necessary to introduce a device which will change the direction again every time that a coil passes in front of a pole. This is done by making a special form of collector. Four insulated segments are mounted round the shaft and revolve under two fixed contacts. If the contacts are placed opposite the two poles, the end of the coil from which the current is delivered to either contact will change as it passes the pole. A careful examination of the diagrams (Figs. 16 and 17) will make this clear. The revolving segmental part of this arrangement is called a "commutator" and the fixed contact pieces are the "brushes."

This is the entire principle of the continuous current dynamo. The number of pole-pieces of the field magnets may be increased, and there may be more coils in the armature and, consequently, more segments in the commutator, but throughout all such variations the principle remains unchanged.

The Alternating Current Machine.

is a similar apparatus without the commutator, and always having a small continuous current dynamo to energise its field magnets. The alternate coils are wound in opposite directions, and there

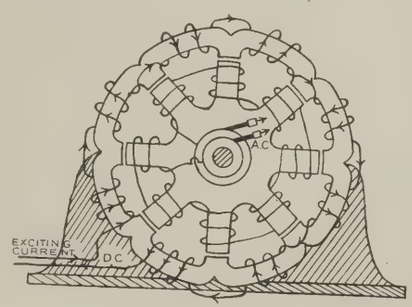

FIG. 18.

are always as many poles as armature coils. When two adjacent coils are approaching their respective poles the current induced by a south pole will be in the same direction as the current in the next coil, although that is approaching a north pole, because the coil is wound the reverse way. Similarly, all the coils are generating currents in the same direction at the same instant, but the next instant they have passed the poles and are generating a flow in the opposite direction. The current is collected by brushes resting on rotating rings, marked A C in the diagram (Fig. 18). The flow reverses many times per second. One flow in each direction is called a "period," having the symbol *v*. The number of periods per second is termed the "periodicity" of the system. The most common periodicity is 50, which indicates that 100 alternations in the direction of the current take place in one second. In between each alternation there is a point of no flow, or zero point. The eye cannot appreciate this when looking at a lamp, but it can be illustrated by swinging a stick in the light of an alternating arc lamp. There appear to be a series of sticks radiating from a common centre, like the spokes of a wheel, clearly demonstrating that there are instants during its travel in which there is no light with which to see it.

"Dynamos" and "Motors."

We found from experiment No. I. that a flow of electricity through a wire produced a magnetic field, and in experiment No. III. that the converse held—viz., that a magnetic field produced a current. This principle holds throughout. If we supply energy to revolve a dynamo we obtain electricity, and if we supply electricity to a dynamo it revolves, giving us mechanical energy. When the apparatus, hitherto termed a dynamo, is revolved in his manner, it is called a "motor." The difference is solely one of name. The action in the case of a motor is the mutual attraction of two electro-magnets. The coil A in the accompanying diagram (Fig. 19) has the current flowing through it in such a direction that its extremity remote from the centre is a south pole. It is, therefore, attracted by the north pole of the field magnets and repelled by the south pole. As soon as it passes the north pole the current in the coil is reversed by the commutator, so that it is now repelled by the north pole and attracted by the south. The force of repulsion was shown to be equal to the force of attraction in experiment No. II. Every coil re-acts in the same manner, and the result is mechanical power derived from electric power.

Enough has now been said to give the reader a good foundation to build up a more intimate acquaintance with the properties of electricity. We will, therefore,

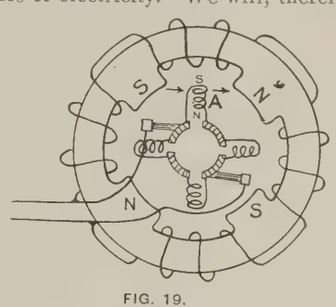

FIG. 19.

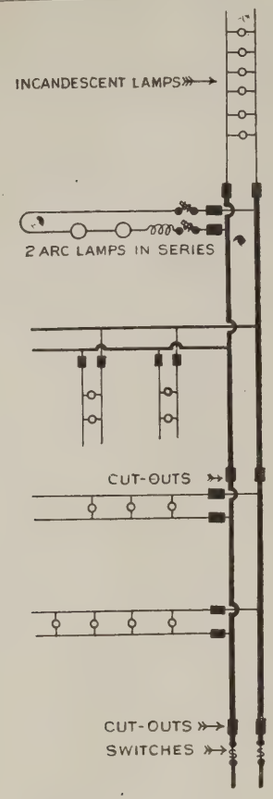


proceed from the generation of the electric current to investigate the particular uses in buildings.

Installation Work and Materials.

When designing an installation there are two systems to choose between. They are the "Tree-system" and the "Distribution-board system." The former was a universal method until supplanted by the latter some fifteen years ago. It is still used in isolated cases, but the majority of work is now carried out upon the more adaptable distribution-board method.

In the tree-system (Fig. 20) the mains are carried from bottom to top of a house, with reductions at each floor in the sectional area of the conductor. Sub-mains are tapped off these to convey the current to the circuits, to which the lamps and other apparatus are connected. Each reduction and each sub-main has to be protected by a safety cut-out, a device which will be considered in detail later.

In the distribution-board system (Fig. 21) the mains enter the house, and, at some convenient point, are connected to a board from which radiates a group of circuits. In small houses one such board forms the centre of the whole installation, while in large buildings there is a board for each floor. The safety cut-outs for all the circuits can thus be grouped together on the board, and, as they require to be examined when there is anything wrong with the light, it is much better to have

TREE SYSTEM.
FIG. 20.

them all in one well-chosen spot than to have to wander from place to place examining individual cut-outs scattered broadcast about the house. Another consideration of some importance in favour of the distribution-board system is that the sizes of wires used in the installation are not so numerous.

The diagrams show the points of difference in the two systems.

After the system for the particular building under consideration has been settled, the number of lamps and other apparatus should be scheduled. It is customary to reduce all lamps, etc., to their equivalent in 8 candle-power incandescents. The positions of the distribution-boards or cut-outs are fixed, and the routes of the wires decided.

The loss which may be allowed in transmission will have a great deal to do with the expense of the installation, and should be settled at this stage. It is false economy to allow a loss above 2 per cent. in the wires, as this is always increased to 3 per cent. when the loss in switch and fuse contacts is taken into account.

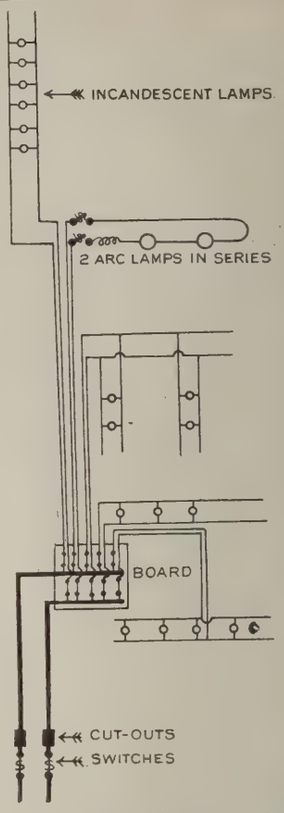
Having arranged all these details, the materials can be estimated and obtained.

Before we can discuss one or two typical installations it is necessary to explain the different articles required, and the points in design which serve as a guide to the buyer. We will, therefore, take each item in a list of materials and consider it exhaustively, so that the reader may understand all the functions of the apparatus before we apply it to particular cases.

It must be understood that we are dealing with electric-lighting installations only at present, in which we include wiring for electric fans, heaters, cookers, and even small motors, but not telephones, nor bells.

Cables and Wires.

It has already been shown that a conductor of electricity must be completely surrounded by a dielectric in order to convey the current to the point at which it is to be used. It also must have a path back to the source of supply provided for it. The conductor which is universally used for this purpose is very pure copper. High-conductivity copper is classified by comparing it with what is known as "Matthiessen's standard." It does not concern us how that standard was fixed, but it is important to know that there is such a standard when buying, and to obtain a certificate giving the conductivity. Nothing less than 98 per cent. should be used, and for good work 99 per cent. is the proper class to put in. If the conductivity is low the wire will be hard and brittle, requiring greater care in handling and jointing.



All wires must be well tinned, as the dielectrics most commonly employed contain substances which re-act chemically upon copper, but not upon tin. A badly tinned wire is easily detected by stripping back the insulation and looking for a black deposit upon the wire. Such a deposit indicates that the coating is inefficient. Tinning is also of value in facilitating the soldering of joints.

As a thick wire will not stand so much bending about as a thinner one, it is advisable to employ a stranded conductor, rather than a solid wire. In no case should a wire of greater size than No. 16 S.W.G. be used. Wires sometimes break inside the sheath of insulating material without being detected until current is switched on. Owing also to trouble with wires breaking, it is unwise to allow any *single* insulated wire of less size than No. 18 to be used.

A glance at the wiring table will show that it is quite easy to avoid using single wires altogether. A strand of three wires of No. 22 will always supplant a single No. 18, and a strand of three No. 20's can be used for No. 16.

Small conductors obviously have a much larger radiating surface than those of greater sectional area, and can therefore convey a current of superior density per square inch. This has already been referred to, and 1,000 ampères per square inch was given as an approximate rule.

The Institution of Electrical Engineers has issued a table showing the amount of

DISTRIBUTION BOARD SYSTEM.
FIG. 21.

current which may be passed saf through a conductor without incurri danger from overheating.

The accompanying table has b drawn up to show this and other useful formation regarding conductors.

It will be noticed that conductors always stranded up in 3's, 7's, 19's, 37's. This is done in order to comp the circle of wires in each case.

Insulation.

The dielectric most commonly used covering wires for house-wiring is c posed partly of pure and partly of vulcanised india-rubber. These are gener applied in three layers. The pure rub

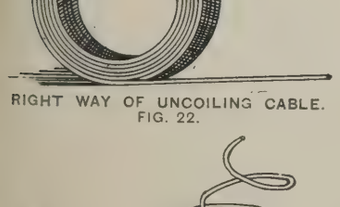
Specification, 600 megohm, Association class, H.C. wires tinned, insulated with pure and vulcanizin rubber, taped, braided and compounded.

is placed next to the conductor, the two classes of vulcanising rubber are next applied. These differ from one another only in the quantity of loading which they contain. The cable is put in a vulcanising receiver and thoroughly vulcanised. After this operation the three layers should closely adhere.

The dielectric is mechanically protected by tapes and braid, saturated with a preservative compound. To ensure obtaining permanently satisfactory cables it is only safe to buy those which are manufactured under the guarantee of the Cable Makers' Association. There is scarcely any manufacture which lends itself so readily to deception as that of rubber cables. It is to be regretted that the English market has been flooded with cheap insulated wires of foreign make which apparently satisfy the usual tests, but which are cheapened by the use of adulterants of unstable character. Such wires rapidly deteriorate and should be avoided.



In order to compete with low-grade foreign cables, the Cable Makers' Association have found it necessary to classify two kinds of cables, which they call "Association" and "Non-association." The former are made in accordance with the British standards and should always be employed where the best work is desired. The latter may be used upon temporary work only.

Test for Quality of Rubber.

An easy test for the quality of rubber on cables is to cut off a length of 15in. and to carefully remove the wires, braids, and tapes so as to leave a tube of the dielectric alone. The tube thus obtained should be gripped between clamps at each end and stretched to double its original length. After it has been held in this extended position for 24 hours, it should be released and allowed to regain its former length as far as possible. If it is of good quality, it will only have an elongation of 15 per cent. more than its original length at the end of another 24 hours' rest. There should be no sign of any cracking or splitting, nor should the layers show any signs of separating from one another.

When this test is completed weigh the rubber tube carefully, then burn it and weigh the ashes. They should not exceed 40 per cent. of the original weight.

There is a right and wrong way of uncoiling wires and cables (see Figs. 22 and 23). The wrong way is to take hold of one end of the coil and to pull the wire off in a spiral. Each of the original turns of the coil becomes a twist when the wire is straightened out, and all these twists tend to displace the layers of tapes, braids, and dielectric.

RIGHT WAY OF UNCOILING CABLE.
FIG. 22.

WRONG WAY.
FIG. 23.

The right way is to turn the coil up on its side and roll it along the ground, leaving the wire behind in a straight line. This is one of the little points so often overlooked by workmen, and it makes all the difference when the final tests are taken.

Flexible Cords.

Flexible cords are stranded cables made up of a large number of very fine untinned wires. The usual size for wiring lamps is 35/40 S.W.G., and this is equivalent to 1/20. For heavier currents a size of 70/40 is used, equivalent to 1/18.

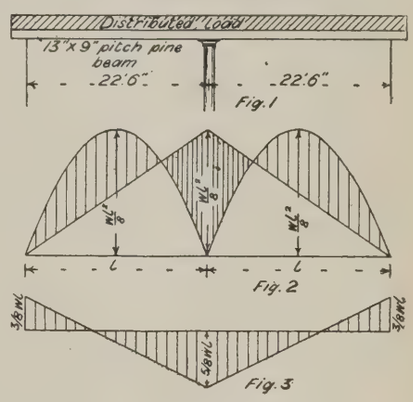
The use of a fine strand gives the conductor great flexibility, so that it can literally be tied in knots without any danger of breaking the wires. The strands are insulated with pure and vulcanised rubber and covered with braiding of cotton or silk. They are twisted together in pairs, and can be obtained in a multiplicity of colours to suit any scheme of decoration. As the two opposite poles are brought in such proximity, it is important to be sure that the cords are of good quality. Three classes are made—viz., cotton, silk, and workshop. The two former are for use inside houses, and the last is covered with a very heavy braiding, which is impregnated with damp-resisting compound.

(To be continued.)

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Casting a Sundial in Lead.



LONDON, S.W.—G.S.H. writes: "I have made a plaster model of a horizontal sundial, with raised lines and figures, of which I wish to cast a copy in lead. Will you kindly tell me of what material the mould should be made, and whether the lead should be poured over the surface of the mould in a horizontal position? I have tried a plaster mould, but failed, owing to bubbles in the lead."

The Bromsgrove Guild of Applied Arts have been good enough to inform us that the probable cause of bubbles appearing on the casting when executed from the plaster mould is the absence of vent holes to allow the air to escape. They add that this method of casting in plaster moulds, for lead, is never satisfactory—the work should be cast in a sand mould.

Strength of Beam Supported in Centre.

CHORLEY.—J. H. writes: "What would be a safe load, equally distributed, upon a pitch-pine beam 13 ins. deep by 9 ins. wide, 45 ft. between walls, and supported in the middle with large cast-iron pillars? What would be a safe load on the same beam if we bolted a 13 in. by 3 in. flitch on each side?"

The beam, being supported in the centre, becomes what is technically known as "a continuous beam" over two equal spans, and the stresses under a given loading will vary with the comparative level of the supports. In order that the theoretical conditions may be realised, it is necessary that the three supports should be rigid and remain permanently at the same level. In that case the equally-distributed load will not affect the supports quite as one would expect. Instead of the division being $\frac{1}{4}$, $\frac{1}{2}$, $\frac{1}{4}$, it will be $\frac{3}{16}$, $\frac{5}{8}$, $\frac{3}{16}$, so that the centre column will have to carry 25 per cent. more than might be expected. The distribution can be brought to $\frac{1}{4}$, $\frac{1}{2}$, $\frac{1}{4}$ by slightly lowering the centre support, but the stresses in the beam are then increased, and it is practically inadmissible. The conditions of the beam being as Fig. 1, the bending moment diagram with level supports will be as shown in Fig. 2, and the shear diagram as Fig. 3. The

maximum stress will occur over the central support, where the bending moment $= \frac{wl^2}{8}$, the moment of resistance $= ZC = \frac{bd^2}{6} \times 14{,}000 = \frac{9 \times 13^2}{6} \times 14{,}000 =$ 3,549,000 lb.-ins. Then $\frac{wl^2}{8} = 3{,}549{,}000$, but $l = 22.5 \times 12 = 270$ ins., therefore $w = \frac{3{,}549{,}000 \times 8}{270 \times 270} = 390$ lbs. per foot run breaking weight. Allow a factor of safety of 7, then the total safe load on the beam will be $\frac{300 \times 45}{112 \times 7} = 22.4$ cwt. If the breadth be increased by bolting a 13 in. by 3 in. pitch-pine flitch on each side of the present beam, the strength will be increased in the proportion of 9 to 9 + 2 × 3, or 0 to 15, and the safe load will then be $22.4 \times \frac{15}{9} = 37\frac{1}{3}$ cwt.

HENRY ADAMS.

Staining Cement Stucco Green.

CO. TIPPERARY. — W.H.C. writes: "Please let me know how to bring cement stucco to a green colour (without use of paint) for external work."

It is assumed that the correspondent desires to know how to stain cement, before it is applied as a stucco, so that it may be of a green colour. Stained cement, especially when applied to large superficial areas, is apt, after a time, to look patchy and faded owing to the action of the contained lime. For a green tint, the following recipe has been recommended in a trade publication:—Add to 85 parts of cement 12 parts of oxide of chromium and 3 of iron or copper. A great point is to mix the stain and cement intimately in their proper proportions before use. Mr. H. Cohen, of King William Chambers, 27 and 28, King William Street, London, E.C., is agent for a firm of German manufacturers of stains, who say they guarantee them to be proof against alkalies, and that the quantity required is so small that the strength of the cement is very little diminished.

THOMAS POTTER.

Veneer Polish.

LONDON, W.—S.H.M. writes: "Three or four years ago, a traveller introduced to me a sample of a transparent preparation that might be applied to the surface of mahogany or other wood, after polishing, and when dry presented a hard (though not brittle), transparent, and highly polished surface, similar to that of the counters enclosed. If you know of such a wash, I should feel obliged if you would kindly quote the firm from whom it is obtainable."

The counter enclosed by the correspondent appears to be of polished bone. A material called "Liquid Veneer," which is an excellent article for polishing and keeping in good order mahogany and other polished surfaces may possibly meet the correspondent's requirements. The London agents are Messrs. Reinemann and Co., 7, New Zealand Avenue, London, E.C.

A. S. J.

Fixing Modillions at Gable End.

LONDON S.E. — ENQUIRER writes: "Which is the right way to fix modillions that form part of an eaves cornice—square off the rafter, or on the cant?"

It may depend somewhat upon the class of work, but usually the modillions or dentils are placed vertically under a sloping gable end or pediment. In Swiss cottage work the projections under the gable ends are square to the slope to show as ends of purlins. HENRY ADAMS.

Prices per Foot Cube.

LONDON, N.—CUBE writes: "What is a fair price per foot cube for cheap contract work, where several houses are built at one time to the same plans? Is it usual to make any difference in price for basements and back additions?"

The usually accepted prices for the buildings are as follows:—Labourers' cottages, 4½d. to 5½ per ft. cube; small houses, 6d. to 9d. per ft. cube; large town houses, 8d. to 1s. per ft. cube; the prices of course varying according to the quality and finish of the work. Basements and back additions are usually cubed out with the main blocks. It should be remembered that "cubing out" is only a rough and "rule-of-thumb" method of approximately ascertaining the cost of a building. F.S.I.

Reinforced Concrete Raft Foundation.

X writes: "The accompanying plans (not reproduced) show two new classrooms built about a year ago. Serious cracks have developed. The building is erected on a sloping site on clay, and the precaution was taken to have a good spread of concrete in footings, and two good buttresses built at the north end. On looking at the ground it appears that the bed of clay has moved towards the north. I have since been told that the clay in the district has a tendency to shift; so the use of more buttresses would not help. I think of underpinning the footings half-way and putting in reinforced concrete, thus standing the building on a frame. Do you think this will be satisfactory?"

A clay foundation is always unreliable, especially when the site is sloping. The ordinary form of foundation is not suitable for such conditions, as the clay shrinks and the building becomes supported only at points. Either frame construction or independent foundations should be employed. If the loads can be concentrated at points, the foundation should be so proportioned that the same nett pressure on the soil is given throughout; the whole of the foundations will then sink equally: the walls should be self-supporting. A frame construction can be designed so that the entire building will hang together, but if this is adopted it might sink down at one end, and such a tendency means that the raft must be strong, which consequently makes it not so economical a solution as the former method. Several specialist firms have had experience in this direction and might be consulted, or you could put the matter in the hands of a consulting engineer.

Steel and Concrete Bridge.

ASHBURTON. — F.J.B. writes: "It is proposed to build, on a main road, a bridge of 9ft. span by 20ft. wide, with 9ins. by 7ins. steel joists spaced 2ft. 3ins centres, with 3ins. by 3ins. steel joists at 2ft. centres, resting in bottom flanges of same; the whole encased in concrete 15ins. thick, projecting 3ins. below joists to form floor. Is this good construction?"

The cross girders, having so great a depth of concrete above them may be calculated by the writer's reinforced concrete beam formula. W = safe load at one month in cwts. distributed including weight of beam, b = breadth of concrete in inches, d = depth of concrete in inches to centre of reinforcement, p = percentage of reinforcement, L = clear span in feet, ends supported. Formula, $W = (\cdot37p + \cdot214)\frac{bd^2}{L}$. The span L will be the centre distance of main girders = 2ft. 3in. The breadth (b) will be the distance centre to centre of the cross girders = 2ft. The depth (d) will be 15in. total—3in. concrete underneath—1½in. half depth joist = 10½in. The percentage of reinforcement will be $100 \times \frac{area\ joist}{bd} = \frac{100 \times 2\cdot5}{24 \times 10\cdot5}$ = say 1 per cent. Then $W = (\cdot37 \times 1 + \cdot214)\frac{24 \times 10\cdot5^2}{2\cdot25} = 686\cdot6$ cwts. The weight of structure and road metal for this width will be about 9 cwt., leaving 686.6—9 = 678 cwt. safe load on an area of 2ft. by 2ft. 3in., or $\frac{678}{2 \times 2\cdot25} =$ 150 cwt. per foot super., so that there is a great excess of strength at this part. The main girders bear so large a proportion to the concrete embedding them that they should be taken as in their ordinary condition. A 9in. by 7in. by 58lb. rolled steel joist, with a span of 9ft. will carry 28 tons distributed. The weight of structure and road metal taken by each main girder, $\frac{9ft.\ span}{2ft.\ centres} \times 9$ cwt. on each iron girder = 40 cwt. = 2 tons, and 28—2 = 26 tons for external load. As they each serve an area of 9ft. × 2ft. 3ins. = 20¼ sq. ft., the safe external load will be $\frac{26 \times 20\ cwts.\ in\ 1\ ton}{20\frac{1}{4}}$ = say, 26cwt. per foot super., which is more than can be put upon it by the heaviest traction engine or road roller. The main girders might be placed 4ft. centres, and the cross girders 3ft. centres, and the concrete reduced to 13in. deep.

HENRY ADAMS.

Cottage Building.

BIRKDALE.—RUBEO writes: "(1) What books (cheap) will enable me to write a specification of a cottage or house? (2) How it is possible for a young man without capital to erect a house—that is, would it be easy to obtain a loan for th purpose, mortgaging the house?"

(1) "Specification," price 3s. 6d. net (Technical Journals, Ltd., Caxton Hous Westminster) will serve your purpose com pletely. (2) It will be by no means easy t obtain the capital unless our correspond ent happens to have a wealthy and trus ful friend who is willing to risk money i a decidedly dubious adventure. A build ing society might possibly be induced advance on mortgage a certain propo tion of the money, if the security seeme good enough, but would not be likely finance an inexperienced beginner, w would probably soon become hopeless embarrassed.

A Bridge Over a Stream.

C.H.H. writes: "Which would be th least costly method of erecting an ir bridge 18ft. 6ins. long, to carry a roadw of the clear width of 15ft. across a strea Would reinforced concrete be best?"

In this particular case we should thi an ordinary iron bridge would be a mo economical form of construction, and advise our correspondent to apply f estimates to several of the firms that ma a special feature of such work. So particulars of a small steel bridge over stream will be found on p. 288 of o issue for December 5th, 1906.

Rights of Adjoining Owners.

HULL.—W.B.B. writes:—"I have fo teen houses in a certain street. Adjo ing my property there is an iron found to which all the tenants object beca there is a continual knocking—sometim going on until late in the night, and ways starting at six o'clock in the mo ing,—and because when the wind sets a certain direction, a nasty sulphur smell is borne towards the houses, wh therefore let badly. Can I enforce foundry people to buy the property?"

The fact that one landowner choo to build cottages and another owner p fers an iron foundry has nothing wh ever to do with this case—each has eq rights in this respect. You can o legally complain with regard to the no and smell if the foundry is improp conducted and without due care, therefore in such a way as to cause necessary noise and smell—a most d cult thing to prove. You cannot com the foundry people to purchase your p perty; the legal remedy (if any) would by injunction and damages; but I i you will not find "the game's worth candle." F.S.

Mechanics of Building Construction

HUDDERSFIELD.—E.W.T. writes: the reply entitled 'Formulæ for Bea in your issue of June 3 (p. 481), Pro sor Henry Adams refers to his lecture teachers at the Royal College of Scie Are these the same as 'Strains in Ir work?' If not, where can the lecture question be obtained?"

The lectures to teachers referred to not yet published. They will be announced when ready. They are m more advanced and comprehensive t "Strains in Ironwork."

HENRY ADAM

STREET FIRE-ALARMS.—At Kings on Wednesday last, a boy was summo for breaking the glass of one of the alarms in the borough, though, fo nately, the brigade were not called A fine of 5s. was imposed.

"ARCHITECTURE & JOURNALISM,"

This is the title of a booklet, beautifully printed and illustrated, giving an interesting account of the publications issued by this Company. This booklet contains a suggestion, and sets out an arrangement showing how Architects and others can utilise any particular points of interest that they come across in their practice, and thus not only add to their own incomes, but add to the value and practical interest of our papers.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 30. HIGHTOWN (Dewsbury).—Erection of three houses at Hightown. Plans and specification can be seen at the offices of E. Vincent King, A.R.I.B.A., architect, 24, Westgate, Dewsbury, to whom tenders must be sent by July 30.

July 30. ROTHERHAM.—Alterations and extensions at the Rotherham Grammar School. Persons desirous of competing should forward their names and addresses to Spurley Hey, clerk of the Governors, Education Offices, Town Hall, Rotherham, by noon on July 30, together with £1 1s. deposit.

July 30. LONDON, S.E.—Taking down and rebuilding fire-brick lining to flues and renewing other brickwork of three boilers at the Ladywell Workhouse, Ladywell Road, Lewisham, S.E., according to the specification of A. H. Newman, F.R.I.B.A. Sealed tenders and other documents above referred to, endorsed "Tender for Brickwork to Boilers, Ladywell Workhouse," must be delivered to E. Pitts Fenton, clerk to the Guardians, 283, Tooley Street, London, S.E., by 6.30 p.m. on July 30. Fair wages clause.

July 30. RAMSGATE.—Reconstruction of the Council Chamber, Albion House, for the Corporation. Plans and specifications can be seen and full particulars obtained on application at the borough engineer's office, Albion House, between 10 a.m. and 4 p.m. (Saturdays excepted). Tenders endorsed "Council Chamber,' and addressed to the "Chairman of the Works Committee, are to be delivered at the office of T. G. Taylor, borough engineer, Borough Engineer and Surveyor's Office, Albion House, Ramsgate on or before noon July 30.

July 31. LLANTWIT-FARDRE.—Erection of 21 houses at Church Village, Llantwit-Fardre, in accordance with plans and specifications prepared by Ll. Thomas, A.M.I.M.E., architect and surveyor, Church Street, Pontypridd. Sealed and endorsed tenders to be sent to J. R. Thomas, auctioneer, Market Chambers, Pontrypridd, on or before July 31.

July 31. BRISTOL.—Additions to factory, Rowley Place, Temple Gate, Bristol, for Messrs. Todd and Co. Plans and specifications can be seen and quantities obtained at the offices of Henry Williams, architect, Alliance Chambers, Corn Street, Bristol, to whom tenders must be sent on or before July 31.

July 31. SETTLE.—Mason's (labour only), joiner's, plumber's, plasterer's and slater's work for proposed detached house at Settle. Plans may be seen with, and quantities obtained, from James Hartley, architect, Skipton. Sealed tenders must be sent to Mr. W. Sunderland, Thornfield Villa, Hellifield, on or before July 31.

July 31. HULL.—Construction of a bridge to carry Leads-road (leading from Stoneferry to Sutton) over Foredyke Stream, in substitution for the existing bridge, known as Leads Bridge. The abutments and arch will be in concrete, and the wing walls and parapet in brickwork. Forms of tender and other particulars may be obtained at the City Engineer's Office. Tenders endorsed "Tenders for Leads Bridge," are to be addressed to the Chairman of the Works Committee, and delivered at the Town Clerk's Office before noon on July 31.

August 1. SCORRIER, Cornwall.—Rebuilding of Scorrier House for Mr. J. Williams. Drawings and specifications may be seen at the office of B. C. Andrew M.S.A., architect, Biddicks Court, St. Austell, by whom sealed tenders will be received not later than August 1.

August 1. ORMESBY. — Alterations and additions to the Council Room and Offices in High Street, North Ormesby, for the U.D.C. Persons desirous of contracting for the work may see the plans and specifications, and conditions of contract on application to W. G. Harrison, surveyor, Council Offices, High Street, North Ormesby. Sealed tenders, endorsed "Council Office alterations," must be sent to A. H. Sill, clerk to the Council, 15, Albert Road, Middlesbrough on or before August 1.

August 3. CWM.—Erection of a goods shed at Cwm, Monmouthshire, for the G.W.R. Plans and specification may be seen, and forms of tender and bills of quantities obtained at the office of the engineer at Newport Station, between 10 a.m. and 4 p.m. Tenders, marked outside "Tender for Goods Shed, Cwm:" will be received by G. K. Mills, secretary, Paddington Station, London, on or before August 3.

August 3. DARLINGTON.—Forming playground, erection of conveniences, and alterations to cloak rooms, etc., at Beaumont Street Schools. Plans and specifications may be seen, and bill of quantities and form of tender obtained at the offices of Mr. George Winter, Borough Surveyor and Waterworks Engineer, Town Hall, Darlington, on depositing a cheque for £2 2s. Tenders, endorsed "Alterations to Schools," must be sent to Henry G. Steavenson, Town Clerk, Darlington, by noon on August 3.

August 3. LONDON, W.—Erection of six coal offices at Acton Station, and six at West Ealing Station, for the Directors of the Great Western Railway. Plans and specifications may be seen, and forms of tender and bills of quantities obtained, at the office of the engineer at Paddington Station, between the hours of 10 a.m. and 4 p.m. Tenders addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Coal Offices," will be received on or before August 3.

August 3. KEYNSHAM (Bristol).—Extension of the station buildings, verandahs, etc., at Keynsham Station, near Bristol, for the G.W.R. Co. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the engineer at Bristol Station, between 10 a.m and 4 p.m. Tenders, marked outside "Tender for Station Buildings at Keynsham," to be sent to G. K. Mills, secretary, Paddington Station, London, on or before August 3.

August 4. FERRYHILL.—Alterations and improvements to the hall property at Ferryhill Village, for the Parish Council. Sealed tenders must reach R. Willey, clerk to Council, Ferryhill Village, by noon on August 4.

August 5. COLWYN BAY.—Erection of the first portion of St. Paul's Mission Church. Plans may be seen and bills of quantities, forms of tender, etc., obtained on application to the architects, Messrs. J. M. Porter and Elcock, the Estate Office, Colwyn Bay, upon payment of a deposit of £1 1s. Tenders to be in on or before August 5.

August 5. LONDON, E.C.—Supply and delivery of Portland cement, for the East Indian Railway Co., as per specification to be seen at the company's offices. Tenders are to be sent to C. W. Young, secretary, Nicholas Lane, London, E.C., marked "Tender for Cement," not later than 12 o'clock noon on August 5. For each specification a fee of £1 1s. is charged, which cannot under any circumstances be returned.

August 5. SALFORD.—Erection of a new wall and entrance gates at the Bloom Street Gasworks Extension, Chapel Street, Salford. The drawings may be seen, copies of the specification, bill of quantities, and form of tender obtained (for which a charge of 21s. will be made), on application to Mr. W. Woodward, engineer, Gas Offices, Bloom Street, Salford. Sealed tenders, endorsed "Tender for New Wall, etc.," to be delivered to L. C. Evans, town clerk, Salford, not later than 3 p.m. on August 5.

The "Stud" Tramway System.

Some additional facts have been made public in regard to the "G.B." (Griffiths-Bedell) surface contact system, as laid down on the Aldgate-Bow route, which put the matter in quite a different light. It appears that the County Council officials have seen fit to depart from the patentees' system in several important particulars, and the result has been disastrous. The "G.B." Company have thus suffered a great injustice, because the safety of their system has been stigmatised, whereas, when properly installed as at Lincoln (where, since its introduction in November, 1905, it has been a complete success), it is perfectly safe. At Lincoln there has not been a single instance of shock caused by "live" studs, and the "G.B." company affirm that there are no conditions prevailing in the Bow Road that militate against the safe working of their system, if carried out in accordance with their patents; in support of which assertion they offer to put the electrical equipment of the track in an efficient state, and to maintain it in that state for twelve months, provided the Council will equip the cars in accordance with their designs. Without question, the company have been most unfairly dealt with, and a grave reflection has been unwarrantably thrown on the safety of their system; and this is particularly to be regretted, because the system is cheaper (or, in any case, is no more costly) than the overhead system, while it possesses the merit of the conduit system in not being unsightly.

The Latest Competition Evil.

In these days, competitions appear to be as fruitful a source of trouble as any other of the world's imperfect institutions. From time to time we have chronicled more or less vehement outbursts and controversies concerning some phase of competition strife which had provoked its victims beyond the limit of silent endurance. The assessor was usually the evil genius of the piece; sometimes he adhered too strictly and literally to the conditions; sometimes he did not adhere to them at all: sometimes he was too stringent over cost; and yet another time he was oblivious to the question of cost; but, in any case, he was absolutely and entirely wrong; and the disappointed competitors clamoured loudly for his removal and the institution of a fresh trial. We were becoming inured to this class of competition aftermath when a new trouble developed on more or less original lines. This time it was the single assessor who was at fault. One man could not be safely trusted. He would not feel strong enough to fight unreasoning prejudice, to preserve an unbiassed opinion. He would be open to the subtle flattery of any competitor who played—or preyed—upon the assessor's work. There should be in all important competitions at least three or more assessors; so the reformers decreed; and the County Hall competition gave them a good opportunity of testing the theory. The result, as we all know, has left them even less satisfied than they were before; and still more forcibly persuaded of the general incompetence of assessors as a body. Then there were other troubles—unfair conditions—conditions requiring more accommodation and facilities than could possibly be provided with the sum available. There was the public body that would overthrow the assessor's work, and award the premium to some local aspirant or other competitor who, for the moment, had caught the members' fickle fancy. Such points of disagreement might be multiplied by a score of others, which do not need to be enlarged upon. Hardly a single phase or stage of competition work has failed to furnish an opportunity for dispute. Now, however fanciful some of the grievances have been in the past, due in many instances, to chagrin rather than to injustice, there is no gainsaying the fact that the latest trouble is a very real and annoying one. It has become a custom for the promoters of competitions to protect themselves against the machinations of the idle and curious, who had no real intention of competing, by exacting a deposit fee of a guinea and upwards for the particulars and conditions of the competition; and this sum was always refunded either on the return of the conditions or on the receipt by the promoters of a genuine design. But some of the modern bodies have gone one better. They refuse now to return the deposit unless they receive a genuine design, so that an architect is unable to withdraw from the competition if he thinks the conditions are unsuitable without losing his deposit fee. He is to be mulcted for merely learning the conditions under which he is expected to work. This is the latest and grossest phase of competition work, and there is only one word to express it. The people who practise this deposit snatching are just thieves, and as much entitled to the delicate attention of the Public Prosecutor as any other form of swindler.

The Shakespeare Memorial.

At a meeting held at the Mansion House on July 21st to discuss the question of the Shakespeare Memorial, the following resolutions were unanimously adopted:—"(1) That the Shakespeare Memorial Committee consist of the members of the present Shakespeare Memorial Committee and the members of the present National Theatre Shakespeare Memorial Committee. (2) That an executive committee be elected, consisting of 21 members, with the addition of an honorary secretary and a secretary, and with power to add to their number." The proceedings terminated after the election of the executive committee referred to in the second resolution, and thus, at any rate for the present, a truce has been arranged between the rival committees appointed to do honour to the memory of our great national poet. We are inclined to think that the policy of thus uniting the two committees, and issuing a joint appeal, with the view of obtaining the necessary funds for the erection of a National Theatre, is a wise one, because, to begin with, no one could look forward with any degree of confidence to the probability of attaining a satisfactory artistic result through the medium of a competition (limited to "English-speaking peoples") for the grandiose monument it was originally proposed to erect in Portland Place. But, on the other hand, we are not convinced that the proposal which is shortly to be brought under the notice of the public is likely to prove an ideal one. We presume that the National Theatre, if ever it be realised, will comprise a huge stone structure fashioned in the popular architectural style of the day, and therefore far more likely to be distinguished for its bizarre ornamentation and "picturesque" unrest than for any vast amount of monumental dignity. No doubt, a large stage, admirably designed and equipped for spectacular displays, will form a salient feature of the scheme, and thus will offer facilities to any popular actor-manager who may have control for the introduction of unduly elaborated scenic effects, and for the presentation of gorgeous interludes and pageants which, however pleasing in themselves, are altogether opposed to the

spirit and stagecraft of Shakespeare's dramatic writings. Given the facilities afforded by the luxurious equipment of a modern stage for a spectacular display altogether opposed to the conditions under which the author's work was first presented, it seems to us that much of the very essence of Shakespeare's plays will be lost in a blaze of artistic splendour produced by interpolated scenic effects. For this reason we frankly confess we are unable to feel any very great amount of enthusiasm for the proposals of the National Memorial Theatre Committee, assuming, of course, which we believe will prove to be the case, that the primary idea is the institution of a thoroughly well-equipped and up-to-date theatre in which Shakespearean revivals will be given with the splendid mountings to which we have now become accustomed. Instead of a palatial structure erected in a portion of London with which our poet had no immediate connection, we should infinitely prefer to see (on the south side of the river, in the locality associated for all time with his everyday life and work) a playhouse of modest architectural pretensions of which at least the stage portion would be an exact reproduction of one that was deemed sufficient for its purpose in the golden days of Queen Elizabeth. Adjoining the theatre, but placed at the opposite end of a "Shakespeare" garden, planted wholly with the flowers and plants mentioned in Shakespeare's works, and further embellished with a statue of the poet of modest pretensions, there might be a library and museum of sufficient capacity to house a large collection of Shakespearean books and relics.

SOUTHEND PIER has been improved by the addition of a promenade deck with bandstand, erected 13ft. above the existing pier extension. The band enclosure measures 120ft. by 36ft., and has seating accommodation for 600. The work has been carried out by Messrs. Wall and Co., contractors, of Grays, from the designs of the borough engineer, Mr. E. J. Elford, at a cost of £6,000.

DRAWN BY LESLIE WILKINSON, A.R.I.B.A.

This elegant fountain is one of the finest in Viterbo. It is executed in a dark brown sandstone and is surmounted by lions and a palm-tree—the cognisance of Viterbo. The design is attributed toVignola.

THE ALLIANCE BETWEEN GOVERNMENT AND ART

Three times in the history of the world has an experiment been made by which the centralising and governing system that regulates the material interests of a country has also been applied to regulate the interests of its art and literature. In the ages of Augustus, of Leo X., and of Louis XIV. homage was paid (by what, for want of a better name, may be termed the intellectual class) to obtain the favour, protection, and patronage of the governing class. In these epochs of art nearly every book was written with the view of earning the goodwill of the ruling sovereign, which, if graciously accorded, was regarded as the hall-mark of the author's intellectual eminence. The architect's designs for public buildings were submitted for the royal approval previous to the commencement of their realisation, and, in like manner, the sculptor's models and sketches were inspected and criticised by his regal patron before the work was cast in bronze or wrought in marble. Thus every man of letters became a vassal of the crown, and every artist was compelled, at least on occasions, to allow his own views to become subordinative to those of the dominant personality of the day.

Before proceeding to discuss the effect upon art of the protective spirit thus displayed by the Government, let us briefly summarise the results achieved by the adoption of the system in each of the three periods we have mentioned.

The Augustan Age.

The Augustan Age, which, in later times, the Romans regarded as being the most prosperous and most distinguished in their annals, was alike notable for the splendour of its attainments in art, literature, and arms. The system of government patronage, then first introduced, became the medium through which literature and the Imperial policy were united, and on that account no period afforded greater opportunities for the peaceful cultivation of letters. Latin literature was thus at its zenith when the majestic world-dominion of Rome was fully established.

The arts of architecture, painting, and sculpture were employed to magnify the state or the chief representative of the state, as in later times they were employed by the Flavian Emperors to conciliate the sovereign people, and Rome was thus embellished with stately temples, magnificent gardens, and bronzes and statuary. In short, Augustus carried out in a city that had recently become the capital of the world those vast public improvements which afterwards enabled him to proudly boast that he had "found it of brick and left it of marble."

The Great Patron of the Italian Renaissance

In his fame as a patron of arts and letters, Leo X. (Giovanni de Medici, 1475-1523), the most magnificent of popes stands alone as a prince who did not merely strike the usual bargain with the intellectual men by whom he was surrounded, of setting princely patronage against abject flattery. Unlike many a patrons, Leo X. (who was a scholar first and a sovereign afterwards) entered into the pursuits, the aspirations, and the ideals of men of genius from a thorough congeniality of tastes and temperament and aided their efforts, not only as patron, but also as a friend. Hence h

DRAWN BY LESLIE WILKINSON, A.R.I.B.A.

This doorway forms the south and most usual entrance to "The Church of the Altar of Heaven," which dates from the 14th century. It is set in a broad surface of plain red-tile walling, and is executed in white marble, with a fine mosaic of the Madonna and Infant Christ between two angels in the tympanum.

contact with the great intellects of the age was far more direct and personal than that of Augustus and Louis XIV. with the eminent men of their time, and Leo X. alone of the three, perhaps, rightly deserved to bequeath his name to a century highly distinguished by its fertility in authors and artists.

Although the Pope did not kindle the genius of Raphael and Michael Angelo, yet great and many were the unique opportunities he offered these distinguished men for the display of their supreme genius. The great intellectual movement for which his age is famous arose, and doubtless could have subsisted, without him; but it is certain that Leo X's enthusiastic encouragement of the Humanists, added to his love of art, and the incomparable greatness with which he presided over and directed the remarkable revival of arts and letters associated with the time, rendered his era the brightest to be found in the whole history of art.

Louis XIV. and His Motives.

Louis XIV. was the absolute ruler, the law-giver, the personification of the courts. His celebrated dictum, "L'Etat c'est moi," was his guiding principle, and never since the time of the Roman Emperors was the doctrine more arrogantly proclaimed. Thus identified with the King, the State was practically non-existent. The King's judgment was paramount, his decision was irrevocable; the expression, "The King wills it so," was accepted as the inevitable. The nobles fought for the glory of the *Roi-Soleil*, and the taxes which crushed the people were raised at his pleasure. The artificial magnificence of the Palace of Versailles is typical of the character and policy of Louis XIV. He built it on a sterile spot, and carried water to it at a prodigious cost. Its gardens reproduced the regularity and majesty which never failed to charm the King, and the splendour of its buildings faithfully reflected the inordinate vanity of this prodigal patron of the arts.

The adornment of the park of Versailles was commenced in 1662, and Perrault's famous colonnade of the Louvre a few years later. Bernini was summoned from Rome to assist the King in his gigantic schemes for the embellishment of the capital, and the services of Mansart, Le Notre, Coyzevox, Lebrun, Tuby, Cafferi, and a host of other artists were in constant demand in connection with his other architectural projects at Versailles and elsewhere.

To stimulate and direct the advancement of knowledge, new learned and scientific academies were established in Paris, and the French School was founded at Rome. In arts and letters, rule and organisation reigned supreme; but the real golden age of literature scarcely touches the reign, because many of the greatest masterpieces of the period belong to the earlier times of Richelieu and Mazarin. Thus, Corneille wrote the Cid in 1636, and after 1646 his powers visibly declined. The earlier works of Molière were produced under the régime of Mazarin, and Racine's best period terminated in 1677.

In the epochs which bear their names the three dominant personalities of the time and country associated with the movement for the advancement of art and letters fostered and supported it for widely different motives—Augustus for reasons of state, Leo X. for his genuine love of art and learning, and Louis XIV. for his personal glorification.

The General Argument.

Whilst it is not denied that, at any rate for a limited time, the principle of the application of royal patronage to art and literature has produced good results, yet the opponents of the system assert that when the highest honours are the exclusive gift of the governing power the marks of favour bestowed are apt to become little more than badges of servitude. It is also contended that the active exercise of royal patronage has a very deleterious influence upon art, and that for one instance in which a sovereign has recompensed a man who is in advance of his age there are dozens of instances of rewards bestowed upon men whose artistic or literary productions afford conclusive evidence that their authors do not rank with the best artists of their time.

Again, those opposed to the system point out that in order to produce the highest degree of excellence in a work of literature or art it is necessary that its author and the public should participate in some common feeling of admiration for beauty and sublimity. When, therefore, the patrons and the arbiters of works of genius are in totally different ranks of life from the authors, an artificial state of art must be cultivated in order to secure the approval of the small and exclusive circle of individuals to whose judgment the works are submitted. Often the very fact that this taste, which the author or artist is called upon to gratify, is more in the nature of a task of artificial study than an effusion of natural feeling tends to produce exaggeration and mannerism. But whilst we are fully prepared to admit the truth and justice of these arguments, we are still of the opinion that the stimulus to artistic production resulting from the alliance between the government and artists on the three occasions to which we have referred was of great benefit to the development of art. The ephemeral nature of the connection was, in each case, due to causes not under the control of the respective regal patron, who should be honoured by the civilised world for having accomplished so much, rather than cavilled at and blamed because the result of his efforts sometimes fell short of the ideal.

C

THE LIGHTING OF SCHOOL BUILDINGS.*

By G. Topham Forrest,
Architect to the Northumberland Education Committee.

In the following paper my intention is not to touch upon the principles involved in the lighting of a new school building, but more especially to discuss the architect's part in the re-modelling of old buildings, and to lay before you some suggestions as to the best types of classroom windows, which may perhaps afford a field for discussion.

As regards the question of site, the value of high ground is inestimable, as it secures more light by reducing the height of obstructions, and gives a freer play for the sun's rays. The building should be placed so that it is possible for each child to see the sky from his desk. The control of trees should be secured with the purchase of the site. If they do not interfere with the lighting of the building, well and good, but this point should be carefully considered when inspecting suitable ground.

The Question of Aspect

The question how to secure sunlight for all the rooms during some part of the day has led to considerable discussion as to the best direction for a building to face. Buildings should not be placed so as to coincide with the points of the compass, otherwise the north-side rooms, if lighted on one side only, are cut off from the sun, while south rooms may become too warm in hot weather. To avoid this the building should face the middle points of the compass. By this arrangement each side receives the sun at some time during the day. A frontage of this sort makes south-east rooms most desirable, south-west next, then north-east, while the north-west is least desirable, as the effects of the sun are only felt after the children have gone for the day. These distinctions, however, must not be carried to an unnecessarily fine point, but when such a site can be obtained as readily as another it should be given the preference.

If a building is so planned that it is impossible to secure the sun for each room, the deficiency should be made up by increasing heating and ventilation.

Having determined the character of the building, be careful to put the light in the rooms used for school work. This, of course, is the mandate of common-sense, but how many times do we see that these considerations are not always regarded, *e.g.*, assembly halls put on the south side, teachers' rooms monopolising windows which should go to light classrooms, and staircases often on the side of the building having the best light.

Proportion of Window Area.

The relation of window space to floor space should be at least 1 to 6.

Lighting should be from the left, and it must be borne in mind that the light from the highest part of the room is by far the most valuable. That which comes through the lower panes goes to the floor. For reading purposes, front lighting is exceedingly bad, as the light is thrown on the binding of the book instead of on the page. Of all possible combinations of bilateral lighting, that with windows at the left and right is much to be preferred, though care should be taken that the lighting from the right hand is shaded, leaving the chief source of illumination from the left.

*Abstract of a paper read before the Congress of the Royal Sanitary Institute at Cardiff on July 16th, 1908.

Width and Structure of Windows.

So many varieties of classroom windows are in vogue, both as regards design and construction, and as regards ventilation, that it will be sufficient here to outline a few of the main principles which determine their use. It is well to remember when designing windows that the light should enter the room as a unit; hence there will be no distinguishing cross lights, no distinctly outlined shadows, and one light will shade into another without any visible lines: in other words, there should be broad piers or mullions between the daylight openings. On that account I am not an advocate of planning classrooms having only two windows, as this necessitates a considerable amount of wall surface between them. I am of opinion that the best and most suitable form of classroom window for an ordinary sized classroom to accommodate, say, 50 or 60 children, is a three-light one; but it is hardly possible to construct brick piers of sufficient strength in a building of any height that will not interfere considerably with the light. Eighteen inches seems to be the width usually adopted, but as this width throws a shadow on the desks nearest the window, cast-iron mullions are, I believe, now used (although I have not seen any). These are cast with heavy webs, and with the window-frame bolted directly to them. In this way it is possible to put the windows sufficiently close, and at the same time to provide sufficient strength. When brick piers are used they should always be bevelled on the inside.

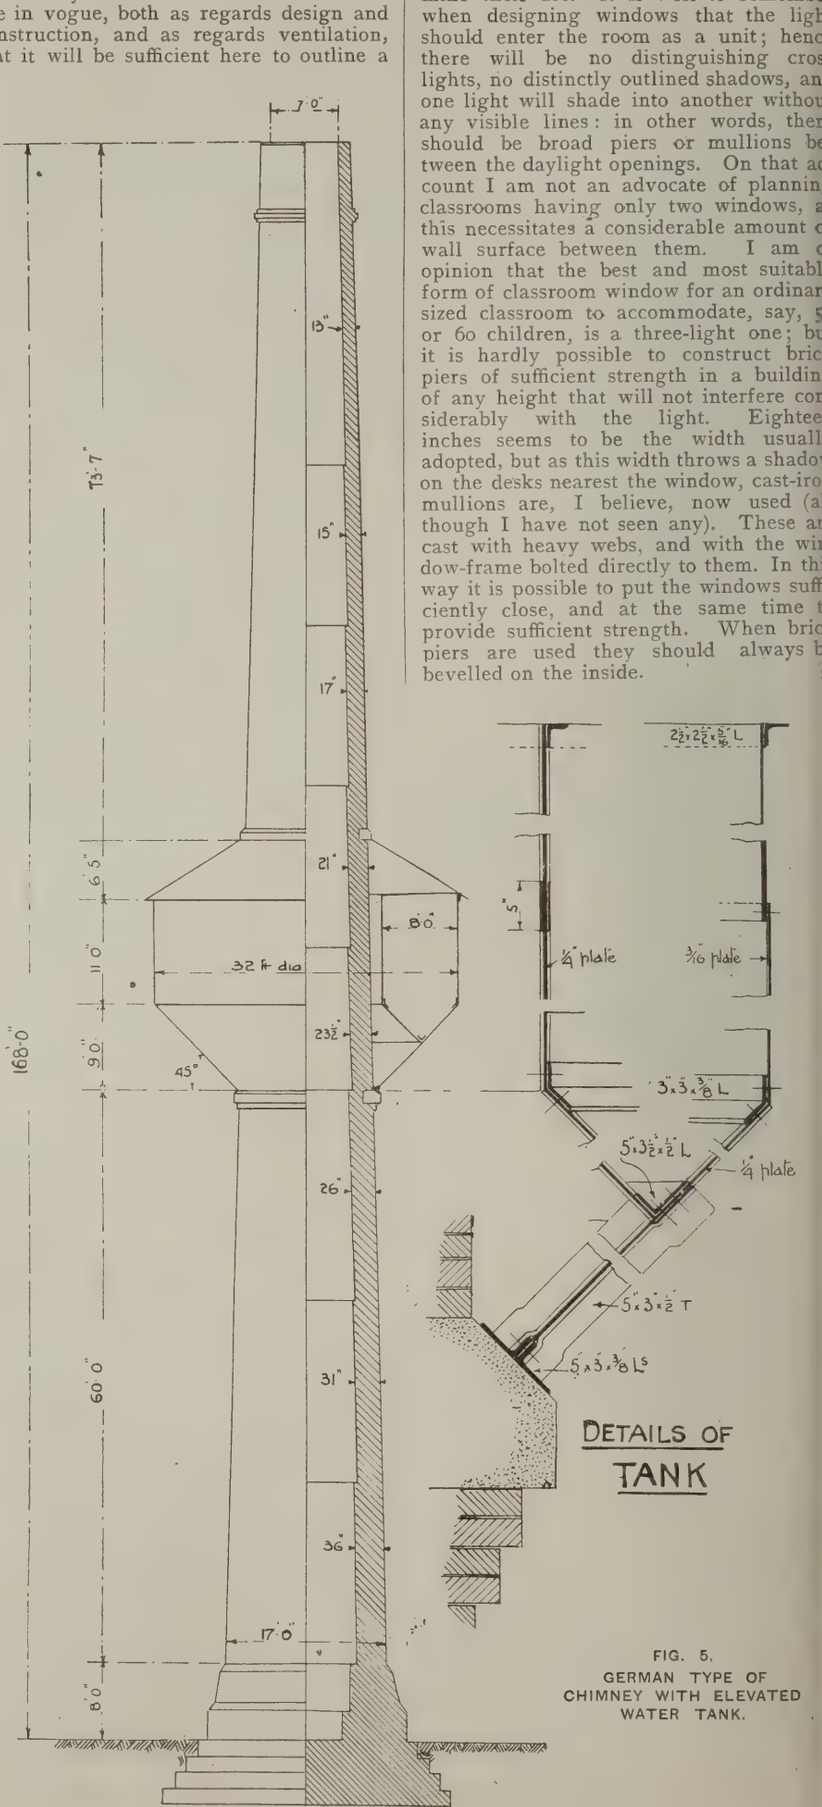

FIG. 5.
GERMAN TYPE OF CHIMNEY WITH ELEVATED WATER TANK.

In furnishing a classroom special care should be paid to securing

School Desks of Practical Construction.

The eyesight of the pupils may be seriously impaired, the desks may be too high or two low, and the advantage of having a good building may be counter-balanced by this mistake.

Some little time ago the writer was called upon to report very fully on the question of adjustable desks for secondary schools, and some valuable statistics were volunteered by various principals, who all agreed as to the absolute necessity for grading the heights of the desks in a classroom to suit the pupils. In a classroom of a secondary school three different sizes are commonly met with, and, in my opinion, some such system would be advantageously applied in the furnishing of our elementary schools. The failure to adjust the desks to suit short-waisted children is a neglect of duty to care for the eyesight.

MODERN PRACTICE IN TALL CHIMNEY CONSTRUCTION.

By Hector St. G. Robinson.

(*Continued from page 83, No. 703.*)

A typical example of a stock brick chimney is shown in Fig. 3. It was built to serve both for the destructor station and the electricity installation at the King's Road works of the St. Pancras Borough Council. It is 207ft. 6in. in height, and stands upon a concrete slab 36ft. square and 8ft. thick, resting upon the London clay at a depth of 23ft. 6in. below the ground surface. The shaft is built of stock bricks and Ruabon red brick quoins and strings. The capping is formed of Derbyshire stone, three courses in depth and eight stones in each course, which are all cramped together with copper cramps. For a height of 80ft. from the bottom the flue is lined with fire-brick, between which and the main structure a 3in. air-space is left, ventilated with openings from the outside. The diameter of the flue is 9ft. at the base to 7ft. 9in. at the cap. This chimney, although very graceful in appearance, is very heavy. The position it occupies is not very exposed, and there is no apparent justification for the excessive wall thickness. As a comparison, one of the two brick chimneys recently built by Messrs. Nicholls and Reynolds, engineers, of Westminster, in an exposed position on the sea-coast is instructive. This chimney (Fig. 4) built for the Central Zinc Co., Ltd., of Seaton Carew, Durham, on the Alphons Custodis system, is extremely light, and is an example of what can be done in districts where no antiquated building by-laws are in operation. Owing to the high temperature of the gases entering this chimney, it was considered advisable to place wrought-iron bands around the stack. Otherwise, the details given are self-explanatory.

A type of structure rather common in Germany is a useful combination of chimney and elevated water tank (see Fig. 5). The economy of such an arrangement is obvious. This type of chimney can be computed in practically the same manner as an ordinary brick chimney. The area exposed to wind is greater, and the worst condition as regards stability is when the tank is empty and high winds are encountered.

Protection from Lightning.

The protection of tall brick chimneys from lightning is most important, and numerous improvements on the old "lightning rod" have been evolved from time to time. Many years ago a writer on the subject recommended the use of a heavy band or coronal at the top of the chimney, with copper points 1ft. high at intervals of 2ft. on the circumference. This method of protection is now coming into general use. The common practice in this country for conductors is a copper tape about $\frac{3}{4}$in. by $\frac{1}{8}$in., terminating in an earth terminal composed of a 3ft. by 3ft. by $\frac{1}{16}$-in. copper plate. It should be borne in mind that the best earth terminal is water, and when a deep well or other large body of water is at hand the

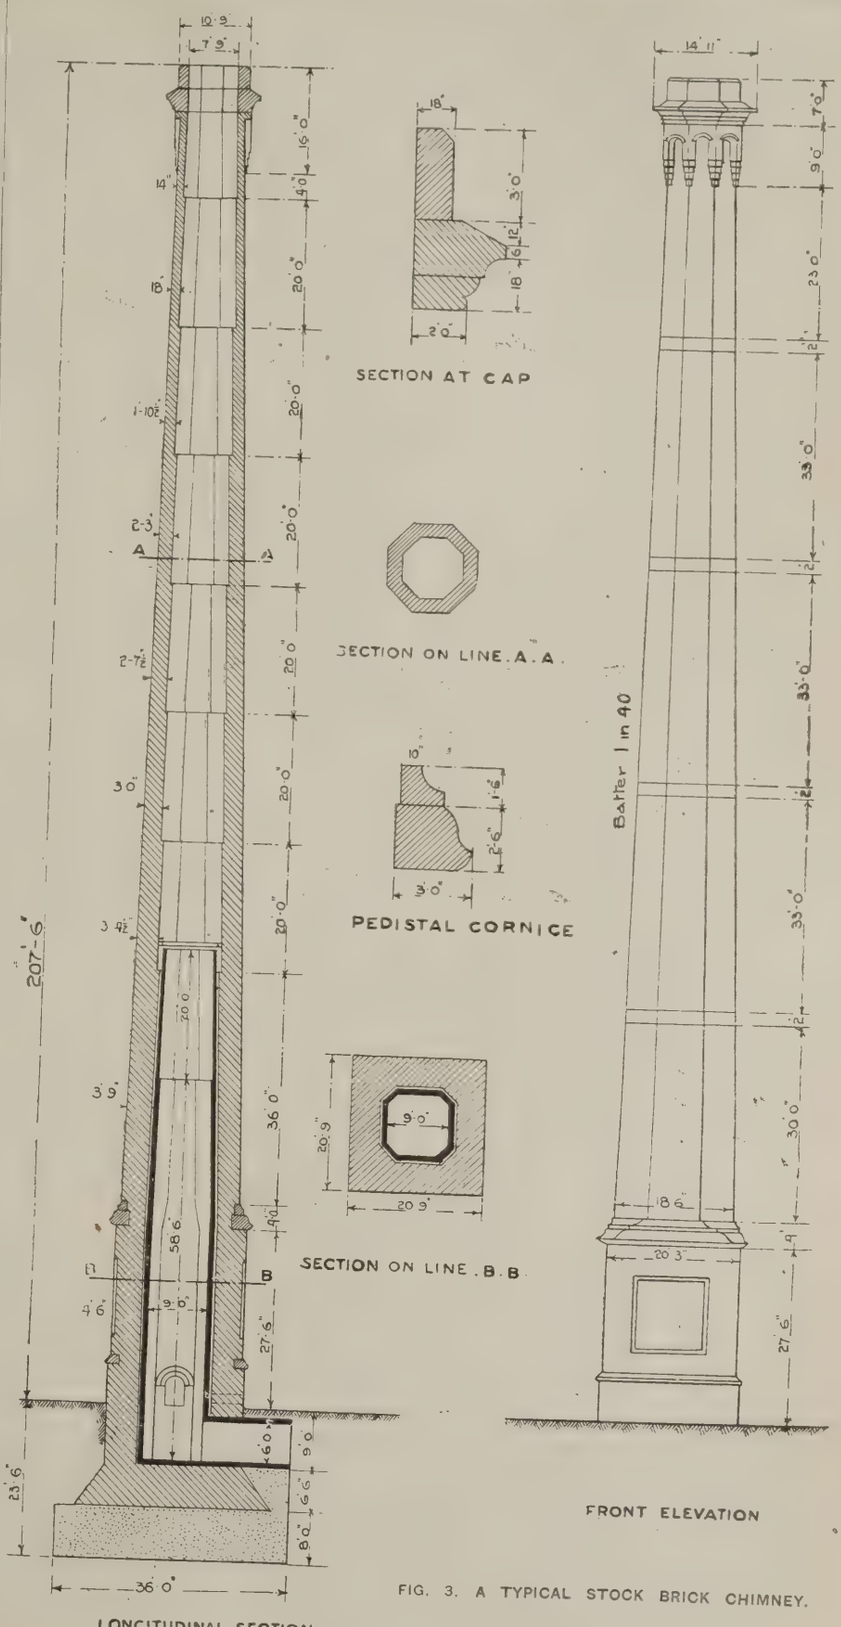

FIG. 3. A TYPICAL STOCK BRICK CHIMNEY.

conductor should be carried down into it.

In a recent paper which appeared in the Journal of the American Society of Naval Engineers, Mr. W. M. Hopkins discusses at length the modern theory of protection against lightning. An abstract of this paper, together with a portion of the specification of the apparatus for the protection of brick power plant chimneys, as issued by the United States Navy Department, appeared in THE BUILDERS' JOURNAL of September 25th, 1907, and should be referred to.

(To be continued.)

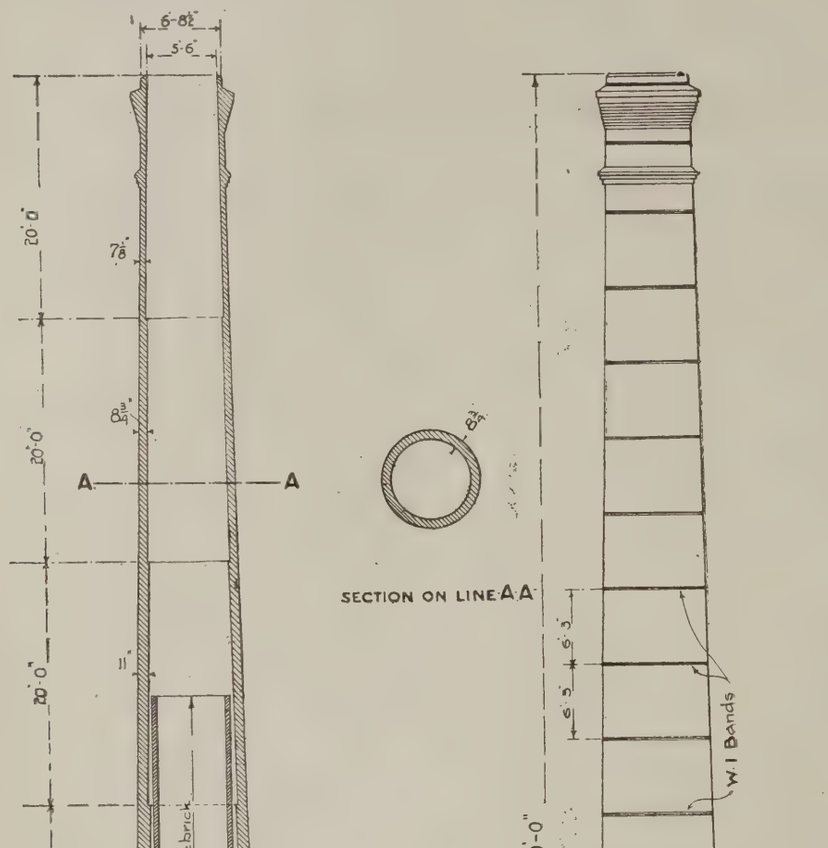

FIG. 4. CHIMNEY AT SEATON CAREW, DURHAM, ON THE ALPHONS CUSTODIS SYSTEM.

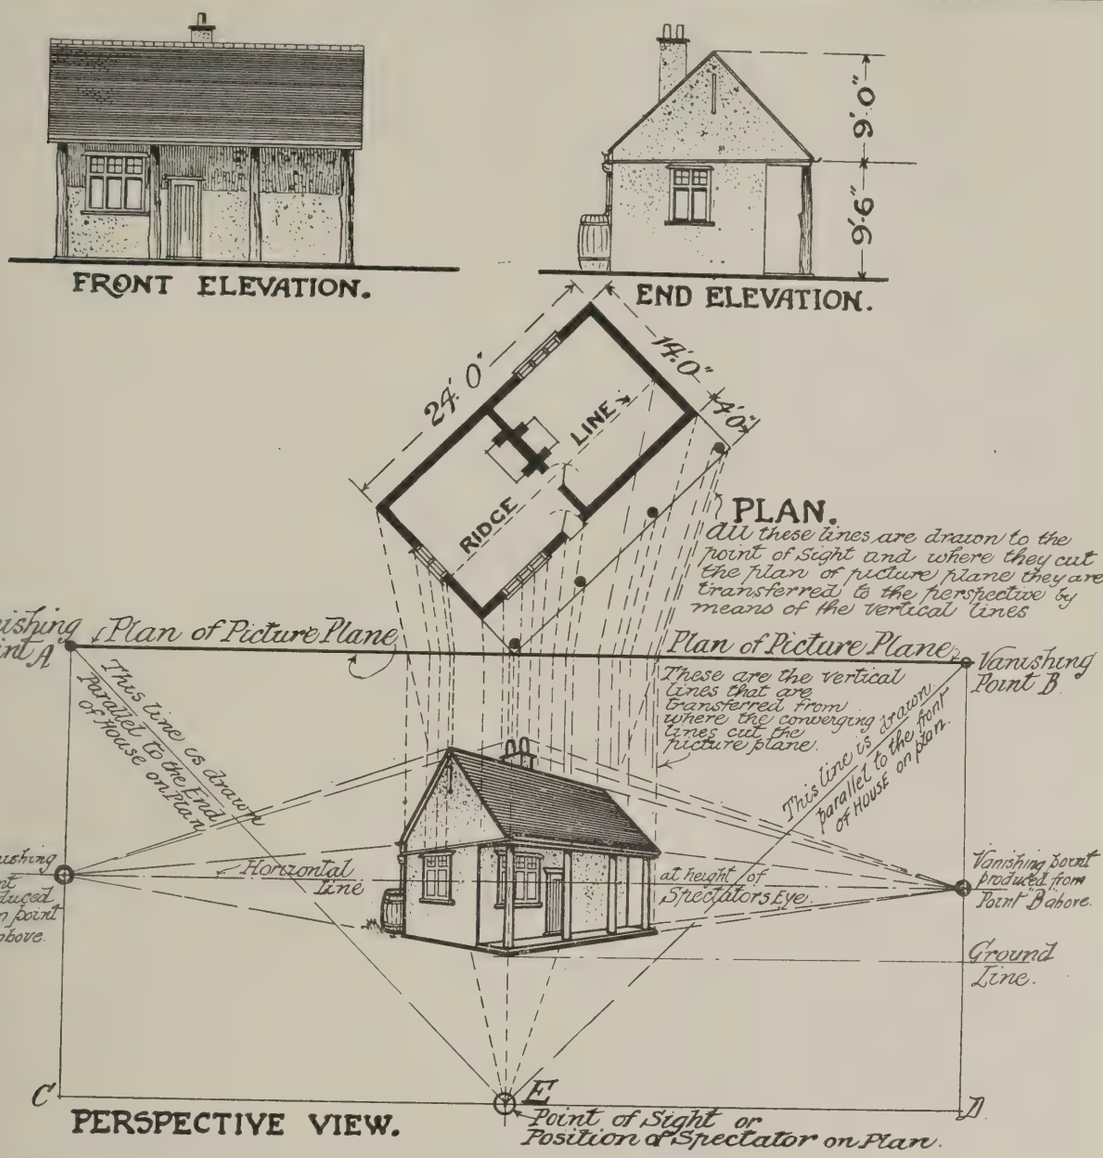
ARCHITECTURAL PERSPECTIVE.

By W. E. B.

Perspective drawing is an everyday requirement of the architectural and engineering draughtsman, yet, out of nearly 100 junior draughtsmen whom the writer interviewed in connection with applications for positions in an office where a knowledge of architectural perspective was necessary, only 10 were able to prepare a sketch or drawing in perspective accurately, or quickly enough for practical purposes.

This want of knowledge upon so useful a subject is caused chiefly by the unpractical nature of most of the books that are supposed to teach the rudimentary principles of perspective.



Therefore, in preparing these notes, the writer's aim has been to provide an example showing in a clear and simple manner how a building, for instance, can be readily and easily drawn in perspective after a few hours' study.

Linear perspective is based on the fact that a straight line passes from any point in an object at which the spectator is looking to the eye of the spectator, a ray of light carrying with it the impression of the point of the eye.

If there be two objects which in reality are of the same size, but one is farther away from the spectator than the other, the farther one will appear smaller—much smaller if the distance between the objects be great. This apparent difference in size is explained by the convergence of the straight lines or rays of light from every point in an object to the eye, and it is the primary principle upon which all the rules of linear perspective are based. It can, therefore, be taken as an axiom that parallel lines which recede from the spectator appear to converge, and, produced far enough, eventually appear to meet at a point.

Ruskin, in the preface of his book, "The Elements of Drawing," describes a very good method by means of which the student can readily understand perspective. He says: "The best way the student can learn it by himself is by taking a pane of glass, fixed in a frame, so that it can be set upright before the eye at the distance at which the proposed sketch is intended to be seen. Let the eye be placed at some fixed point opposite the middle of the pane of glass, but as high or as low as the student likes; then with a brush at the end of a stick, and a little body colour that will adhere to the glass, the lines of the landscape may be traced on the glass as you see them through it. When so traced they are all in true perspective. If the glass be sloped in any direction the lines are still in true perspective, only it is perspective calculated for a sloping plane, while common perspective always supposes the plane of the picture to be vertical."

Now, to make a perspective drawing of a building it is necessary to have first of all the plan, a front or back elevation and one end elevation. Having these ready, the draughtsman should proceed as follows:—First determine the point of sight, or the position of the spectator. This distance from the building should be at least the length of a diagonal line from corner to corner of the plan of the building; it is, in fact, always as well to be a few feet further away from the nearest point than this, because the further one is from the object (up to a reasonable distance, of course) the better view one gets of its general character and proportions.

Note: A.B.C.D. represent the Picture Plane in Elevation. This can be taken as the plane of Glass mentioned by Ruskin.

Having determined the point of site in elation to the plan, mark it on the drawng paper by means of an ordinary pin stuck upright into the paper and the drawing board, as indicated by E on the accompanying illustration. Now, from ill points of the building visual rays are ndicated on the drawing by converging lotted lines; before drawing these, howver, the line to indicate the plan of the picture plane should be drawn, touching he point of the building on plan which s nearest the spectator; and this picture-plane plan line is always drawn at right ngles to a straight line from the point where the spectator stands to the nearest oint of the structure on plan—in the preent case the corner of the verandah floor ear the verandah post.

Next find the vanishing points, which ndicate the extent of the spectator's vision ither to the right or left of the building. rom E draw a dotted line E, B, paral-el to the front of the house on plan and ontinue this line until it intersects the ne of the picture plane. The point of ntersection B is the vanishing point required.

From E to A also draw a line parallel to the end of the house on plan to intersect the line of the picture plane at A; the point of intersection is the left-hand vanishing point.

We are now ready to draw the converging lines to indicate the visual rays.

From the plan draw lines as shown to the point of sight E. If preferred (and I thing it makes the work clearer), these lines can be stopped where they cut the picture-plane plan line. Then from the points of intersection transfer them to the perspective drawing as shown. (If the drawing is a large one, it is better to make the points where the converging lines cut the picture-plane line on a separate slip of tracing paper, and then transfer them to their positions on the horizontal line of sight).

Having proceeded so far, it will be as well to indicate by straight lines the area of the elevation of the picture-plane A, B, C, D. Next mark in the ground line, or the lowest point of the object. Then draw another line parallel to this ground line, about 5ft. 6in. above it, according to scale. This is the horizontal line of sight. If the house is drawn to a scale of $\frac{1}{4}$in. to 1ft. on elevation, the distance of 5ft. 6in. should also be drawn to $\frac{1}{4}$in. scale. Where this horizontal line, which should be at the height of the spectator's eye, cuts the lines A, C, and B, C respectively, these points will be the positions of the vanishing points on the elevation of the picture plane, and should be marked by pins, as was previously done to indicate the point of sight, so as to facilitate the drawing of the converging lines as shown; the pins acting as pivots, as it were, for the ruler or tee-square. Of course, if the eye be raised, the horizontal line of sight will also rise with it.

It may be mentioned here that the point where the object touches the plan of the picture plane becomes the measuring line from which all heights are measured off according to scale, and then drawn to the vanishing points.

For the sake of clearness all the converging lines have not been shown on the accompanying illustration, but only sufficient for the student to follow out the idea easily: more dotted lines would only tend to make the drawing complicated.

THE NATIONAL FEDERATION OF BUILDING TRADES' EMPLOYERS.

Conference at Birmingham.

The half-yearly meeting of the National Federation of Building Trades Employers of Great Britain and Ireland was held in the Council House, Birmingham, on Wednesday last. Mr. C. H. Barnsley (president), Birmingham, occupied the chair. The Lord Mayor (Alderman H. J. Sayer) attended the opening proceedings, and gave the delegates a hearty welcome to the city.

Among those present were three Colonial representatives, namely, Mr. P. Clark (president of the Johannesburg Association), Mr. J. M. Pringle (ex-president of the Master Builders' Association of New South Wales), and Mr. A. E. Parfitt (of Bloemfontein, formerly a member of the Newport, Mon., Association), each of whom gave some account of the building trade in their particular Colonies. Mr. Clark said they had experienced some trouble in securing an alteration in their conditions of contract, but he was pleased to say the matter had now been brought to a successful issue, embodying the conditions arrived at in England about eight years ago, with the exception of a few alterations necessitated by local conditions. As a result their status had been considerably improved, and all this had been brought about purely and simply through their being combined in local associations and a national federation.

Mr. J. M. Pringle, speaking of the building trade in Australia, said they had had a troublous time, owing to the interference of a political party—the Labour party—which had existed in Australian politics for sixteen years. One of the aims of that party was to have a system of State employment so far as public works were concerned, and they gradually attained their object in New South Wales to a great extent, and also in other Colonies.

Mr. A. E. Parfitt observed that when he got to Bloemfontein in 1903 there was no building trade association, but before he had been there eight or nine months he was able to induce the builders to form an organisation. It was accordingly started, and he had the honour that day to be the president of that Association.

Half-Yearly Report.

The sixtieth half-yearly report of the Federation was presented. With regard to the building trade, no general improvemen could yet be reported, and in some parts it is stated to be worse than a year ago.

In regard to conciliation boards it was reported that during the past half-year a good many notices from the operatives in the northern centre and elsewhere had matured, and these boards had been freely made use of. A special committee had been endeavouring to induce the outstanding trades to come into the scheme, but the operative plasterers preferred to maintain the agreement between the Federation and the N.A.O P. The operative plumbers did not consider the time ripe for asking their members to reconsider this question, while the operative painters do not at present view the scheme with favour. The Amalgamated Builders' Labourers' Union had made application to be admitted to the scheme, and, subject to certain formalities, their application had been accepted. (This Union has branches in the following towns: Aston, Birmingham, Barnsley, Bradford, West Bromwich, Burton-on-Trent, Derby, Doncaster, Hull, Hinckley, Huddersfield, West Hartlepool, Kidderminster, Leicester, Leeds, Loughborough, Malvern, Middlesborough, Manchester, Newark, Newcastle-on-Tyne, Shipley, Stockton-on-Tees, Scarborough, Selby, Sunderland, Smethwick, Sheffield, Tamworth, Worcester, Wakefield, York.)

Reference was made to the case of *Smithies* v. *The N.A.O.P.*, heard by the Lord Chief Justice on May 13th and following days, the judgment in which was considered to be very unsatisfactory, because while it was in favour of Mr. Smithies, as against the two workmen who broke their contracts with him, for £25 damages and costs each, the action as against the N.A.O.P. and the local secretary was dismissed with costs. A request had been laid before the Administrative Committee that they should recommend the Federation to grant further financial support for a projected appeal. The committee, however, were of opinion that the appeal would not prove successful, and, consequently, could not see their way to make any recommendation to the general meeting for a further grant.

It was recorded that arrangements had been made by which THE BUILDERS' JOURNAL would become the official organ of the Federation.

Other matters referred to in the report were the Building Accidents' regulations (already dealt with *in extenso* in these columns), the Miners' Eight Hour Day Bill (against which the Federation had lodged a strong protest), the Sweated Industries Bill, the second International Congress relating to the industry of building and of public works, to be held in Paris from September 21st to 24th (when the Federation will be represented by their secretary); the Housing and Town Planning Bill, from which it seems probable that the building trade will reap some benefit, by reason of the considerable expenditure of public money which will be entailed in carrying out the provisions of the Bill; and the progress of organisation within the Federation, in connection with which it was reported that an earnest attempt was being made in the Manchester district to effect a much-needed reform by absorbing the separate trade associations into a general Building Trades Association.

On the motion of the President, the report was adopted.

National Form of Contract.

Mr. Macfarlane moved the following recommendation of the Administrative Committee: "The conditions of contract issued by the R.I.B.A., and approved of by this Federation, having now been in continuous use since July, 1903, during which time they have been found to give general satisfaction, the Council be, and are, hereby instructed to approach the R.I.B.A. with the object of obtaining their support in a united effort to extend the use of these conditions to districts that have not already adopted them." He said it was a very important thing for the trade that they should have a uniform form of contract, and that it should be a just contract. As they knew, some had already adopted the new form, but others stuck to the old style. What they wanted throughout the country was to have the contract acknowledged as a fair and equitable form. In various parts of the country it was not acknowledged, and they wished to bring it before the Royal Institute of British Architects, so that they might talk about it and urge their fellow members to adopt it. It was a fair thing to builders, and they should leave no stone unturned until it became universal.

The President suggested the addition of the words after "R.I.B.A." in the resolution, "with the co-operation of the Institute of Builders, should they think it desirable."

Mr. Macfarlane accepted the alteration and Mr. Hope seconded the motion. He said that, seeing that the Institute of Builders were the pioneers in the matter it would not be derogatory to the Federation to call them into consultation.

Mr. Biggin moved, as a supplementary resolution, "That the Administrative Committee approach the Government Departments and the various Association and different local authorities in order to obtain recognition of the national form of contract, and that the Federation and Local Associations be recommended to follow up any action of the National." He said this National form was being adopted very slowly throughout the country. The resolution which had already been passed should give the movement a little filli In the provinces they found very gre difficulty in getting a satisfactory agre ment with the local bodies and wi Government Departments. The resoluti was intended to push on the National for of contract, and to get all local governi bodies and the various Government D partments to adopt it.

Mr. Thompson seconded the motio He remarked that almost every one them, at one time or another, had do work under local authorities where th thought many of the forms or contra were very onerous, and contained claus which were derogatory to members of t trade. Many of such contracts had be drawn up by solicitors who were anythi but in sympathy with the builders. T time had come now when they ought push the matter, and try to induce ev local authority to adopt the appro form. Recently it was put before Local Government Board, and some the officials there, in reply to a quest as to whether it might be adopted b local body, said they saw no objecti and commended it very highly.

The motion was passed.

Mr. Wright said that in order to furt the policy of endeavouring to extend form of contract as widely as possible wished to move a resolution which thought would go a long way in t direction: "That this meeting requ the Administrative Committee to cons the desirability of approaching the o societies of architects with the view of ting them to adopt the National form contract." He said the form of cont had been drawn and arranged by Royal Institute of British Architects conjunction with the builders. T were, he believed, two other societie architects that they ought to appro and the resolution requested the c mittee to approach them with a vie getting them to adopt the form.

Mr. Blackburn seconded the motion

Mr. Cook pointed out that there wa Institute of Irish Architects, and should be glad if they could be incl in the motion, so that the Federa might open communications with the

Mr. Wright said the resolution w enable them to include the Irish or other Institute.

Mr. Hope thought that in whatever did he doubted whether they woul

wisely advised in acting without the British Institute.

The President said that the Administrative Committee would look at the matter from the point of view of the suggestion of Mr. Hope.

Mr. Bowen supported the proposition, but said he should like to go a little further. He thought it would be well if the forms of contract could be sent to city authorities. He should like to see them go to town clerks, city clerks, county councils, clerks of the peace, and such like people. It was a well-known fact that engineers to city and county authorities had their own ideas, and they were pressing them forward, and not going in for broad lines such as were adopted throughout the country by the building trade and architects. He was alarmed the other day, for instance, to learn that even in the advanced city of Birmingham there were contracts being signed without an arbitration clause. If for no other reason than that, he thought the resolution was a good one.

The President agreed that the resolution was valuable, and it was carried.

The action of the Administrative Committee in entering into an agreement by which THE BUILDERS' JOURNAL became the official organ of the Federation was approved, and a resolution was passed earnestly requesting the respective Federations and Local Associations to do their best to make the agreement a complete success for all concerned.

Parliamentary Action.

Mr. Hope explained that a letter had been received from the Earl of Wemyss, requesting the consideration of the following resolution, which it was proposed to move in the House of Lords:—"That central societies for the advancement of trade, commerce, industry, law, science and art be invited to name three Peers each, who may be willing to represent their interests and speak and act in their name, and that the names of such Peers be entered in the Journals of the House. Further, that the selection of the societies to whom this privilege is to be accorded be left to the Lord Chancellor and Lord Halsbury, and to Lords Crewe and Lansdowne, the respective Leaders of the Government and Opposition." Mr. Hope went on to say that they were one of the few trade organisations that had not a member in the House of Commons to voice their views. The trade unionists had their own members, whom they paid and maintained, and he knew an association that was not a trade union which had not a member of its own in the House but it had made an arrangement whereby it was able to call on a member to voice their opinion as occasion arose. They had a member on the Government side, one on the Opposition side, and one in the Labour group. The suggestion of Earl Wemyss was somewhat similar to that working arrangement, and it was proposed that there should be peers who would be at the disposal of the Federation. The peers who would be selected would be in the House in case of necessity, and any representation would be sympathetically received and intelligently placed before the House, seeing that the members would be made conversant with the particular question by the Federation. The matter had been before the Council, and they were inclined at first to leave it, but as there would be nothing to the disadvantage of the Federation, but everything to its advantage, it had been decided to submit the resolution to the meeting.

Mr. Davidson seconded the proposition. He said it was highly desirable that there should be someone in the House of Commons who could give an intelligent interpretation of the wishes and desires of the Federation, or if any resolution were introduced which it was considered should be seriously amended, they could bring sound and intelligent reasons to bear, and could ask with confidence for the support of other members.

The resolution was passed.

On the proposition of Mr. Storr, seconded by Mr. Matthews, it was decided to hold the next meeting in London.

The Federation and the N.A.O.P.

Considerable discussion followed on a proposition by Mr. J. B. Johnson, of Liverpool, in reference to the agreement between the Federation and the National Association of Operative Plasterers in regard to disputes. Mr. Johnson said this agreement had been more or less a source of contention, and, in his opinion, the time had come when the agreement should be revised. He moved the appointment, therefore, of a special committee to deal with the question.

Subsequently, however, he accepted the terms of an amendment proposed by the president (Mr. Barnsley), to the effect that the Administrative Committee be requested to consider the desirability of amending or ending the N.A.O.P. agreement, and confer with the National Association of Master Plasterers thereon, and report to the annual meeting, and that one plasterers' representative from each Centre be invited to sit for that purpose.

This proposal was adopted.

The Conciliation Scheme.

Mr. Storr moved "That the consideration of the question of admitting plasterers' labourers to the conciliation scheme be deferred to the next half-yearly meeting, and that meanwhile this question be referred to the Federations for consideration and report." He said application had been made by the builders' labourers in certain districts to be parties to the conciliation scheme. The Conciliation Board was unanimously of opinion that where the builders' labourers were recognised by the employers, and they signed the rules, if they desired to become parties to the conciliation scheme they should be allowed. When the Conciliation Boards were first established, it was only intended that they should apply to certain trades unions, such as the bricklayers, masons, carpenters and joiners, and painters and plumbers. The question of labourers was never under consideration. If the labourers were to be admitted into the scheme, it would have to be approved not only by the National Association, but by the various centres forming the National Association. The resolution he moved was to have this dealt with in a proper form. The matter was one which ought to be conceded, but there were districts where the builders' labourers had never been recognised and had no working rules with the employers.

Mr. Matthews seconded the proposition, which was agreed to.

Building Operations and Engineering Works' Bill.

Mr. Macfarlane said that, as many members would know, a Bill had been presented to Parliament by the Home Secretary for the purpose of widening the scope of the present Factory Act. As they would remember, the Home Secretary appointed a committee to suggest regulations for building operations. The Bill was to empower the Home Secretary to include building operations as a dangerous trade. At present all building operations were not under the Factory Act as a dangerous trade, only those concerned with buildings over 30 ft. high, and where machinery was used. The new Bill would empower the Home Secretary to enforce new regulations, such as had been suggested by the Departmental Committee, to all building operations—to buildings below 30 ft., and where no machinery was used. It also empowered the Home Secretary to compel builders to affix registers on new buildings and, where the buildings were too small, to fix them in the office of the builder, and certain reports required by the new regulations had to be entered. At the present time the factory inspectors administered the Factory Act, but under the new Bill so far as building and engineering operations were concerned, the onus of administration was put on the Town Council and County Council inspectors. The Factory inspectors were to have the right of stepping in should the Town Council and the County Council inspectors fail, as they thought, to administer regulations as they should do. At the present time the factory inspector had the almost entire administration of the Act. The new Bill introduced the element of the Town and County Council inspector. It would be well for members to keep their eyes and ears open as to what was going on, so that when it came before Parliament they might use their influence with members of Parliament or take other steps to safeguard their interests. He proposed that the matter be left in the hands of the Administrative Committee.

Mr. Blackburn seconded the motion, and it was passed.

A Builders' Foremen's Association.

The following resolution was passed:—"That the National Federation be requested to consider the advisability of forming an Association of Builders' Foremen whose members would be quite independent of trade unions."

This concluded the business of the meeting.

In the evening the President of the Birmingham Master Builders' Association (Mr. F. G. Whittall) gave a reception at the Botanical Gardens, Edgbaston, where supper was served in a marquee on the lawn.

THE LATE SIR JOHN EVANS, the well-known antiquary, who died on May 31st last, aged 84, left estate which has been proved at £147,347 gross.

THIS YEAR'S GRAND PRIX DE ROME has been won by M. Louis Boussois, a pupil of M. Pascal. The subject was an institution of medicine and pharmacy.

AT THE FRANCO-BRITISH EXHIBITION, Messrs. Chance Brothers and Co., Ltd., of Lighthouse Works, near Birmingham, show an exhibit of optical apparatus for lighthouses, as well as ship lights, the "Harcourt" 10-candle standard Pentane lamp (as adopted by the Metropolitan Gas Referees as their standard for testing candle-powers), and a sunshine recorder. The firm's works are equipped with every possible mechanical appliance for the completion of lighthouses, from the iron tower to the incandescent oil burner, and include special plant for the manufacture, grinding and polishing of the optical glass required.

R.I.B.A. MIDSUMMER EXAMINATIONS.

Pass List.

The following are the results of the Midsummer examinations of the Royal Institute of British Architects:—

Preliminary Examination.

The Preliminary Examination, qualifying for registration as Probationer R.I.B.A., was held in London and the undermentioned provincial centres on June 15th and 16th. Of the 188 candidates admitted 21 claims for exemption from sitting for the examination were allowed. The remaining 107 candidates were examined, with the following results:—

District	Number Examined	Passed	Relegated
London	79	60	19
Birmingham	6	5	1
Bristol	13	9	4
Cardiff	9	6	3
Glasgow	2	1	1
Leeds	14	12	8
Manchester	33	25	8
Newcastle	11	10	1
	167	128	39

The passed and exempted candidates—numbering altogether 149—who have been registered as Probationers, are as follows:—

C. D. Allderidge (Hull).
R. C. Arnold (Ilford).
G. O. Barrass (London, S.E.).
H. A. Bastable (Southport).
F. H. T. Bell (Burton-upon-Trent).
J. C. Beswarick (Cambridge).
H. J. Bionstinge (London, W.).
H. H. Bond (Plymouth).
E. F. Bothwell (Forest Gate).
C. F. Bowhill (Thornley, co. Durham).
J. V. Bowring (Eastwood).
W. W. Brindle (Beckermet).
K. S. Broad (London, N.W.).
M. C. Broad (London N.W.).
W. Broughton (Groby, Leicester).
M. Brown (London, W.C.).
F. A. Buckley (Llandaff).
C. H. Buckley (Boscombe).
A. S. Burnett (Shawford Down).
J. J. D. Burt (Dartmouth).
R. O. Caldwell (Penzance).
C. B. Chadwick (Dewsbury).
R. B. A. Chambers (London, N.W.).
F. J. Chant (Gillingham).
G. E. Charlewood (Newcastle-on-Tyne).
H. R. Chasseaud (Alexandria, Egypt).
R. A. Cheers (Twickenham).
S. W. Chester (Nelson).
J. Clack (London, S.W.).
J. A. Clarke (Manchester).
F. Clemes (Weston-super-Mare).
A. R. Clucas (Douglas).
E. J. Connock (Yeovil).
G. A. Cosser, (Fareham).
B. Crabtree (Todmorden).
G. L. Crocker (Swansea).
B. Dangerfield (Brentford).
T. L. Daniel (Ilford).
P. F. Dixon (Ilkley).
T. A. Dryden (Landore).
R. A. Duncan (Bristol).
J. M. Eaton (London, W.C.).
T. G. Ellis (London, W.).
E. Fincham (Colchester).
I. C. Fowell (Beccles).
C. R. Fowler (London, N.).
C. P. Garrard (Ipswich).
B. P. Gaymer (London, W.C.).
G. H. Gibbs (Bristol).
H. B. S. Gibbs (Sheffield).
W. L. Gissing (Wakefield).
R. H. Goodsall (Whitstable).
G. H. Gray (North Shields).
F. N. Groves (Newport, Mon.).
H. V. de C. Hague (Blackpool).
P. E. Hale (London, N.E.).
E. B. Hamilton (Haslingden).
P. W. Hannah (Nottingham).
C. K. Harper (Woodford Green).
F. G. Hawkins (London, N.W.).
B. R. Hebblethwaite (Beckenham).
H. J. Higgs (Goring).
C. J. Higson (Newcastle, Staffs.).
C. B. Hill (Todmorden).
G. W. Hill (Leeds).
G. Hines (Newcastle-on-Tyne).
W. Holden (Bishop Auckland).
F. W. J. Howell (Porthcawl).
V. J. Hull (Garstang).
F. L. Johnson (London, N.W.).
H. D. Kidd (London, N.).
A. J. Knott (Weston-super-Mare).
E. C. Lavender (Walsall).
H. B. Leighton (Sheffield).
W. J. Lingley (Manchester).
R. Lowry (London, W.).
W. F. Lucas (Torquay)
A. M. Luty, Elland, Yorkshire).
R. Lynn (Belfast).
M. Y. Maclagan (Edinburgh).
R. H. Maddock (Belmont).
B. J. S. McFie (Oxford).
J. E. Marchinton (Sheffield).
T. Maxwell (Manchester).
S. D. Meadows (Leicester).
E. Meredith (Newbridge-on-Wye).
E. R. Midgley (Leeds).
R. N. S. Mills (Urmston).
W. G. Mooney (London, E.C.).
J. H. Morrison (Gloucester).
W. Mossom (North Shields).
A. H. Mottram (London, N.W.).
J. J. Nathanielsz (Cudworth).
H. B. Neely (Bromley).
A. C. Newman (London, W.).
F. W. Nicholson (Liverpool).
W. Noble (Barnsley).
J. H. Odom (Sheffield).
R.W. Parker (Gateshead).
F. H. Pentelow (Manchester).
H. A. Petch (Scarborough).
A. R. D. Pictor (Bruton).
H. Pollitt (Manchester).
E. W. Prance (Plymouth).
P. A. Punter (Bridgend).
R. A. Richmond (Redhill).
O. M. Roberts (Carnarvon).
N. S. Robinson (Bedford).
C. E. F. Roe (London, E.).
C. W. Rogers (London, S.W.).
A. Rome (Liverpool).
W. E. Rothwell (Swinton).
L. Rowell (Newton Abbot).
C. Rowntree (London, W.).
J. W. Rudd (Manchester).
H. Sawyer (Kenley).
L. P. Sedgwick, Chiswick).
W. L. Semple (Newcastle-on-Tyne).
F. Shepherd (Bridgwater).
E. R. Silver (Twickenham).
I. L. Simpson (Blackburn).
H. G. Smith (Monkseaton).
T. H. Smith (Bolton).
A. R. Sortwell (London, W.).
G. W. Spurlock (London, E.C.).
G. P. Stainsby (Stockton-on-Tees).
C. E. Steel (London, W.).
F. J. Stevens (London, E.).
R. C. Stevenson (London, S.W.).
W. R. Stransom (Reading).
F. Sutcliffe (Colwyn Bay).
P. E. Sweatman (Gerrard's Cross).
W. E. W. Terrell (Kendal).
J. C. P. Toothill (Sheffield).
H. F. Trew (Gloucester).
C. A. Walker (Preston).
T. J. Waller (Durham).
F. Warwick (London, N.W.).
G. Waterhouse (Kendal).
D. H. Webber (Birmingham).
C. W. West (Ashford).
L. E. Williams (Purley).
A. J. Wood (Leicester).
P. A. Woolams (Walsall).
R. Woolley (Wembley).
C. Wright (London, W.).
J. A. Wright (Bushey Heath).

Intermediate Examination.

The Intermediate Examination, qualifying for registraton as Student R.I.B.A., was held in London and at the undermentioned provincial centres on June 15th, 16th, 18th, and 19th; 126 candidates were examined, with the following results:—

District	Number Examined	Passed	Relegated
London	105	47	58
Bristol	15	9	6
Glasgow	4	3	1
Leeds	14	7	7
Manchester	22	8	14
Newcastle	16	9	7
	176	83	93

The successful candidates are as follows, being given in order of merit, as placed by the Board of Examiners:

H. S. Besant (London, N.).
D. W. Day (Leicester).
H. Cherrington (Tipton).
W. Milburn, jun. (Sunderland).
T. A. Swan (Edinburgh).
N. B. Robertson (Leicester).
F. E. Howard (Oxford).
J. Page (London, S.W.).
F. R. Cooper (Leicester).
C. D. Carus-Wilson (Sevenoaks).
L. H. Bucknell (London, N.W.).
G. Vey (London, W.).
A. Lakeman (London, N.W.).
S. G. Livock (London, N.).
C. M. Swannell (London, N.).
F. Dowdeswell (London, N.).
D. Harvey (Hull).
R. Stokoe (Sunderland).
N. Wigzell (Sunderland).
A. Booth (Barnsley).
R. Cromie (London, (S.W.).
S. Riches (London, S.W.).
T. C. Howitt (London, W.C.).
E. J. Sutcliffe (Hebden Bridge).
H. R. Martin (London, S.E.).
W. V. Coates (Grimsby).
J. A. Parker (Colne).
F. Suddards (Bradford).
G. Stanley (Trowbridge).
S. Grabham (Sunderland).
S. P. Schooling (Enfield).
J. R. Maugham (Newcastle-on-Tyne).
E. W. Gisby (Stafford).
P. O. Platts (Wakefield).
W. A. Orton (London, S.E.).
J. Moodie (Goodmayes).
H. Goldstraw (Hanley).
P. N. Logan (Bristol).
O. F. Davidson (Newcastle-on-Tyne).
E. Roughley (St. Helen's).
W. C. Watson (West Hartlepool).
T. B. Bansor (Fen Ditton).
R. A. Barker (Wimbledon).
H. J. Benians (Gouldhurst).
W. Beswick (Chester).
A. C. Blackmore (Cottingham).
H. J. Blenkinsopp (Sheffield).
H. E. Bunce (London, N.E.).
W. H. Burgum (Birmingham).
C. F. Butt (London, W.).
C. H. Calvert (Nottingham).
W. D. Cathcart (London, W.).
K. A. Cockrill (Great Yarmouth).
C. Cooke (Westcliff-on-Sea).
G. A. Cope (London, W.C.).
L. A. Culliford (Acton).
A. M. Durrant (Hemel Hempstead).
B. A. Dyer (Hereford).
G. S. Ford (Nottingham).
J. G. Gibbons (Birmingham).
T. C. E. Green (London, W.).
C. O. Gruffydd (Wellingborough).
H. W. Hall (Liverpool).
H. Harper (Birmingham).
J. C. Harvey (Northampton).
M. M. C. Jones (Glasgow).
P. C. Jones (Leicester).
G. F. Jotham (Cardiff).
M. Leybourne (South Shields).
L. S. Littlejohn (Eccles).
W. Lucas (London, W.).
F. W. Marshall (Solihull).
F. N. D. Masters (Doncaster).
E. E. Morgan (London, N.).
W. H. Pearson (Reading).
V. H. Peart (Gorleston-on-Sea).
E. J. Polglase (Bristol).
T. A. Skinner (Bristol).
F. W. Smith (Newark-on-Trent).
W. B. Stedman (Margate).
A. G. Taylor (Kingston-on-Thames).
L. T. Weaser (Southend-on-Sea).
W. E. Willis (Ystrad).

Exemptions from the Intermediate Examination.

The following candidates who had attended the architectural courses and obtained first-class certificates at the Universities mentioned against their names, were granted exemption from sitting for the Intermediate Examination, and have been registered as Students R.I.B.A.:—

A. F. Evans (Prescot). (School of Architecture, Liverpool University).
E. G. Newnum (London, N.W.). (School of Architecture, University College, London).
H. P. Smith (Birmingham). (School of Architecture, University College, London).
H. G. Taylor (London, S.W.). (School of Architecture, Liverpool University).
C. Wright (London, W.). (School of Architecture, Liverpool University).

The Final and Special Examination.

The final and special examination, qualifying for candidature as Associate R.I.B.A., was held in London from June 25th to July 3rd. Of the 116 candidates examined, 36 passed, and the remaining 80 were relegated to the studies. The names and addresses of the successful candidates are as follows:—

W. Baird (London, S.W.).
C. G. Boutcher (London, S.E.).
F. H. Bromhead (Baldock).
S. Burgoine (London, S.E.).
A. C. Burlingham (Evesham).
J. S. Cable (London, S.W.).
C. W. Clark (London, S.W.).
W. B. Colthurst (Taunton).
A. Crampton (Southport).
D. W. Ditchburn (Leytonstone).
R. A. Dixon (Birmingham).
D. Y. Dyke (Bristol).
H. V. M. Emerson (London, S.W.).
W. M. Epps (Bexley Heath).
G. R. Farrow (London, S.W.).
C. Forsyth (Glasgow).
J. Grieve (Bradford).
H. J. Gravenor (London, S.E.).
E. R. Green (London, N.W.).
H. G. Holt (London, E.C.).
H. G. Jeffries (London S.W.).
J. McN. Jeffrey (London W.C.).
F. W. Langman (London, W.).
E. Loveluck (Bridgend).
F. Meakin (London, S.E.).
D. Milne (London, W.C.).
W. H. Mitchell (Sale).
F. J. Osborne (Birmingham).
J. T. Penfold (London W.).
R. A. H. Phipp (Manchester).
J. H. Sayner (London N.W.).
J. M. Scott (London S.W.).
A. Smithers (London S.E.).
A. W. Stelfox (Belfast).
S. P. Taylor (Letchworth
J. R. Truelove (London S.W.).

The Failures.

The following table shows the number of failures among the eighty relegated candidates in each division of the Final Examination:—

I. Design	52
II. Mouldings and Ornaments	68
III. Building Materials	27
IV. Principles of Hygiene	25
V. Specifications	54
VI. Construction, Foundations, etc.	40
VII. Construction, iron and steel, etc.	20

Colonial Examination.

The following candidate passed the Colonial Examination held in Johannesburg last year:—

E. H. Woodcock (Cradock, Cape Colony).

ALTERATIONS IN EXAMINATIONS.

The Intermediate.

The following subjects will be omitted from this Examination in future:—

1. Classic Ornament.

2. The characteristic mouldings and ornaments of each period of English architecture from A.D. 1000 to 1550, with their application.

3. The Orders of Greek and Roman architecture: their origin, development and application.

4. Outlines of the history of Mediæval and Renaissance architecture in Europe.

Instead of the above, two papers will be set on (1) the General History of Architecture; and (2) the Purpose of Architectural Features in Relation to the Buildings in which they occur.

Answers to be accompanied by explanatory sketches.

The Final and Special.

The following subjects will be omitted from this examination in future:—

Subject II.—The principal styles of architecture: their features, mouldings, and ornament. (i) The characteristic mouldings, etc., of the special style selected by the student; (ii) The characteristic mouldings, etc., of the principal styles of architecture.

Instead of the above the following papers will be set:—

Morning.—The Principles of Architecture: their Theory and Application. Illustrated by drawings.

Afternoon.—A written thesis. Illustrated by sketches.

The first Examinations under these new conditions will be held in June 1909.

The above changes are the outcome of the deliberations of a Joint Committee of the Board of Examiners and the Board of Architectural Education, and their object, as stated in the recent annual report of the latter body, is to simplify the examinations and bring them into line with the Board's syllabus of training published in the "Kalendar." It had been felt for some time that the headings of the subjects on the Art side of the examinations were too precise, and rather tended to foster cramming, which the Board of Examiners are anxious to avoid. The examiners have felt themselves precluded from going beyond the exact limits of the headings of the subjects, and the candidates have been handicapped by the narrow scope of the questions. It it not intended to make the examinations harder; but the desire of the Board of Architectural Education and the Board of Examiners is to give the candidates fuller opportunities of showing their knowledge and the results of their study than has hitherto been possible.

THE ARTIFICIAL LIGHTING OF THE ROMAN HOUSE.

The palatial luxury of many of the innumerable villas with which Italy was once crowded may be fairly well pictured in imagination from the incidental allusions to these structures which appear in the works of the ancient poets, and from the special descriptions of the domestic architecture of the period contained in the writings of the historians of ancient Rome. Indeed, the old literature of the Eternal City affords sufficient indication of the architectural magnificence of the stately home of a Roman patrician to dazzle and astonish the present more prosaic and utilitarian age. But, enshrined as they were, amidst charming surroundings, of which statuary, paintings, mosaics and fountains formed a very customary part, the living-rooms of a Roman villa could have been, on occasions, anything but comfortable, owing not only to the inadequate arrangements provided for the diffusion of artificial light, but to the fact that no means was then known of preventing the smoking of the lamps which formed the illuminating medium.

In the earliest times the rooms were lighted by means of pans filled with chips of resinous wood tied together with bands of bast, but afterwards light was supplied by torches, the cases of which, formed of metal or clay, were filled with resinous substances. Dry wicks of linen, or oakum, dipped in wax or tallow, were also much used for artificial lighting in the early days of Roman civilisation.

The invention of oil-lamps caused a revolution in the hitherto accepted methods of lighting, and soon after their general introduction they began to be constructed and ornamented in an almost endless variety of ways. The lamp consisted of two parts (1) a saucer, or receptacle for the oil—round, oval, or angular in shape—which was often covered with a lid having a perforation for pouring in the oil, and (2) the wick holder, or rostrum, which took the form of a projecting socket. Sometimes a second hole was pierced in the surface of the oil vessel through which the wick could be pushed by means of a needle. Portable lamps were constructed with handles, and those that were intended to be suspended were provided with two or more ears to which light chains could be attached. Lamps made to contain any number of wicks from one to twenty were thus either hung from the roof or set upon a lofty stand.

At first made only of clay, the generality of their use caused the manufacture of lamps to become an important feature of the Italian pottery trade, but afterwards lamps of bronze and other metals, alabaster, and, still later, of glass, became common.

Decoration of Roman Lamps.

Many of the Roman lamps were profusely decorated on their surfaces and handles with ornamental reliefs and modellings of varied character, and were veritable works of art, bronze lamps in particular being especially distinguished by the artistic nature of their design. Suitable implements, often fastened by a chain to the lamp handle, were provided for trimming the wick, and small vials for filling the lamp with oil were sometimes also attached to the lamp itself.

The word *candelabrum* was originally applied to a lamp furnished with a metal point, on which a taper *candela* was fixed; but after the use of lamps had become general, the term was used to designate the wooden or metal support composed of a base, a tall thin shaft and a disc, on which the lamp was placed. Sometimes the *candelabrum* was fitted with a simple apparatus for raising or lowering the lamp, in which case its shaft was hollowed and fitted with a movable rod supporting the arms or disc, which could be fixed, by means of bolts, at any requisite height.

Like the lamps themselves, the *candelabra* were made in diverse shapes and ornamented in a number of different ways, and many of the designs were of extraordinary grace and beauty. In addition to the small portable ones in general use in Roman houses, which were usually either set on a stand or placed upon the floor, many of the temples and palaces were adorned with massively constructed *candelabra* which, shaped like columns and profusely enriched, were placed upon elaborately-decorated pedestals.

The *lampadarium* (lamp-bearer) was merely another form of the *candelabrum*. It had no disc, but it was provided with arms or branches corresponding with the number of lamps it was intended to carry. Until the introduction of glass, lanterns made of transparent material, such as oiled linen, talc and horn, were in very general use.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters

Studentships and Prizes.

ALPHA (Wilts) writes: "Where can I obtain particulars of prizes and studentships for 1908 of the Royal Academy, the Architectural Association, and the Society of Architects?"

Apply to the secretaries of the societies in question at the following addresses:—Royal Academy, Burlington House, Piccadilly, W.; Architectural Association, 18, Tufton Street, Westminster; Society of Architects, Staple Inn Buildings, Holborn.

Openings for Architectural Practice.

MERIDIAN writes:—"Can you give me any idea of the districts in which building of any extent is going on, and what prospect there is of work (architectural) being available?"

It is quite impossible to give any definite reply to your enquiry. The building trade is very much depressed everywhere, though naturally more is going on in the big centres than elsewhere; but as regards participating as an architect in what work is projected or in progress, that must necessarily be an individual matter for yourself, and dependent on your own ability, resources, and influence.

Attaching Slates to Steel Purlins.

MOTHERWELL.—A. B. writes: "I should be glad to know how to attach slates directly to steel purlins, and other forms of steel framing."

You will see an illustration of this on p 84 of our issue for last week which will probably give you the details you require.

Renovation and Preservation of Stonework

LONDON.—E. G. S. writes: "Can you tell me the best method of renovating decayed stonework where it is necessary to retain as much of the old work as possible: also, what is the best silicate solution to use to prevent further decay?"

The best treatment for decayed stonework is with baryta-water, as used by Professor Church on the Chapter-house of Westminster Abbey. You will find details of it on p. 246 of our issue for May 3rd, 1905, and in our issues for February 3rd and 17th, 1904. There are also several patent preservative fluids on the market.

WALKER COTTAGE EXHIBITION AWARDS.

The awards in the North of England Cottage Exhibition at Walker, Newcastle-on-Tyne are as follows:—

Class A.—Cottages costing £195. Gold medal, Nos. 71 and 72: Architect, A. T. Martindale; builder, T. V. Martindale. Silver medal, Nos. 3 and 4: Architect, E. Cratney; builder, Jas. McHarg. Bronze medal, Nos. 1 and 2: Architect, Jos. Potts and Sons; builder, W. D. Allison.

Class B.—Cottages costing £235. Gold medal, Nos. 79 and 80: Architects, White and Stephenson; builder, T. Clements. Silver medal, Nos. 7 and 8: Architect, E. Cratney; builder, Jas. McHarg. Bronze medal, Nos. 57 and 58: Architect, C. A. Clayton-Greene; builders, J. W. Braithwaite and Co.

Class C.—Cottages costing £260. Gold medal, Nos. 25 and 26: Architect, E. Cratney; builder, Jas. McHarg. Silver

medal, Nos. 39 and 40: Architects, Barnes and Burton; builder, E. M. Tweddle. Bronze medal, Nos. 23 and 24: Architect, E. Cratney; builder, Jas. McHarg.

Class D.—Cottages costing £350. Gold medal, Nos. 45 and 46: Architects, T. E. Davidson and Son; builders, J. W. Braithwaite and Co. Silver medal, Nos. 47 and 48: Architect, E. Cratney; builder, Jas McHarg. Bronze medal, Nos. 35 and 36: Architect, Karl B. Spurgin; builder, John Milne.

All the cottages are built in pairs and the prices stated above include the architects' fees.

Notes and News.

A MEMORIAL TABLET TO GENERAL WOLFE has been placed on the house in Bath—No. 5, Trim Street—where the great soldier once lived.

* * *

A COLONY OF ARTISANS' DWELLINGS is to be established on Garden City lines by the Corporation of Bury, the houses to be let at rentals varying from 3s. 6d. to 5s. 6d. per week.

* * *

THE A.A EXCURSION.—This year the annual excursion of the Architectural Association will take place in Holland, with Bruges as the centre. The party leaves on Saturday next, August 8th, and returns on August 15th.

* * *

LONDON COUNTY HALL.—The large water-colour perspective of the revised design for the London County Hall which we reproduced in our issue for July 22nd is by Mr. Harold Wyllie, not Mr. C. W. Wyllie, as stated.

* * *

THE ART GALLERIES AT THE WHITWORTH INSTITUTE, Manchester, were formally opened on Wednesday last by Sir Charles Holroyd, Director of the National Gallery. The architects of the new buildings, which have cost £50,000, are Messrs. Beaumont and Son.

* * *

MESSRS. RICHARD CRITTALL AND CO. have secured the contract for the heating, ventilating and hot-water services at the Cavalry Club, under the supervision of the architects, Messrs. Mewès and Davis. As this is an extension and alteration to existing buildings, the "Cable" system of heating is being utilised as the most adaptable.

* * *

MESSRS. H. H. MARTYN AND CO., LTD., the well-known firm of architectural sculptors and carvers, have just moved into new and extensive premises known as "Sunningend," Lansdown, Cheltenham. These new works are in direct communication with the main railway lines, and, standing as they do on some five acres of land, will enable the company to bring their various branches together, and afford them splendid facilities for dealing with their rapidly developing business.

Our Plate.

Palazzo Nobili, Montepulciano, Italy.

This palace by Antonio da Sangallo the Elder is built of a warm brown stone and roofed with the usual red tiles. Its position in the corner of the Piazza Vittoria Emanuele, which is surrounded by the cathedral, the town hall, and several sumptuous mansions, makes the reasonableness of the open loggias quite evident.

Notes on Competitions.

Extensions to St. Chad's Church, Leeds.

In a limited competition for chancel and extensions to St. Chad's Church, Leeds, the design submitted by Mr. J. Harold Gibbons, F.R.I.B.A., of Manchester, has been selected by the assessor (Mr. H. C. Corlette, F.R.I.B.A.), and approved by the committee.

New Schools at Tiverton.

No fewer than 231 designs were submitted in this competition. The awards are as follows:—1st, Mr. W. H. Ashford, A.R.I.B.A., Birmingham; 2nd. Mr. W. H. Ansell, A.R.I.B.A., London, W.C. These two designs will be on exhibition at the School of Art, Tiverton, from September 21st to 28th. Mr. C. Harrison Townsend, F.R.I.B.A., was the assessor.

New Schools in the Birmingham District.

In the competition for a new infants' school at Cotteridge the design by Mr. J. P. Osborne, of Birmingham, has been accepted, and that by Messrs. Ewen Harper and Brother, of Birmingham, for new schools in Grove Road, King's Heath. Mr. J. L. Ball, F.R.I.B.A., has been appointed assessor in the competition for a new infants' school at Stirchley Street, and Mr. A. N. Bromley, F.R.I.B.A., in the competition for new schools in Pershore Road.

Competitions for Students and Apprentices

We have received from the promoters of the Midland Counties Building Trades' Exhibition (to be held at Bingley Hall, Birmingham, from October 12th to 21st) a copy of the particulars issued in connection with the competitions for students and apprentices which are being held in connection with the Exhibition. The competitions are divided into two classes, namely, (A) work done prior to the opening of the Exhibition, and (B) work to be done at the Exhibition. Class A includes the following subjects:—Design for Workmen's Cottages, Design of Ornamental Enriched Plaster Ceiling, Wall Decoration, and Ornamental Metalwork; while Class B comprises: A Gauged Brick Arch, Plumbing (various joints), Plumbing (working of sheet lead to competitor's model), Queen-post Roof Truss, Clay Modelling (a panel), Masonry (plan and model of groin springer). The prizes offered range from £1 to six guineas.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Aug. 7	SECONDARY SCHOOL AND TECHNICAL INSTITUTE AT CLECKHEATON (150 places).—Premiums £50, £30, and £20. Particulars from J. H. Linfield, Clerk, Town Hall, Cleckheaton.
Aug. 31	PARISH CHURCH AT BISHOPSWEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Road, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Oct. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
No date.	SITE-PLAN FOR COTTAGE EXHIBITION, SWANSEA, 1909. Gold, silver, and bronze medals, together with sums of £20, £15, and £10. Particulars from Henry R. Aldridge, Secretary to Exhibition, 7, Gower Street, Swansea.

ELECTRICITY IN BUILDING IV.

By Harold Hastings, M.I.E.E., A.M.Inst.C.

(Continued from page 87, No. 703).

Jointing Cables.

The end of a cable is prepared f jointing by cutting away the insulati and bareing a short length of the co ductor. The amount of conductor bar should be approximately 1in. with single wire, 2ins. with a stranded co ductor of two layers of wires (such as 7/16s), 3ins. with a conductor of thr layers, and so on. The vulcanised rubb should be stripped of braid and tapes about 1in. In cutting away any part the covering the knife should always used in a slanting direction with the bla cutting towards the end of the cable. doing it in this way the dielectric is l likely to be cut when removing t mechanical protection, and the copp less likely to be nicked when cutti away the rubber.

The strands should be cleaned with f emery-cloth, but not enough to remo the tinning. The wires are spliced gether as shown in the sketches. In case of a single wire they are mer twisted. The seven strand has centre wire removed, the 19 strand l the centre wire removed on one side a the six wires of the second layer remov on the other, for half the length expos A 37 strand is more complicated, as has the 7 centre strands removed for h the exposed distance on one side, and third layer, consisting of 12 wires, moved an equal distance on the other si The wires are spliced as shown in e case, and the extremities of the joint soldered, but not the middle part.

When the joint has cooled after be soldered, any sharp points of solder m be removed, and burnt or scorched rub cut away. It is then taped over w pure rubber tape, each turn covering h the former turn, and each layer being w smeared with india-rubber solution.

A cotton tape which has been satura with preservative compound is applied the final mechanical protection.

A well-made joint when comple should not exceed one and a half tir the diameter of the cable (Fig. 29).

Tee-joints are made in exactly same way except as regards the metl of splicing. A single wire is sim twisted (see Figs. 30 and 31). A stranc wire has all its inner strands removed a

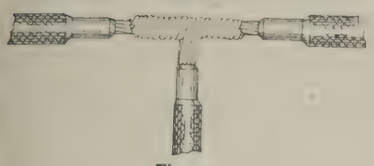

Fig. 31.

those of the outer layer are divided into two equal parts, which are twisted on to the main conductor in opposite directions. The main conductor never has any of its strands cut. In no case should soldering be omitted.

Casing and Tubing.

As rubber insulated wires and cables are not mechanically strong enough to be exposed in buildings without further protection, and are generally considered somewhat unsightly, it is necessary to adopt a suitable means of covering them throughout their length.

The channel must be decorative where exposed to view, and strong everywhere. The two classes chiefly employed are metal tubing and wood casing. Both have advantages and disadvantages and must be selected according to the nature of the proposed work.

Tubing.

The material used for metal tubes is sheet steel, and the qualities vary according to the way in which it is formed into a conduit. The simplest form is made by cutting the sheet of steel to the required width and bending it into the form of a tube, leaving the cut edges butting together and not joined in any way. It is coated with enamel and the various lengths are jointed together by being pressed into sockets. This class of tubing is only suitable where the situation is quite dry, and even then it cannot be highly recommended.

A slightly superior tube is made in which the joint is brazed, and a still better where it is welded.

The chief objection to this form of tube is not in the longitudinal joint, but in the method of joining the lengths together. It is not a good mechanical job to simply push a tube into a socket and take no other means of securing it. It is also important to maintain electrical continuity throughout the system of tubing, as will be explained later. In order to meet these objections a heavier kind of tube has been introduced which has a brazed or welded longitudinal joint and which is thick enough to take a gas thread. With this class the lengths are joined by screwing them into sockets in the same way as with gas piping. If the screwed threads are clean and tight-fitting the electrical continuity will probably be sufficiently good.

For the very best work a solid drawn steel tube is made, and, with this, the lengths are screwed together. It is seldom necessary to use this class of tube, as the heavy tube with a brazed joint is quite good enough for its purpose. Therefore, anything stronger is a luxury.

Ordinary gas piping should never be used, as its interior surface is far too rough and will damage the wires.

There is little to be gained by using a conduit having its interior surface covered with an insulating material, though there are many such upon the market. If extra insulation is required it should be added to the wires rather than to the conduit. The insulated conduits are always expensive, and there is a difficulty in maintaining the insulation where the lengths are joined together.

These remarks do not apply to enamel, of which a thick coating should cover both the inside and outside surface. The object of the enamel is to prevent rusting, not to insulate.

"Earthing."

It has been mentioned above that it is important to maintain electrical continuity throughout a system of conduits. The reason for this should be thoroughly understood. The tubes also need to be efficiently connected with "earth" at one or more points. One of the best "earths" obtainable is the water service pipe, the connection being made by twisting a bare copper wire round the pipe and sweating it. The wire is then taken, without a joint, to the nearest tube, twisted, and sweated to that, the enamel being removed for the purpose, and afterwards replaced.

Suppose that, in a certain case, the tubes were not connected with "earth," and that one of the wires inside a tube became damaged and made good electrical contact with the tube. There would be no flow of current through this fault because there would be no complete circuit. But at supply stations it is usual to "earth" one pole. Thus the tube under consideration might be "alive" on the pole opposite to the one earthed at the station, in which case anyone touching any part of the system of tubing would receive a very unpleasant shock.

Again, in the case of an installation which is improperly "bonded"—that is, which has not electrical continuity throughout—one such fault might occur at one point and a similar fault on the opposite pole at another point. One set of tubes would be alive with one pole and the other set with the other pole. At some point the two sets of tubes might be almost touching. A slight accumulation of damp or dust might start a flow of current. A spark would be formed, an arc started, and the house would soon be in flames.

By proper bonding and earthing these dangers can be entirely avoided.

For unscrewed tubing a nipple has recently been introduced for bonding the lengths together. It apparently gets over the electrical difficulty, and goes a long way towards solving the mechanical objection.

Fittings for Tubing System.

The various fittings for a tubing system are bends of different angles, sleeves, elbows, tees, inspection boxes, etc., all of which can be obtained either in one piece or split through the centre line for placing round the tube after it is in position. There are also bases forming suitable mounts for the various fittings.

Junction boxes can be obtained up to any reasonable number of ways.

The methods of placing the wires in the tubes are two. The tubes can be threaded on to the wires, or the wires can be drawn into the tubes. If the threading-on method is employed care must be taken when screwing the tubes together to see that the wires are not damaged by twisting.

In the drawing-in system the chief danger lies in abrasions from drawing the wires over rough places and round too sudden bends. It is advisable to have plenty of inspection and junction boxes, so that only a short length need be drawn in at a time.

The practice of crowding as many wires as possible into one tube is bad. It is best to have only two wires in each—viz., the lead and return of a circuit. If the wires of several circuits are in the same pipe, a fault upon any one will affect them all.

Installation of Tubes.

When placing the tubes in position in new buildings the work should be commenced before the plasterers begin, and before the floors are put down. In large buildings a casement should be provided from bottom to top, and provision left for tappings at each floor. Where tubes of any size run over walls they should be recessed into the brickwork. This is unnecessary where they are of small diameter, say up to ½in., as the thickness of plaster will more than cover them. They are held in position by pipe-hooks on brickwork, and by saddle-pieces on woodwork. The main run of pipes in a casement should be supported at frequent intervals, say, every 3ft., by saddle-pieces screwed into wood plugs. Clips are obtainable having a screw-hole on one side only. These should not be used for long vertical runs, as they cannot properly grip the pipes.

Under floors the tubes can be let into the joists, and slack wires are left coiled up just above the position in which the fitting will be placed.

As metal tubes are given to "sweating"—that is, the interior surface becomes coated with moisture with every fall of temperature—it is necessary to provide cables of a somewhat superior class. It is also advisable to arrange the tubes with a definite fall and to have an opening at the lowest and highest points. Any moisture which may collect will run out at the lowest points. They should be chosen in such places that a few drops now and then will not be harmful to any of the surrounding decorations. Such places are the spaces between the floors and ceilings of a house. By providing holes, as described, the effects of condensation are very much lessened, since the air can circulate inside the tubes, entering at the lowest apertures and coming out at the highest.

Best Tubes to Use.

To summarise our remarks upon tubes, the best class to use, when considered in conjunction with cost, is the heavy pipe with a brazed longitudinal joint and screwed together. The next best is the light butt-jointed tube used in conjunction with an earthing nipple. Either kind should be enamelled inside and out. Electrical continuity must be maintained throughout the system, and one or more good earth connections made. The wires of each circuit should have a separate tube to themselves. Junction and inspection boxes should be generously distributed. Wires of good quality should be used. Ventilation and drip holes should be provided.

The size of tubing required can be easily determined by obtaining the overall diameter of the wires which have to be drawn in from the wiring-table already given. By drawing small circles to scale, and a larger circle around them, the smallest diameter into which they can

TABLE D.

	External Diameter.	⅜	½	⅝	¾	⅞	1	1¼	1½	2
Internal Diameter	Light Gauge	.30	.43	.54	.66	.77	.90	1.13	1.38	1.87
	Heavy Gauge Brazed and Screwed	—	.40	.50	.63	—	.88	1.06	1.31	1.81
	Heavy Gauge Welded and Screwed	—	.38	.44	.58	—	.83	1.03	1.36	1.73

possibly be drawn is obtained. The size of tube nearest about this size is the one into which the wires can be threaded, while one size larger should be used if they are to be drawn in. The internal diameters can be taken as in Table D.

Casing.

Wood casing has had a longer reign than metal tubes, and, even now, can at least be said to share popularity equally. The usual quality is made of American whitewood, and has a great deal to be said in its favour.

Casing is supplied in lengths of about 12ft., and is made in various sizes to suit different sizes of conductors.

It is a plain lath of wood having two grooves to take the wires, U-shaped and as deep as they are wide.

The following table will show the standard dimensions for each size:—

TABLE E.

Size of wire S.W.G.	Total width of casing.	Width and depth of grooves.	Distance between grooves.
1/16	1⅜	3/16 = .188"	⅜
1/18 to 2/18	1½	¼ = .25	½
2/16 to 1/8	1⅝	5/16 = .313	⅝
1/8 to 1/7	2¼	⅜ = .375	¾
1/16 to 1/7	2½	½ = .500	1
1/6 to 3/17	3	⅝ = .625	1
1/8 to 3/16	3½	¾ = .750	1⅛
1/12 to 3/17	4	⅜ = .375	1½
1/2 to 1/12	4½	1 = 1.000	1½

This table is prepared for use with the wire scheduled in Table C (see BUILDERS' JOURNAL, July 22nd). If lower grade wires are used the size of casing can be easily determined by comparing column 3 in decimals with the new overall diameters.

Casing is always provided with an equal length of "capping," as the ornamental cover is called. In the smaller sizes up to 2½ins. in width, the capping is screwed on with brass screws in the centre. In larger sizes the screws are placed in the sides.

Wood casing maintains its popularity in spite of all competition, because it is so easy to cut and fix; it enables the wires to be kept apart; in dry situations it increases the insulation resistance; and the wires are not subject to severe handling when being placed in position. The value of the insulation resistance of dry casing may be taken as 30 megohms per mile, so that this consideration, in conjunction with the fact that the wires are not handled excessively, makes it possible to use a lower grade of wire than would be used with tubing.

It is quite good practice to use taped wires, instead of taped and braided, up to the size of 7/20½, and considerable saving can be effected thereby. The overall diameters are reduced and, therefore, smaller casing can be used. The amount of the reduction is .45 of an inch, so that if the diameters given in table C (see BUILDERS' JOURNAL, July 22nd, p. 74) are reduced by .045, it will be seen that the smaller sizes of casing have a much greater range of utility. Sizes from 7/20 upwards are invariably braided.

In close-cut work 300 megohm grade may be used if it is carefully handled, but it cannot be strongly recommended. The alteration of grade does not affect the overall diameter, as the same thickness of rubber compounds is applied, but a poorer quality.

The mechanical protection offered by wood is poor when compared with steel tubes, but this is not of so much importance where the casing is exposed to view. Casing cannot be recommended for damp or steamy situations, but even here a fairly good job can be made with it by giving it two coats of shellac varnish, or boiling it in Stockholm tar. In such places it should also be blocked away from the wall to the extent of two or three inches.

Fixing Wood Casing.

In buildings which are in the course of erection casing may be run in the same way as recommended for tubes. It is usually nailed on walls in such a way that the plasterers will ultimately arrive at the same level as the casing with capping removed. Some prefer to put the capping in position and let the plaster be made level with its outer surface. In no case should casing be entirely buried under the plaster as there is great danger that nails may be unwittingly driven into it. It must always be placed vertically or horizontally, otherwise it will present an ugly appearance when the work is complete. All joints in the capping must make a true fit, and corners carefully mitred. Under floors it should be so placed that the capping will not press against the underside of the boards. Measurements must also be taken to assure that the boards will cover it centrally, or there will be a danger of floor-brads piercing it. Boards above a run of casing are best screwed down so that they may serve as an indication that wires are underneath. On account of these considerations some contractors prefer to fix their casing after the floors have been laid down, even though this entails the extra labour of relifting them.

In wiring old buildings casing is very adaptable. It is not deemed unsightly on walls or ceilings where installed with taste. It should never end abruptly, but a decorative scheme should be considered, even though it involves erecting casing and capping which is never destined to contain wires. For instance, a ceiling from which it is proposed to suspend four lights spaced at equal distances from each of the corners, should have the casing crossing and recrossing it so that it is divided into panels. This, of course, only applies where it is not possible to put the casing out of sight above the ceiling.

When bringing the casing down a wall to a bracket or a switch, it is frequently possible to make a very neat job by cutting a chase just wide and deep enough to take the casing, and to use a wider capping to hide the jagged edges of the plaster.

It is rarely necessary to plug the wall, as suitable fixing can be obtained by driving floor-brads at different angles.

In taking switch or bracket wires down a lath and plaster partition, they can be placed in their casing and the capping screwed on. This combination can then be lowered from above and secured by screws to a joist. A hole of small dimensions is sufficient to bring the wires through to the fitting and they can easily be fished out with a hooked piece of stiff wire.

Brass screws should be used for fixing the capping, and they should be round-headed for all work. Screws must never be Manchestered into position, as they will probably bend and damage the wire. The use of nails is forbidden by all the rules of insurance companies and other authorities.

Wires should not be "bunched" in casing, but each groove should contain one wire and no more.

To summarise our remarks, casing is not suitable for running under plaster; it is not mechanically as strong as tubing, but it is easier to handle, makes a better electrical job, enables the use of a lower grade of wire, and is much more adaptable for installing wires in old buildings and surface work generally.

"ARCHITECTURE & JOURNALISM."

This is the title of a booklet, beautifully printed and illustrated, giving an interesting account of the publications issued by this Company.

This booklet contains a suggestion, and sets out an arrangement showing how Architects and others can utilize any particular points of interest that they come across in their practice, and thus not only add to their own incomes, but add to the value and practical interest of our papers.

Bankruptcies.

During the week ended July 24th sixteen failures in the building and timber trades in England and Wales were gazetted.

T. SMART, painter and decorator, St. Helens R.O., July 20.

A. DUNN builder, Gloucester. Gross liabilities £15,233; assets estimated to give a surplus of £3,768.

H. J. HARDING, builder, Bideford. Gross liabilities £799; £249 expected to rank for dividend deficiency £228.

RINDAL and WINCOTT, builders, Ashby, near Doncaster. First meeting, O.R.'s, Sheffield, Aug. 6 at 11.30. P.E., C.C., Sheffield, same day, at 2.

W. L. GRIFFITHS, architect, London, W.C. R.O., July 24. First meeting, Bankruptcy Court, Aug. 7, at 12. P.E., same, Sept. 15, at 11.

F. BRITTON, builder and contractor, London, W.C. Unsecured liabilities estimated at about £9,000. Adjourned meeting of creditors, Aug. 17.

G. B. ANDREWS, builder, Ivybridge. Gross liabilities £3,288; £1,249 expected to rank for dividend; assets estimated at £481; deficiency £768.

S. WARBURTON, builder and contractor, Manchester. First meeting, O.R.'s, Manchester, Aug. 5, at 3. P.E., C.C., Manchester, Aug. 22, at 10.

E. BURGE and Co., builders, Sydenham. R.O. July 21. First meeting, 13, York Road, London, S.E., Aug. 7, at 2.30. P.E., C.C., Greenwich, Aug. 17, at 1.

H. C. FOULKES, builder, London, E.C. Liabilities estimated at £500,000. According to debtor's statement, he begun business as a builder 3 years ago with a capital of about £100, and during the last six years he had also acted as a director of gold mining and other companies. Three years ago he regarded himself as worth £100,000. He attributed his failure to depreciation in the value of his properties and to the loss of rents due to empty houses.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 6. SENGHENYDD.—Erection of a public hall (to seat 1,000), large gymnasium, etc., together with library and institute in Commercial Street, Senghenydd. Plans and specification may be seen at the office of W. Beddoe Rees, architect, 3, Dumfries Place, Cardiff, and bills of quantities obtained on a deposit of £3 3s. Tenders sealed and endorsed are to be delivered to S. G. Worman, secretary, 18, Coronation Terrace, Senghenydd, on or before August 6.

August 6. KINGSBRIDGE. — Erection of stands and fitting-up the showyard for the annual exhibition to be held on September 17, for the Kingsbridge Agricultural Society. Tenders may be submitted either on the basis of: (a) Contractor providing labour and all materials, the materials to remain his property; or (b) Contractor providing labour only, and materials to be provided by the society. Tenders are also invited for:—(c) 250 good larch hurdles, to be delivered on the show field. Particulars and conditions may be obtained on application to H. Vickery, secretary, Torcross, near Kingsbridge, to whom tenders must be delivered not later than August 6.

August 7. KENDAL.—Extensions to Stramongate Hall. Plans and specifications can be seen and bills of quantities obtained on application at the office of S. Shaw, F.R.I.B.A., architect, Kendal, till August 7, upon which day tenders are to be delivered to him.

August 7. BRECON.—Construction of new cells and for various alterations, re-building, etc., at the Defynnock Police Station, for the Standing Joint Committee of the County of Brecon. The plans and specification can be seen at the office of C. W. **Best, M.I.C.E.,** county surveyor for Breconshire, County Hall, Brecon, and bills of quantities obtained on deposit of £2 2s. Tenders must be delivered at the same place not later than 11 a.m., on August 7.

August 8. WARRINGTON.—Retiling a cottage roof at Appleton Reservoir and sundry fencing work, for the Water Committee. Tenders to be sent in not later than August 8. All further particulars may be had from J. Deas, A.M.I.C.E., water engineer, Municipal Offices, Warrington.

August 8. FLOOKBURGH.—Erection of additions to the Village Hall, Flookburgh. Bills of quantities may be obtained on application to H. T. Fowler, architect, 6, Cornwallis Street, Barrow-in-Furness; and the drawings may be seen at C. K. Wright's, Flookburgh. Tenders must be delivered to the architect on or before August 8.

August 8. LEEDSTOWN.—Erection of a new Sunday school, for the Building Committee, according to plans and specifications, which may be seen at T. Trevaskis's, Leedstown. Sealed tenders, and endorsed "Tenders for Leedstown New Sunday School," are to be sent to Rev. P. Gallier Copperhouse, Hayle, on or before August 8.

August 8. NANTYMOEL.—Erection of Congregational chapel, Nantymoel. Plans and specifications to be seen at the Rev. T. Hirwen Jenkins and with David Davies at 178, Habershon Street, Splott, Cardiff. Endorsed tenders to be delivered on or before August 8, to the Rev. T. Hirwen Jenkins, Nantymoel.

August 8. BALTINGLASS. — Contracting for the under-mentioned works, for the R.D.C., from August 8, 1908, namely:—(1) Sinking a well and erecting a pump at Clonmore National School; (2) Repairing cottage at Rathnafishogue, according to specifications. Sealed tenders to be posted so as to reach J. R. Dagg, clerk to the Council, at Baltinglass Workhouse, on or before 11 o'clock on August 8 in order to be considered at a meeting of the Council to be held at the Workhouse on that day, but no tender will be received or considered by the Council unless received on or before the hour above mentioned. Each contractor will be required to give security for double the amount of the contract. Forms of contract and bond may be seen, and all further particulars learned, on application to the clerk.

August 10. SPRINGWELL.—Extensions to the Wesleyan Sunday school at Springwell, near Gateshead. Builders desirous of tendering can inspect the pans and specifications at the office of J. W. Taylor, F.R.I.B.A., St. John Street, Newcastle. Sealed tenders, endorsed "Springwell Sunday Schools," are to be delivered to him not later than 10 o'clock on August 10.

August 11. BRIDGEND.—Erection of Nolton Church Institute, Bridgend. Plans and specification to be seen at the office of P. J. Thomas, architect and surveyor, Bridgend. Endorsed tenders to be sent to the Rev. E. S. Roberts, Rector of Coity, on or before August 11.

August 11. SALFORD.—Alterations to the Salford County Court, for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application at the Registrar's office at the County Court, between 10 a.m. and 4 p.m. (Saturday 10 to 1). Bills of quantities and forms of tender may be obtained at the undermentioned address on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on August 11, addressed to the Secretary, H.M. Office of Works, etc., Storey's Gate, London, S.W., and endorsed "Tender for Alterations, Salford County Court."

August 12. WORSBORO' BRIDGE.—Erection of a vicarage house, for the parish of St. James', Worsboro Bridge, near Barnsley. Plans may be seen at the offices of T. H. and F. Healey, architects, Tyrrell Street, Bradford, and duplicates at St. James's School, Worsboro' Bridge, until August 12, on which day tenders are to be delivered to the architects. Bills of quantities and other information may be obtained on application to the architects.

August 12. SHERBURN HILL.—Erection of boot and tailoring departments at the Shotton Colliery Branch Stores. Builders desirous of tendering for the whole of the works required can inspect the plans and specifications upon application to the Branch Manager at Shotton Colliery. Sealed tenders, endorsed "Shotton Stores," are to be delivered to T. Robson, secretary, Sherburn Hill Co-operative Society, near Durham, not later than 10 o'clock on August 12.

August 12. COWDENBEATH.—Erection of large new higher grade elementary, supplementary and mining school, Cowdenbeath. Estimates are invited for the various works, excavator, mason, and brick, carpenter and joiner, plumber, slater, plaster, tile, concrete, smith, glazier, asphalte, and painter works. Plans may be seen and specifications and schedules of quantities obtained from W. Birrell, architect, Kirkcaldy, on payment of £3 3s., for each trade. Estimates to be sealed and forwarded to J. Ross, LL.D., clerk to Beath School Board, Royal Bank Buildings, Dunfermline, marked outside "Tender, etc., Cowdenbeath School," not later than August 12, at 10 a.m.

August 13. BRISTOL.—Construction, and maintenance for twelve months after completion, of a timber-framed building, with concrete and brick foundations, for the Watch-House for H.M. Customs at the Royal Edward Dock, Avonmouth. Copies of the specification, schedule, form of tender, form of contract, and copy of the contract drawings can be obtained from W. W. Squire, engineer, Engineer's Office, Cumberland Road, Bristol, on production of a receipt showing that a deposit of £3 has been paid to the secretary of the Docks Committee, 19, Queen Square, Bristol. Tenders must be enclosed in a sealed envelope, endorsed "Tender for Watch-House for H.M. Customs," and addressed to the secretary of the Docks Committee, Docks Office, 19, Queen Square, Bristol, and must be delivered to him, accompanied by all the prescribed documents, before 10 a.m. on August 13.

August 14. TONYPANDY.—Erection of their new central premises, for the Committee of the Mid-Rhondda Co-operative Society, Ltd. Plans and bills of quantities prepared by the architects, the Co-operative Wholesale Society, Manchester, may be seen at the Society's premises in Gilmour Street, Tonypandy. Tenders to reach the Committee not later than August 14.

August 14. SHEFFIELD. — Alterations and additions at the Kiveton Park Provided School, near Sheffield. Plans may be seen and bills of quantities obtained on application to J. Vickers-Edwards, county architect, County Hall, Wakefield. A deposit of £1 is required. Cheques, etc., must be made payable to the West Riding treasurer, and sent to him direct at the County Hall, Wakefield, otherwise applications will not be entertained. Sealed tenders, properly endorsed, to be forwarded to the County Architect not later than 10.30 on the morning of August 14.

August 15. MERTHYR TYDFIL.—Erection of a Free Library at Perrott Street, Treharris. Plans and specification of the proposed building may be inspected, and a copy of the bills of quantities obtained from W. Dowdeswell, architect, Treharris, upon payment of a sum of £1 1s. Tenders, marked "Treharris Library," must reach T. A. Rees, town clerk, Town Hall, Merthyr Tydfil, not later than August 15.

August 15. PADDOCK WOOD.—Erection of a new Council school, to accommodate 200 boys, at Paddock Wood, Kent, for the Education Committee. Plans and specification, prepared by the Committee's architect, W. H. Robinson, M.S.A., and conditions of contract may be inspected at the offices of the Committee, between 10 a.m. and 4 p.m., until the time appointed for delivery of the tenders. Any person desiring to tender, and to receive copy of bills of quantities, must send in his name, accompanied by a deposit of £1, to F. W. Crook, secretary, Caxton House, Westminster, S.W., not later than noon on August 7. Tenders, on the form to be supplied with the bills of quantities, must be enclosed in a sealed envelope, endorsed "Paddock Wood Tender," and delivered to the School Correspondent, W. H. Tompsett, Barham House, Capel, Tonbridge, not later than noon on August 15.

August 17. DUTTON.—Erection of a porter's lodge at the Isolation Hospital, Dutton, for the Runcorn R.D.C. Specification and quantities may be obtained, and plans inspected (on a deposit of 10s. 6d. being made), at the offices of F. J. Jones, architect, Bank Chambers, High Street, Runcorn. Tenders, marked "Hospital Lodge," must be forwarded to G. F. Ashton, clerk to the Council, 71, High Street, Runcorn, on or before August 17.

August 17. NEW MALDEN.—Provision and erection of new iron and timber and brick and slated buildings at Norbiton Common Farm, New Malden, Surrey, for the Guardians of the Kingston Union. The drawings and specifications may be seen, and bill of quantities and form of tender obtained, on application to W. H. Hope, C.E., architect, 12, Clarence Street, Kingston-on-Thames, upon payment of the sum of £2. Tenders to be delivered to J. Edgell, solicitor, clerk to the Guardians, Union Offices, Coombe Road, Kingston-on-Thames, not later than August 17. Fair wages clause.

August 17. RAINHAM.—Erection of an enlargement to provide additional accommodation for 150 scholars to the Council School, at Rainham, Kent. Plans and specification, prepared by G. E. Bond, and conditions of contract, may be inspected at the offices of the architect, High Street, Rochester. Any person desiring to tender and to receive copy of the bills of quantities, must send his name to F. W. Crook, secretary, Caxton House, Westminster, S.W., accompanied by a deposit of £1, not later than noon on August 8. Tenders on the form to be supplied with the bills of quantities, must be enclosed in a sealed envelope, endorsed "Rainham Tender," and delivered to the School Correspondent, G. Quinnell, Russels, Rainham, Kent, not later than noon on August 17.

August 18. ABERCYNON.—Erection of fourteen or more semi-detached houses in Lock Street, Abercynon, for the Taff Building Club, Abercynon. Plans and specification may be seen at the office of W. Dowdeswell, architect, Treharris. Tenders, endorsed "Cottages," to be sent to J. Sutherland, chairman, Selma House, Abercynon, on or before August 18.

August 19. LONDON (E.).—Erection of verandah outside the children's block at the Poplar Workhouse, for the Borough Board of Guardians, in accordance with drawings and specifications prepared by their architects, J. and W. Clarkson, 136, High Street, Poplar, E. The drawings and conditions of contract may be seen at the offices of the architects, as above, and a copy of the form of tender obtained upon payment to the architects of a deposit of £2 2s. Persons desirous of tendering for the work must send their names to the architects not later than August 19. Tenders sealed and endorsed "Tender for the erection of verandah outside the Children's Block at the Poplar Workhouse," addressed to G. H. Lough, clerk to the Guardians, 45, Upper North Street, Poplar, E., must be delivered to him not later than 6.30 p.m. on September 2. Parties tendering will be required to name two sureties, each of whom must be willing to be bound in half the amount of the contract for the proper fulfilment of the same. Fair wages clause.

August 24. WINDSOR.—Erection of the superstructure of the new barrack block, Victoria

Infantry Barracks, Windsor, in the London district. The plans and specification may be inspected at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., on August 6, 7, and 8. Applications for bills of quantities and form of tender must be received by the Director of Barrack Construction not later than August 11, and on payment of the sum of 10s. (not returnable) to him a copy of the same will be forwarded. Tenders, in sealed envelopes, marked "Tenders," are to be delivered not later than 12 o'clock noon on August 24, addressed to the Director of Army Contracts, War Office, London, S.W. The bills of quantities are to accompany the tender, in separate sealed envelope, similarly addressed, and marked "Bills of Quantities for Work at the Victoria Infantry Barracks, Windsor," and also with contractor's name and address.

August 27. DERBY.—Erection of a children's ward block at the Derbyshire Royal Infirmary. Tenders are invited from Derbyshire builders. Applications must be made to E. Forster, superintendent and secretary, not later than August 12, and each application must be accompanied by a deposit of £2 2s. Bills of quantities will be forwarded to builders who have complied with the above conditions as soon as ready. Plans and specification may be seen at the Infirmary, between 2 and 4 p.m., from August 18 to 26, both dates inclusive. Tenders must be delivered at the Infirmary not later than 10 a.m. on August 27, addressed to the Weekly Board, Derbyshire Royal Infirmary, Derby, and be endorsed "Tender for Building Children's Ward Block," without which they will not be considered.

No date. FERMOY.—Rebuilding three business premises in Fermoy, plans of which and all particulars can be had on application to A. Hill, B.E., F.R.I.B.A., architect, 22, George Street, Cork.

No date. BELLAGHY.—Erection of a teacher's residence at Bellaghy, Co. Derry, for the Rev. Peter M'Namee, P.P. Plans and specification may be obtained upon application at the Parochial House, Bellaghy, or at the offices of J. V. Brennan, C.E., architect, Belfast Bank Chambers, Belfast.

No date. PUDSEY.—Erection and completion of the Pudsey Secondary and Technical Schools. Persons willing to tender for the various works are requested to forward their names and addresses to Jowett Kendall and Sons, architects, Leeds and Pudsey. Quantities will be forwarded when ready. Plans may be seen and further particulars obtained at the architects' offices, 10, East Parade, Leeds.

No date. DUBLIN.—Rebuilding Nos. 1, Suffolk Street, and 4 and 5, Church Lane, Dublin, for P. Hogan. Applications for bills of quantities to be made to J. G. Clayton, surveyor, 18, Nassau Street, Dublin, accompanied by cheque for £2. Fully priced bills of quantities, in separate sealed envelope, to be forwarded, with sealed tenders, to G. P. Sheridan, F.R.I.A.I., Architect, 25, Suffolk Street, Dublin. The plans and specification can be inspected at the offices of the architect.

No date. CARDIGAN.—Work proposed to be carried out at the following Council schools, for the County Education Committee:—Trefeirig (builder and painter), Commins Coch (carpenter and painter), Talybont (painter), Llandyssul (carpenter), Brongest (painter), Brongest (carpenter), New Quay (paving mason), Penlon (paving mason). Specification can be seen (and plans in certain cases) and full particulars obtained from the respective headmasters, or at the office of G. Dickens-Lewis, M.S.A., county architect, Aberystwyth.

ENGINEERING.

August 6. OLLERTON, NOTTS.—Supplying, excavating for, laying, and jointing of about 2¼ miles of 4in. and 3in. cast-iron mains, valves, hydrants, etc., the erection of small brick service reservoir, and all works in relation thereto at Ollerton, Notts., for the Southwell R.D.C. Plans and specifications may be seen, and copies of quantities and form of tender obtained, from Sands and Walker, engineers, Milton Chambers, Nottingham, on payment of £2 2s. (by cheque). The successful contractor will be required to enter into a bond with approved sureties for the due performance of his contract. Sealed and endorsed tenders to be sent to G. E. Kirkland, clerk to the Council, Southwell, Notts., on or before August 6.

August 7. CHICHESTER.—Repair of Dell Quay, Chichester Harbour. The work is to be done in ferro-concrete, and relates to the head of the quay only. The work consists of, approximately, 18 ferro-concrete piles, 12in. by 12in. by 21ft., and the necessary concrete filling and walling. For further details apply to F. J. Lobley, A.M.Inst.C.E., city surveyor, Lion Street, Chichester, during the usual hours. Tenders, upon forms to be provided, to be delivered at the office of J. L. Cooper, town clerk, Chichester, not later than noon on August 7.

August 8. BEARPARK.—(a) Erection of concrete supports, etc., and (b) providing and erecting thereon steel lattice girders, etc., required in the construction of a foot bridge over the River Browney at Bearpark Colliery. Plans, specifications, and conditions of contract may be seen at the office of the clerk to the Witton Gilbert Parish Council, Sacriston, to whom tenders must be delivered, endorsed "Browney Foot Bridge," by August 8.

August 10. WESTCRAIGS.—Cutting and refilling 5,400yds. of track for 10-in. and 9-in. water pipes at Westcraigs; also carting 410 tons of pipes over track, for the Bathgate District Committee. Sealed offers, marked "Tender for Pipe Track," to be addressed to J. G. B. Henderson, county clerk, Linlithgow, not later than August 10.

August 10.—WESTBURY.—Providing and laying 840yds. of 2in. cast iron water mains, etc., near the village of Chapmanslade, Westbury, Wilts, for the Westbury and Whorwellsdown R.D.C. Persons desirous of tendering can inspect the plans and specifications for the same at the offices of W. H. Stanley, A.M.I.C.E., engineer, Market House Chambers, Trowbridge. Sealed tenders, on forms to be obtained of the engineer, endorsed "Tender for Water Mains, Short Street," to be delivered or sent to J. Callaway, clerk to the said Council, Westbury, Wilts, on or before August 10.

August 10. ACTON.—Erection of two water softeners, in connection with the two Babcock and Wilcox tubular boilers (heating surface, 1,741 sq. ft. each), to be installed at the Dust Destructor, "The Friars," Acton, for the U.D.C. The water to be evaporated every 24 hours by each of the boilers would amount to 4,200 gallons, and the water to be used is that supplied by the Metropolitan Water Board. Firms tendering are invited to give particulars of the apparatus suggested, references where is has been found suitable, and the cost of installation. A block plan of the site of the destructor may be seen at 57, High Street, Acton, where tenders in sealed envelopes, endorsed "Water Softeners," are to be delivered not later than 3 p.m. on August 10. Canvassing the members or officials of the Council will disqualify.

August 12. ABERDOUR.—(1) Excavation, embankment, etc., work to be executed in constructing an embankment across part of thet reservoir at Cullaloe; (2) Providing and laying about 100 tons C.-L. pipes, valves, etc., in connection therewith. Schedules for these works may be had from J. A. Waddell, burgh surveyor, Burntisland, on payment of £1, and copies of the plans may be seen in his office, or at Cullaloe Reservoir, Aberdour. Tenders, marked outside, should be lodged with T. A. Wallace, town clerk, not later than August 12.

August 12. MANCHESTER.—Concrete, etc., steelwork, and cast-ironwork in connection with alterations to No. 2 Boiler House, at the Stuart Street Works, for the Manchester Corporation Electricity Committee. Forms of tender and quantities may be obtained on application to F. E Hughes, secretary, Electricity Department, Town Hall, Manchester, and drawings may be inspected at the offices of C. S. Allot and Son, civil engineers, 46, Brown Street, Manchester. Tenders to be addressed to the Chairman of the Electricity Committee, and delivered at the Town Hall not later than 12 noon on August 12.

August 15. MANCHESTER.—Supply and erection of hydraulic and steam valves, cast-iron, steel, and wrought-iron pipes, fittings, etc., for the Waterworks Committee, required in connection with the new Hydraulic Pumping Station, Water Street, in this city. Conditions of contract, specification, and form of tender may be obtained on application to the Secretary, Waterworks Offices, Town Hall, Manchester, on payment of £1 1s. Sealed tenders, endorsed "Hydraulic Power, Tender for Valves and Pipes," and addressed to the Chairman of the Waterworks Committee at the above offices, must be delivered not later than noon on August 15.

August 15. ABERDARE.—Construction and erection of a refuse destructor, clinker, plant, and mortar mill. Conditions, and particulars, together with a plan of site, may be obtained from the surveyor, Town Hall, Aberdare. Tenders, with plans, etc., endorsed "Destructor," to be delivered to T. Phillips, clerk, Town Hall, Aberdare, on or before August 15.

August 19. MELTON MOWBRAY.—Construction of the following works, for the U.D.C.: — An engine-house and suction tank, together with boilers, engines, centrifugal pumps, and about 900 yds. of 12 in. cast-iron rising main. Purification works, consisting of four settling tanks, first and second series bacteria beds, and other works in accordance with the specification and plans prepared by J. Taylor, Sons and Santo Crimp, civil engineers. Copies of the specification and quantities, with form of tender, may be obtained from, and the drawings inspected at the offices of, the aforesaid firm of engineers, at Caxton House, Westminster, upon payment of £5 (cheque only). The plans may also be inspected at the office of E. Jeeves, surveyor to the Council, Nottingham Street, Melton Mowbray. Tenders, endorsed "Melton Mowbray Drainage," are to be delivered to R. Barker, clerk, U.D.C. Office, Melton Mowbray, at or before noon on August 19.

August 24. BRUMBY AND FRODINGHAM.—Contract No. 1. — Supply and erection of four fifty-gallons sewage ejectors, electrical motor, oil or petrol engine, two air-compressors, switchboard and engine accessories, also for about 390 yds. of cast-iron air mains, 630 yds. of cast-iron rising mains, and 600 yds. of electric cable laid complete, for the U.D.C. Plans and sections of the proposed works may be seen, and specifications and bills of particulars, together with forms of tender, may be obtained on application to Strachan and Weekes, civil engineers, 9, Victoria Street, Westminster, London, on payment of a deposit of £3 3s. by cheque. Sealed tenders, endorsed "Tenders for Sewage Ejectors," are to be delivered at the office of G. S. Sowter, clerk, Brigg, on or before August 24.

August 27. LICHFIELD.—Provision, laying, and jointing of about 1,020 yds. of cast-iron pipes, 3 in. diameter, and other works in connection therewith, for the R.D.C., in accordance with the drawings, specifications, and instructions of their engineer. Drawings may be seen, and copies of the specification, form of tender, and bill of quantities obtained, at the office of W. E. Rogers, Council's engineer, Anson Street, Rugeley, on payment of a deposit of £1 1s. Sealed tenders, endorsed "Tender for Water Supply, T. V. Station, Rugeley," to be delivered at the office of J. Derry, clerk to the Council, R.D.C. Offices, Lichfield, not later than August 27.

No date. VENTNOR (I.W.).—Construction of a sea-wall at Ventnor (I.W.). For particulars apply to Bull and Porter, auctioneers and land agents, or to E. J. Harvey, architect and surveyor, Ventnor (I.W.).

IRON AND STEEL.

August 6. TOTNES.—Supply of new or second-hand cast-iron water pipes of the following sizes, to be delivered at the following places, in the undermentioned quantities:—Two 12in. pipes, six 7in. pipes, eight 9 in. pipes, six 8 in. pipes, six 7 in. pipes, and twenty 6 in. pipes, approximate weight 8 tons, to be delivered at Wrangaton Railway Station. Six 4 in. pipes, twenty-five 6 in. pipes and fifteen 8 in. pipes, approximate weight 6 tons to be delivered at Totnes Railway Station. Pipes to be spigot and socketed. Tenders, stating whether new or second-hand pipes, and stating weights and thicknesses of pipes, to be sent to F. K. Windeatt, clerk to the R.D.C., 19, High Street, Totnes, on or before twelve noon on August 6.

PAINTING AND PLUMBING.

August 8. PAR.—Varnishing, colouring, and painting United Methodist Church, Par.—Apply Rev. W. Butt, St. Blazey Gate, by letter, before August 8.

August 10. ISLE OF WIGHT.—Outside painting for the Committee of the Royal Isle of County Hospital and Convalescent Home. A copy of the specification may be had on application to the secretary at the Hospital. Sealed tenders, marked outside "Tenders for Painting," must be delivered at the Hospital not later than August 10.

August 10. STOURBRIDGE.—Painting the outside wood, stone, and ironwork (including shelters) of the Corbett Hospital, Stourbridge, same colours as before, with three coats of good oil paint, and the woodwork to be varnished with best outdoor varnish. Tenders to be sent to J. D. Harward, secretary, Stourbridge, not later than August 10.

August 14. STOURPORT.—Painting of the ironwork of Stourport Bridge over the River Severn, for the Highways and Bridges Committee of the C.C. Specification and further particulars may be obtained on application to J. H. Garrett, surveyor of county bridges, Shirehall, Worcester. Tenders must be sent in to him not later than August 14.

August 19. NORWICH.—General repairs and painting, cleaning, etc., of offices, in St. Andrew Street, for the Guardians of the Poor of the Incorporation, in accordance with specification prepared by their architect and surveyor. Specifications, with forms of tender, may be obtained of Morgan and Buckingham, architects and surveyors, Upper King Street, Norwich, and must be sent to E. J. W. Huggins, clerk, at the Guardians' Offices, St. Andrew Street, at or before 10 a.m., August 19. Fair wages clause.

No date. SALFORD.—Painting the outside of Broughton Baths, and the outside of Regent Road Baths. Specification and form of contract from Mr. W. J. Ellis, superintendent, Blackfriars Road Baths, Salford.

No date. BURSLEM.—Painting and renovation of the following schools:—1, Longport; 2, Park Road; 3, Jackfield, for the Education Committee. Particulars may be obtained upon application to A. R. Wood and Son, architects, Market Place, Burslem, at once.

ROADS AND CARTAGE.

August 7. BROADWOODWIDGER, DEVON. — Steam rolling the main and district roads, for the R.D.C., commencing September 21, 1908. Contractors must supply two rollers, between 10 and 12 tons, with two water-carts, and hose, with each roller, if required; also living vans, coal delivered to rollers, oil, waste, drivers, and extras. The

rollers will be required for about 50 days each roller, more or less. For further particulars apply to S. Warren, surveyor, Kennacott, Yeolmbridge, near Launceston. Sealed endorsed tenders to be sent to Geo. Graham White, Launceston, clerk to the above Council, on or before August 7.

August 8. CORNWOOD.—Repair of path over Headon Down, leading from Gibhill Gate, Lutton, to Quick Bridge. Plans and specifications can be seen by applying to S. Mudge, clerk to Parish Council, Cornwood, and to whom tenders are to be delivered on or before August 8.

August 8. MANCHESTER.—Works required in making up Parkfield Road, Didsbury (Rock Asphalt); Beaver Road, Didsbury (Tar Macadam); Old Hall Lane, Withington (Sett Paving), for the Withington Committee. Plans, sections, and specifications of the work can be seen and a form of tender with quantities and any further information obtained from the surveyor to the Committee, Town Hall, West Didsbury. Tenders to be endorsed "Tender for Street Works," and to be addressed to the chairman of the Withington Committee, Town Hall, West Didsbury, not later than noon on August 8.

August 8. SOUTHGATE.—Making up of seven private streets for the U.D.C., of a total length of about 2,466 yards. Plans may be seen on application to C. G. Lawson, C.E., Council's surveyor, from whom copies of the specifications, conditions of contract, and form of tender may be obtained on depositing £2 in cash. Tenders, endorsed "Private Streets," must reach W. M. Ellenor, clerk of the Council, Council Office, Palmer's Green, N., not later than noon on August 8.

August 10. LEEDS.—Paving and flagging of the following streets:—Hope Grove, Bankfield Gardens, Woodview Road (part), Tempest Road (part), and Vicarage Terrace (part), for the Highways Committee. Drawings may be seen at the city engineer's office, Municipal Buildings. Forms of tender and bills of quantities may be obtained, and copies of the documents forming the contract inspected, on application at the Highways Office, 155, Kirkstall Road. Sealed tenders, endorsed "Tender for Private Street Works," and addressed to the Highways Committee, must be delivered at the town clerk's office, Town Hall, Leeds, not later than 10 a.m. on August 10.

August 10. LONDON, S.E.—Cartage and removal of the several portions of a corrugated iron and wood building, recently pulled down, from the infirmary, Lower Road, Rotherhithe, S.E., and to deposit the same at the schools, Wickham Road, near Croydon, for the Guardians of the Parish of Bermondsey. The several portions of the building have been marked, so as to assist in the re-erection of the same, and the contractor will be required to deliver and deposit at the schools the various portions of the building in proper order, so as not to cause any inconvenience in the re-construction of the building. The building can be seen on application to the clerk to the works, on the premises. Persons desirous of tendering for the work may obtain printed forms (which only can be received) at the office of E. P. Fenton, clerk, 283, Toole Street, S.E., between the hours of 10 a.m. on 12 noon. Sealed tenders, endorsed "Tender for Cartage of Iron Building to Schools," must reach the clerk at his office not later than 10 a.m. on August 10.

August 11. FRINTON-ON-SEA.—Construction of certain works in Fourth Avenue, for the U.D.C. The principal items are: About 9,000 yds. super slag tar-macadam carriageway; about 7,000 yds. super tar-paved footway; about 2,000 yds. super limestone kerbing, and 18 street gullies. Also for sewering the roadway known as The Crescent, including about 770 ft. of 9 in. pipe sewer; about 130 ft. of 6 in. pipe sewer, and 8 street gullies. Bills of quantities and forms of tender may be obtained and the general conditions, specifications and drawings inspected on application to E. M. Batf, surveyor to the Council, Council Offices, Frinton-on-Sea, Essex, on payment of £2 2s. for both or either set of quantities. Each tender to be delivered to the Council Offices, Frinton-on-Sea, in a sealed cover, and addressed to the Surveyor to the Council, and marked "Fourth Avenue," or "The Crescent." No tender will be received after the morning of August 11.

August 11. CREWE.—Sewering, forming, macadamising, footpath paving, curbing, and channelling of Elizabeth and Fletcher Streets, and for forming, macadamising, footpath paving, curbing, and channelling of Mirion, Manning, Wallis, and Brierley Streets, and for the following back passages, viz.:—Passage from 10 to 36, Bedford Street, passage from Richmond Road to Queen Street, passage between Richmond Road and Queen Street, passage from Hall-o'-Shaw Street to Vincent Street, passage between Hall-o'-Shaw Street and Vincent Street, and passage at rear of 8 to 15, Hall-o'-Shaw Street, within the borough, in accordance with plans, sections, and specifications, which may be seen and all other necessary information obtained upon application to G. Eaton-Shore, borough surveyor, Earle Street, Crewe. The contractor must provide the whole of the materials, viz.:—Sewer pipes, paving bricks, kerbs, setts, macadam, screenings, gullies, gully grids, manhole covers and frames, etc., required in the making, etc., of the above streets and passages. A deposit of £1 will be required. Sealed tenders and schedule of prices, upon printed forms, to be obtained from the borough surveyor, must be delivered at the office of F. Cooke, town clerk, Municipal Offices, Crewe, not later than nine o'clock in the forenoon of August 11, endorsed "Tender for Street and Passage Making." No tender will be accepted unless made out on the printed forms above-named, with all the items in the schedule of prices fully priced.

August 15. THIRSK.—Tar macadamising about 3,300 sq. yds. of a certain portion of the highway in the parish of Sowerby, for the R.D.C. Form of tender and specification may be obtained from R. R. Wright, Council's surveyor, Thirsk, on receipt of a stamped addressed foolscap envelope on and after August 3. Sealed tenders, endorsed "Tender for Tar Macadamising," to be sent to W. Swarbreck, clerk, Council Offices, Finkle Street, Thirsk, not later than 12 o'clock at noon on August 15.

August 22. STOURTON.—Levelling, paving, flagging, kerbing, and making good of 12 streets, at Stourton, comprising in all about 750 yds. in length of streets, for the Rothwell U.D.C. Plans, sections, etc., may be seen, and specifications, conditions, and bills of quantities may be obtained on application to J. Southwart, surveyor, Council Offices, Rothwell, on deposit of cheque made payable to the treasurer, for £2 2s. Sealed tenders, together with fully priced quantities, endorsed "Private Street Works," must be delivered not later than August 22, addressed to W. Dodgson, clerk, Council Offices, Rothwell, Leeds.

August 22. BLAINA.—Supply of road metal, as follows, for the Naneyglo and Blaina U.D.C.: 300 tons of limestone, broken to pass through a 2½ in. ring, and to be rejected by a 1¼ in. ring, 250 tons to be delivered at Blaina Station, G.W.R., and 50 tons at Brynmawr Station, L. and N.W.R.; 60 tons of granite, hand broken, to pass through a 2½ in. ring, and to be rejected by a 1¼ in. ring, 50 tons to be delivered at Blaina Station, G.W.R., and 10 tons at Brynmawr Station, L. and N.W.R. 80 tons of clean limestone chippings, 70 tons to be delivered at Blaina Station, G.W.R., and 10 tons at Brynmawr Station, L. and N.W.R. 10 tons of clean granite chippings, to be delivered at Blaina Station. Deliveries are to be made carriage paid, and according to the order of the Council's surveyor. Tenders to be sent to H. J. Shepard, clerk, Tredegar, and samples to be sent to W. J. Davies, Blaina, the Council's surveyor, not later than August 22. The person whose tender is accepted will be required to execute a formal contract and bond, with sureties.

No date. YORK.—Estimates wanted for tar-paving. For particulars apply F 352, "Herald" Office, York.

No date. GREENFORD.—Supply of about 500 to 1,000 tons of road gravel, picked chalk flints, and granite, to be delivered in or between the months of September, 1908, and January, 1909, for Greenford U.D.C. Tenders must be on the forms to be obtained from W. H. Read, F.S.I., surveyor, The Avenue, West Ealing.

SANITARY.

August 8. RUISLIP.—Construction of 1,148 yds. of pipe sewer, for foul and surface water, raising roadway, together with manholes and other appurtenant work, at Sharps Lane, Ruislip, for the U.D.C. Drawings and specification may be seen and bills of quantities and form of tender obtained from W. L. Carr, surveyor, Council Offices, Northwood, Middlesex, on payment of a deposit of £1. Sealed tenders, endorsed "Sewer Extension," to be delivered at the office of E. R. Abbott, clerk, Council Offices, Northwood R.S.O., Middlesex, not later than 10 a.m. on August 8.

August 8. WISHAW.—Excavating of and lifting present sewers, consisting of 12-in. and 15-in. fire clay pipes for a distance of about 676 lineal yards, deepening trench, providing and laying about 47yds. of 15-in. spigot and faucet fire clay pipes, 176 lineal yards of 18-in. spigot and faucet fire clay pipes, and 453 lineal yards of 21-in. spigot and faucet fire clay pipes from near junction of Carfin Road and Shieldmuir Street, along Craigneuk Street to present manhole at Robberhall Road, for the provost, magistrates, and councillors of the burgh of Wishaw, all in said burgh, and any other work that may be required, including manholes, lampholes, etc., in connection therewith. Drawings may be seen at the office of W. Rodger, C.E., burgh engineer, Wishaw, from whom copies of specification and schedule of quantities may be obtained, on payment of a fee of £2 2s. for each copy. Tenders, which shall remain open for acceptance till August 22, must be lodged with J. L. Jack, town clerk, Burgh Chambers, Wishaw, on or before August 8, by 10 o'clock a.m., in sealed envelopes, marked "Tender for Sewer in Craigneuk."

August 10. WAINGROVES.—Construction of sewage disposal works at Waingroves, for Ripley Urban District Council, comprising subsidence tanks, percolating filters, and other appurtenant works. Particulars on application to the consulting engineers, Messrs. Herbert Walker and Son, King Street, Nottingham, or to Mr. George W. Bird, surveyor to the Council, Town Hall, Ripley, Derby. A deposit of £1 1s. required. Tenders to be delivered not later than noon on August 10, endorsed "Tender for Waingroves Sewage Disposal Works," to Geo. M. Capon, clerk, Town Hall, Ripley, Derby.

August 11. WOKING.—Construction of about eight miles of stoneware and cast-iron pipe sewers, manholes, and pumping station. Drawings, conditions of contract, specification, and bills of quantities at the offices of Mr. G. J. Wooldridge, the Engineer to the Council, Council Offices Woking. Copy of the specification, bills of quantities, and form of tender may be obtained from the engineer on payment of five pounds. Tenders, enclosed in sealed envelopes, addressed to the Clerk of the Urban District Council of Woking, and endorsed "Tender for Horsell Drainage," to be delivered at the Offices of the Council not later than noon on August 11.

August 15. REIGATE.—Providing and erecting complete one Shone's automatic sewage ejector, 150 gallons' capacity, at the South Park Ejector Station, within the borough of Reigate, in accordance with the plans, sections, and specification prepared by F. T. Clayton, borough engineer and surveyor. Plans and specification may be inspected and forms of tender, with any other information, can be obtained, upon application to the borough engineer, Municipal Buildings, Reigate. The contractor whose tender may be accepted will be required to enter into a contract in writing, the form whereof may be seen at the office of A. Smith, town clerk, and himself and his surety or sureties will be required to enter into a bond for the fulfilment of the contract. Sealed tenders, addressed to the town clerk, endorsed "Tender for Ejector, South Park," are to be delivered at the Municipal Buildings, Reigate, not later than August 15.

August 17. PRENTON.—Construction of a sewer and appurtenant works in Storeton Road, in the township of Prenton, for the Wirral R.D.C. The work will consist of about 355 lineal yds. of stoneware pipes 9 in. in diameter, with manholes, and other works. The drawings and specification may be seen between the hours of 11 a.m. and 4 p.m., and 11 a.m. and noon on Saturdays, at the office of F. E. Priest, M.Inst.C.E., engineer, 13, Harrington Street, Liverpool, from whom copies of the specification, form of tender, and bill of quantities may be obtained on deposit of £1 1s. Tenders must be delivered to J. E. S. Ollive, clerk, 54, Hamilton Street, Birkenhead, before 9 a.m. on August 17.

August 22. GLASGOW.—Construction of the storm-water overflow sewer, extending from the River Clyde, in line of West Street, to the overflow chamber in Saint Andrew's Road, opposite McCulloch Street, a distance of about 1,380 lineal yds. Plans, specifications, and working drawings may be seen, and specifications and schedule of quantities and forms obtained, on application to the city engineer, City Chambers, 64, Cochrane Street, Glasgow, on payment of a fee of £5 5s. Sealed offers, marked outside "Tender for Storm-water Overflow Sewer," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than August 22. The resident engineer will meet intending offerers at Clyde Place, at the foot of West Street, at the east end of Kingston Dock, on August 11, at 11 o'clock forenoon.

August 31. CHAPELHALL.—Construction of sewage purification works, and intercepting and outfall sewers, near Souchenbog Bridge, Chapelhall, for the District Committee of the Middle Ward of County of Lanark. Plans may be seen and copies of the specification and schedule of measurement obtained at the office of W. L. Douglas, M.Inst.C.E., district engineer, District Offices, Hamilton, on payment of £1. An assistant engineer will meet intending contractors at Sauchenbog Bridge, at 11.35 a.m on August 6. Sealed tenders, endorsed on outside "Chapelhall Purification Works," must be lodged with W. E. Whyte, district clerk, Hamilton, not later than 10 a.m. on August 31.

No date. LITTLEBOROUGH (Manchester).—Construction of 200 yds. of 15-in. and 260 yds. of 12-in. pipe sewer from Halifax Road to Hollingworth Road, together with manholes, etc. Persons desirous of tendering may obtain quantities and inspect plans and sections on application to the surveyor, Hare Hill.

No date. DUNFERMLINE.—Excavation, tunnelling, etc., in the construction of a new outfall sewer between the Burgh of Dunfermline and Ironmill Bay, Charlestown. (Contract No. 1) Particulars from the Burgh Engineer on deposit of £3 3s.—Providing, laying, and jointing of reinforced concrete sewer tubes between the Burgh and Ironmill Bay, Charlestown. (Contract No. 2). Particulars on deposit of £3 3s. with Andrew W. Bell, Burgh Engineer, Burgh Chambers. Dunfermline.

ENGINEER wants post, London or provinces; 12 years' experience; or undertakes preparations, calculations, quantities, designs, detail drawings, structural steelwork, and reinforced concrete.—Box 4451, BUILDERS' JOURNAL Office.

EXPERT all-round Engineering draughtsman (over 10 years' experience) wishes for occasional work at his own home, or otherwise; lowest terms.—Freeman, 44, Horsell Road, Highbury, N. 4416

FOREMAN painter and decorator (well-experienced) wants re-engagement; not afraid of work. First-class references. Age 37.—Foreman, 16, Gambole Road, Garratt Lane, Tooting. 4431

FOREMAN of painters and decorators, take entire management of flats or estate; town or country; well up in all branches of building trades; total abstainer.—C/o G. N., Sanitary Works, Bridge Road, Chertsey. 4420

FOREMAN seeks engagement; shop or building; carpenter, joiner, practical, machinery, quick setter out; last refs. 7 years; age 38.—C. M., Cedars, Spring Road, Kempston, Bedford. 4483

GENERAL Foreman, clerk of works, foreman mason, or estate manager, 9 years last situation; experienced in all trades; abstainer.—Allen, 35, Princes Street, Peterboro'. 4334

GOOD shopfitter and case-maker requires constant job; abstainer; refs. if required. Indoor hand. — Box 4388, BUILDERS' JOURNAL Office.

GENERAL Foreman, of large and varied experience, thoroughly conversant with every branch of the trade, pushing and punctual; open to undertake any job; none too large; wages moderate.—J. M., 22, Eve Road, Tottenham. 4466

IMPROVER (Plumbing, Gasfitting), wants situation. Willing to fill up time.—A. R., 344, Commercial-road, Old Kent-road. 4455

IMPROVER or junior assistant (22), student R.I.B.A., excellent knowledge, practical building construction experience, supervising, neat draughtsman, surveying; assist quantities; small salary, specimens; good references.—Box 4090, BUILDERS' JOURNAL Office.

IMPROVER or junior assistant (21) desires position with architect or surveyor; working drawings, quantities, surveys, qualified P.A.S.I.; nominal salary.—R. R. F., 25, Queen Street, Hemel Hempstead. 4321

JUNIOR Draughtsman (19), desires re-engagement; assist generally; good refs.; town and country; shorthand; probationer; R.I.B.A. — C. Weston, The Laurels, Rotherfield, Tunbridge Wells. 4376

JUNIOR Assistant (20) requires situation in surveyor's or builder's office, 3 years' experience with London surveyor; can assist in abstracting, working up, variations, etc.; willing worker.—W. Cooke, 102, Faraday Road, Wimbledon, S.W. 4333

JOINER-MACHINIST, or general assistant; used to office, bench, or building work, planer, saw, spindle, mortise, or entirely bench; construction certificates; good draughtsman; abstainer; references.—Box 4419, BUILDERS' JOURNAL Office.

MACHINIST, good all-round, wants job, town or country; take charge or otherwise, thorough knowledge of gas-engine; good refs.—T. S., 4, York Terrace, King's Road, Herne Bay. 4450

PRACTICAL Machinist (joiner), requires situation; good spindle hand.—H. Cruse, Boxford, Newbury, Berks. 4467

PLUMBER (Registered) wants re-engagement as leading hand or otherwise. Thoroughly practical in all latest sanitary improvements. Town or country.—R. P., 18, Chertsey Street, Tooting, S.W. 4482

PLUMBER (gas and hot-water fitter) wants job; well up in all branches; would supply all tools; not afraid to turn hand; would suit builder or jobbing man; town or country; wages, 8½d. per hour for constant employment.—S. K., Shanklin, Benhill Road, Sutton, Surrey. 4463

SANITARY Drainer (competent), wants situation; good work; iron or earthenware; take charge; 15 years' experience; good references; age 36.—W. Gent, 42, Westbrook Road, Thornton Heath. 4478

STOREKEEPER and yardman (age 28), seeks re-engagement in builder's yard. Well up in booking materials in and out works. Fifteen years' experience. First-class references. Distance no object.—M. Poole, 12, Jardin Street, Albany Road, Camberwell, S.E. 4477

THOROUGHLY competent builder's book-keeper and general assistant requires engagement, 15 years' experience in London with builders and shopfitters; good reasons for leaving present berth; excellent references. Age 32.—Apply Box 4474, BUILDERS' JOURNAL Office.

THE ESTATES MANAGER AND AGENT to well-known public institutions. London estates (comprising over 1,000 properties), holding appointment, over 11 years, desires similar appointment in town or provinces, with view to improving his position; exclusive knowledge and experience in management of leasehold and troublesome weekly properties; thoroughly qualified architect and surveyor; administrative ability and experience in rent collecting; highest references. — Apply Box 4337, BUILDERS' JOURNAL Office.

WANTED, architect and surveyor's assistant, shortly disengaged; thorough general experience; quick and accurate draughtsman; supervising; entire charge.—Box 4447, BUILDERS' JOURNAL Office.

YOUTH (age 18) requires situation in builder's or surveyor's office. Desirous of learning estimating. Three years' previous experience.—Apply W. B., 8, Medley Road, West Hampstead, N.W. 4447

YOUTH seeks situation with architect or builder; good tracer, well up in p.c. and office work; excellent references.—J., 164, Wellesley Road, Ilford, Essex. 4485

Appointments Vacant.

EXPERIENCED representative wanted by well-known firm of lock manufacturers; must have influential connection amongst leading architects and contractors in London district; state salary required and full particulars of experience. — Box 4427, BUILDERS' JOURNAL Office.

TRAVELLER wanted, with established connection amongst architects, builders, contractors, decorators, etc., to sell our Artificial Marble, on salary and Commission; must have exceptional references as to ability. Apply by letter only, giving full particulars, and stating terms required, The Fassio Marble Company, Ltd., 46, Cannon Street, London, E.C. 4449

WANTED, for a permanency in the office of an old-established firm of surveyors in the city, a youth of good appearance and education, with previous office experience, who can write a good hand, quick and accurate.—Apply, in own handwriting, with copies of testimonials, stating salary asked, to Box 4457, BUILDERS' JOURNAL Office.

Exterior Ironwork.

It is but two or three years back that the gates and railings encircling Old Palace Yard, Westminster, were in the hands of the ironworkers for extensive repairs, and the present time finds them once more undergoing a complete overhaul. However much one may admire the wealth of detail that Barry and Pugin lavished on the exterior of the Palace of Westminster, it is a question whether such intricacy of ornament is altogether suitable in a climate like ours, and particularly so in the case of the gates and railings. These are built up of numbers of different members bolted together; the lower part is a trellis of small squares, each square containing a rose or other device of very thin metal, probably an eighth-of-an-inch only in thickness. The same condition of things obtains in the ugly railings that surround the lawns of Parliament Square. With the immense amount of lodgment space for wet the inevitable happens. Water penetrates the crevices between the members, and starts corrosion; the thin flowers are rapidly eaten away, and so a periodical reparation becomes imperative. It need hardly be said that this is an expensive matter. The replacng of defective pieces means the making of new parts to special pattern, and the intricacy of the ironwork itself adds to the amount of work and naturally to the cost.

The moral for the architect is plain. Whether he favours Gothic or Classic the design of his exterior ironwork should be simple and straightforward; the various members as substantial in section as they can be made without appearing clumsy and heavy. When one views the condition of exterior ironwork dating from the 17th and 18th centuries with that of the Houses of Parliament dating from the middle of the 19th century, the moral becomes too plain to be ignored.

Experiments in Street Lighting.

The experiments in street lighting in the City of London that are now being conducted by the Charing Cross and Strand Electricity Supply Co. and by the City of London Electric Lighting Co. respectively should go far towards determining the best form of lamp to use, and the most effective position and support for it. The Charing Cross Co. are lighting Cannon Street with eleven magazine "flame" arcs, five of the Oliver type and six of the Gilbert type. The arcs are centrally hung, being suspended over the roadway by means of wires attached to the buildings on both sides. The City of London Co. have substituted twenty-one Oliver flame arcs for a similar number of the original arcs in the existing columns on Holborn Viaduct, as well as in part of the Old Bailey, whilst in Farringdon Street eighteen enclosed arcs of the "Reason" type have been fitted up on special short columns in substitution for the twelve original arc lamps and columns in that thoroughfare. It is stated that the maintenance cost of flame arcs is £17 10s. each per annum, and of enclosed arcs £12 10s. In all there are 451 public electric lamps in the City of London, 400 of the original type, thirty-three flame arcs, and eighteen enclosed arcs. The cost of the original arcs is £26 each per annum. The results of these experiments are to be made public in a few months, and will no doubt receive the close attention of all who are interested in ascertaining what is really the best type of lamp, and whether the column or the suspension system is to prevail. Presumably both will continue in use; for it strikes us that, unfortunately, the column system must almost inevitably be adopted where the suspension system would be most valuable—that is, in the very widest streets, where the advantage of central illumination is obvious.

Craftsmanship and Drawing.

We are thoroughly in accord with the tenor of Mr. W. H. Berry's remarks in the paper on craftsmanship and the schools of art, which he read at the International Art Congress last week. He pointed out that in many schools draughtsmanship appeared to be the end of the teaching, and therein lay a grave danger, for draughtsmanship could never be of much service in itself, and must rely upon its use as a decorative factor, or fail in large measure to justify the expenditure of time upon teaching it, yet there seemed to be no reason why the teaching of sound draughtsmanship should not be compatible with that of fine craftsmanship; indeed, it had been proved that the latter improved the former by teaching the student the art of selection. It was lamentable that many art schools had no appreciable effect upon the manufactures of the districts in which they were situated. In such cases there must be something wrong, either in the organisation of the schools or the curriculum to which they adhered. This could be remedied only by the decentralisation of the schools and by making their teaching practical. Were the schools of each district developed to fulfil to the utmost the particular work applicable to the industry in which the surrounding community was engaged, they would prove a force which manufacturers could not afford to scorn and would be pleased to help. Under the old and, in many cases, under the present system of instruction, the same education was given to students in all schools. In place of cultivating the actual practice of local industries, which offered many possibilities, it was too often the custom to make impossible designs for objects of a description produced in other parts of the country. By a process of decentralisation, districts or counties might be given a central institution in which their own teachers and students might be initiated into the practical as well as the æsthetic side of their education, and a system of co-operation might be devised by which the student could learn something of practice and theory simultaneously.

Preservation and Prevention.

The thirteenth annual report of the National Trust for Places of Historic Interest or Natural Beauty mentions, among many items of interest to architects and other students of buildings, an endeavour to prevent the addition of a vestry to the church at Stewkeley, in Buckinghamshire. This church is regarded as being one of the best complete examples of a Norman church in this country. It has an unaltered ground-plan, and as the council of the Society seem to have regarded this fact as the chief justification for their protest, it is to be feared that the faculty that has been granted may permit the violation of this interesting survival. Another interesting building that the Society have made a doubtfully successful effort to preserve, is the Court House at Udimore, near Rye, in Sussex, which is a picturesque two-storey half-timbered building dating, probably, from the fifteenth century. It is said to have been visited by Edward I. and Edward III., but as it was in a dilapidated condition, the owner, it was reported, had stated his intention of destroying it in order to erect modern cottages on the site. With the permission of the owner, the Society sent an architect to examine the building, and

NEW BUILDING FOR THE "WESTERN GANETTE," YEOVIL.
OATLEY AND LAWRENCE, ARCHITECTS.

he reported that it was capable of effective repair at a cost of £250, and of being fitted as three cottages at a further cost of £100 each, without destroying the original character of the building. The owner had not communicated his decision when the Society's report was prepared. There are fairly typical samples of the work that the Society is doing. It also concerns itself with the preservation of beauty spots from the hands of the builder. It must therefore often find itself in the curious position of saving the old from destruction, while preventing the erection of the new. It must be admitted, nevertheless, that, judging from the tone of the report and the record of its transactions, this Society's report was prepared. These are fanaticism that sometimes mars the efforts of similar institutions.

India's Architectural Remains.

In the first of what gives promise of being rather an important series of articles on "Archæology in India," a "Times" correspondent, in the issue of Monday last, presents some interesting particulars of the remains of early buildings in India. The ancient remains, he observes, are comprised in the three indigenous groups of Buddhist, Jain, and Hindu monuments, and to these may be added the foreign group of buildings erected by the Mahomedans from about 1200 A.D. onwards, the product of Saracenic art, which are preserved chiefly in northern India, and some of which, the correspondent declares, are among the finest architectural creations in the world. The Buddhists having been India's first builders in stone, theirs are the earliest remaining antiquities, and such monuments were begun about the middle of the third century B.C. under the Buddhist King Asoka, and extend over a period of about a thousand years. They consist of pillars, topes (structural relic or memorial mounds), churches, and monasteries. The Jain specimens are of much later date, none being assignable to a time prior to the first century A.D.; but in the best examples the interior carving and decorations are richer and more beautiful than any other in India, although the images are artistically inferior.

IN PARLIAMENT.

(By our Press Gallery Representative.)

Extension of the British Museum.

Mr. Harcourt has informed Sir William Bull that the delay in the building operations for the extension of the British Museum in Montagu Place has arisen in connection with the settlement of internal details, and the preparation of the drawings for the superstructure. It is anticipated that the work will be recommenced early in October.

Mosaics in the House of Commons.

In the House of Commons recently Mr. Essex asked the First Commissioner of Works whether the four panels in the Strangers' Lobby, two of which were now filled with mosaics, were originally intended to be all filled in with mosaic decoration; whether there were any cartoons or working drawings in existence intended to provide for the two vacant panels; whether it was intended in the near future to complete the four; and whether the patron saints of Ireland and Scotland are to form the motifs for the remaining designs.

Mr. Harcourt, in reply, said: "I think it most desirable that the two remaining panels should be finished in mosaic, as was always intended; but I fear that the

Photos: W. H. Watts.

DETAIL OF MAIN ENTRANCE.

This new building has been erected by Messrs. Bird and Pippard, of Yeovil, from designs by Messrs. Oatley and Lawrence, architects, of Bristol.

condition of the public finances will not warrant the Government at present in spending money in works of supererogation, however decorative. I may, however, suggest that these panels are very suitable for private generosity on the part of those who are addicted to the missing saints, and I shall be glad to receive any communications in this direction."

Duke of York's School.

Mr. Horniman asked the First Commissioner of Works whether, in case of the sale of the site of the Duke of York's School at Chelsea, means would be taken to reserve at least some portion thereof as an open space, and to retain as many of the large trees as might be possible in the thoroughfares that would be laid out; and whether any plan or scheme had yet been prepared.

Mr. Harcourt replied that no plan or scheme had yet been prepared, and he was not able to make any further statement.

Correspondence.

The Crushing Strength of Concrete.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The article by Mr. T. E. Coleman in your issue for July 22nd is, I think, somewhat misleading as regards the crushing strength of concrete. The crushing strength of good concrete (one cement, two sand, four broken stone) at 28 days will be at least 2,000lbs. per sq. in., whereas Mr. Coleman gives only 350lbs. per sq. in. Again, the increase in strength from 350lbs. at one month to 930lbs. at six months is abnormal, and I can only assume that the tests from which his figures were taken were very unskilfully made, and are therefore of no value for purposes of comparison.

WILLIAM A. T. FLITTON.

Irthlingborough.

To the Editor of THE BUILDERS' JOURNAL

SIR,—The crushing strengths of concrete one month old are based on actual results obtained from personal experience in connection with concrete foundations which were carried to a depth of 40ft. The aggregates available for the purpose consisted of a local limestone, or, as an alternative, broken bricks. Experimental concrete blocks (12in. cubes) were therefore made and tested (after 28 days in air) by actual crushing between pine boards. A series of 20 blocks were made and tested. The crushing strength of concrete consisting of one part Portland cement, one sand, and six broken brick, was found to be about 350lbs. per sq. in., and 320lbs. for concrete with one Portland cement, one sand, and six parts broken local stone. The concrete was made in the usual way, with the ordinary materials available, and under such conditions as would obtain in ordinary contractors' work. No attempt was made to obtain a high and fictitious crushing strength by the adoption of special care in making the test blocks, such as I have frequently seen adopted in making cement briquettes.

With the use of a superior description of aggregate, mixed in the proportions of one cement, two sand, and four parts broken stone, as specified by your correspondent, a much higher laboratory crushing strength could readily be obtained, more especially if the materials are carefully placed in the moulds, and thoroughly well rammed and consolidated in small portions. So far as my own experience goes, however, I am not prepared to accept the figure of 2,000lbs. per sq. in. mentioned by your correspondent as approximately representing the true average crushing strength of ordinary contractors' concrete made with common brick or soft limestone in the proportions which I describe, and tested after 28 days in air.

T. E. COLEMAN.

The Sculptor's Art in England.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—There are some points in regard to the above article in your issue for July 15th about which I am not at all clear.

In "The Beginnings" the writer refers to memorial crosses, "chiefly in Cornwall and in the northern parts of the Kingdom," from which I gather he did not intend to confine his survey only to England, as the heading states. If this is so, surely Ireland has the first claim to "memorial crosses." Then I think it hardly fair to say that the 13th century saw "the culminating point of English sculpture, this being the only period in its history at which a high degree of excellence was obtained by purely natural means . . ." if the writer includes the Renaissance with the Gothic, as it must be borne in mind that both styles originally came from the Continent.

Again, under the heading of "The Decline," I note that the writer includes the

Ground-floor Plan. First-floor Plan.

BAKERY, KING STREET, STANRAER. SALMON AND SON AND GILLESPIE, FF.R.I.B.A., ARCHITECTS.

The plan of this bakery is arranged for speedy packing of the vans in the covered yard with bread for country delivery. The lower internal walls, to a height of 6 ft., are faced with white enamelled bricks and tiles, and the floors are formed of concrete covered with Granolithic. The open-timber roofs are of pine, dressed and stained. The cost of the additions was £1,700. Messrs. Salmon & Son & Gillespie, FF.R.I.B.A., of 53, Bothwell Street, Glasgow, were the architects.

name of Nicholas Stone. The monument referred to in the north transept of Westminster Abbey to George Villiers appears to be confused with that to Sir George Villiers in St. Nicholas Chapel. Nicholas Stone says: "In 1631 I mad a tombe for the Right Honourable Lady the Countes of Bukingham, and sett it up in Westminster Aby, and was payed for it £560." This is the monument to Sir George Villiers in St. Nicholas Chapel. He died in 1605, and the Countess, his second wife, died a year after ordering the monument, namely, in 1632. The Duke of Buckingham, however, was killed in August, 1628, buried in the vault in the September following, and his wife did not die until 1613, after which time, I take it, the monument in Henry VII.'s chapel was erected, but I do not think Nicholas Stone was the sculptor, and the effigies, if they are "bronze statues," as the writer says, would go to prove my theory, for there is no statue in bronze known to be by him.

I think the monument was erected much later—after the death of Stone in 1647.

ALBERT E. BULLOCK, A.R.I.B.A.,
London.

[We agree with Mr. Bullock that in an account of national sculpture (with any pretence to be considered an exhaustive one) the claims of Ireland as represented by numerous finely designed memorial crosses could not well be overlooked, but we adhere to our opinion that the sculptor's art in England was seen at its best towards the end of the 13th century. We are aware that Nicholas Stone was employed for the monument to Sir George Villiers, but, although the available evidence is by no means conclusive, we think it is fair to assume that this sculptor was also responsible for at least the modelling of the bronze statues of the Duke of Buckingham and his wife in the north transept of Westminster Abbey.—Ed. B.J.]

Law Cases.

A MISTAKE IN A CONTRACT. — In the Chancery Division on July 30th judgment was given by Mr. Justice Ross in an action brought by Messrs. Collen Bros. against the County Council of Dublin and others to rectify a deed of the 29th August, 1896, dealing with the contract for the erection of the Portrane Asylum buildings. Mutual mistake was relied on by the plaintiffs. It appeared that the works specified in the bills of quantities were divided into sections and sub-sections. The male and female wards for each separate class of inmate constituted a separate sub-section. The plaintiffs priced the bills of quantities at a total sum of £199,000. The Commissioners being of opinion that the amounts appearing were more than it was advisable to spend on the asylum, directed their quantity surveyor to prepare a bill of reduction. The pricing of the reduced bill brought the aggregate sum down to £169,556. On this basis the tender was made out, with a discount of 1½ per cent., bringing the net sum out at £167,000, and this tender was accepted. It was not until 1900, when the plaintiffs were making up their accounts, that they discovered an error. The price of the male section in the original priced bill of quantities was less than that of the female section. A reference letter in the summary had been misplaced, the effect of which was that there was a difference of £357, which the contractors lost. It had been said that if the plaintiffs made a mistake they must bear the consequences. That was not his Lordship's view of the matter. The intention of the parties, when analysed, was that the tender for the original amount of the priced bill of reduction should be accepted. The sum of £167,000 was erroneously taken to be the total and erroneously embodied in the contract, The primary duty of a court of equity was to enforce fair dealing between man and man, if it could be done without violating some matter of principle. But his lordship was brought face to face in this matter with a technical difficulty which he regretted to say he could not see how the plaintiffs could get over, and that was that they were bound by their tender. Another point was that the plaintiffs' claim was a debt payable out of the poor rate, and must be paid within the half-year within which it was incurred, or within three months after the expiration of such half-year, and not afterwards. The plaintiffs' contended that the meaning of the words "became due" referred to such debts and demands as were recoverable at law, and did not require a declaration in a court of equity. His lordship feared the proposition could not be maintained. The debt was due in equity before the declaration was made. The word "due," he held, implied a debt recoverable by any legal process. It was right to say the section did not seem intended to deal with the case of permanent works continued under the borrowing powers, but he did not see how to escape from the express words used. He knew the plaintiffs were misled by the expectation that their claim could be dealt with by the arbitrator, or that something could be done by the Local Government Board. As his lordship could see no way at present of getting over the difficulty raised by the section, he must with great regret dismiss the action, but under the circumstances without costs. There might be some way of getting over the difficulty. The money was honestly due to the plaintiffs. He suggested to the parties and to the Local Government Board that as soon as notice of appeal had been served they should compromise the matter and give the plaintiffs one half the amount of their claim, thus avoiding the expenditure of more money in litigation. He thougnt that would meet the real justice of the case.

DISPUTE OVER A STRIP OF GROUND 4½INS. WIDE.—At the Gateshead County Court on August 4th his Honour Judge Greenwell heard a case in which the main issue was the ownership of a strip of ground 4½ins. wide and 10ft. 6ins. long, running by a boundary wall between 52 and 54, Cromwell Road, Mount Pleasant, Gateshead. The plaintiff was Mr. H. N. Wood, and the defendant Mr. Isaac Hall, and both parties claimed £10 damages for encroachment, and an injunction ordering the opposite party to remove such part of his outbuilding as was encroaching, being claim and counter-claim respectively. Plaintiff's story was that about ten years ago the existing boundary wall was continued to the west to replace a wooden fence which had up to then formed the boundary line. The builder of the wall received instructions to erect the wall in line with the existing wall, but by some mistake the wall was built 4½ins. within the boundary line on plaintiff's side. Plaintiff knew of that at the time, but did not take any action because he did not anticipate any trouble arising. In May last, however, he decided to replace the wall, and had it built in line with the foundation of the original wall, so counteracting the 4½ins. of ground which he lost ten years ago. Soon afterwards he received a letter from defendant's solicitor, which said he had encroached upon defendant's premises to the extent of 4½ins., which he promptly denied. Defendant in evidence said he had owned the house 52, Cromwell Place since 1895. To his knowledge, no alteration had been made in the boundary line as it then was, and, assuming that the wall was rebuilt about ten years ago, it was not built out of the boundary line. He had never heard of any complaint to the effect that an encroachment had been made on plaintiff's land. On May 9th last he noticed that the wall had been rebuilt, and that it was four and a half inches on his side of the boundary line. His Honour said the parties in the case through bringing it into court would have to spend probably a hundred times as much as the value of the strip of ground in question. Plaintiff had built a wall which disturbed defendant, who had, therefore, threatened him with the law. In consequence, plaintiff himself took action over a piece of land which he had voluntarily given up ten years ago, and probably was never going to mention again if the defendant had let him alone. Was the plaintiff entitled to the land? He was not satisfied that he was. The fact that plaintiff built the wall in the first place, and the fact that he did not protest against the wall having been built so as to encroach upon his land was a great deal stronger evidence than any given as to where the actual boundary line ought to be. In regard to that, it seemed to his Honour that plaintiff's claim failed. On the other hand, defendant's case seemed to fail with equal or even greater completeness. Judgment would be entered for the defendant on the claim, and for the plaintiff on the counter-claim, and each party would pay his own costs.

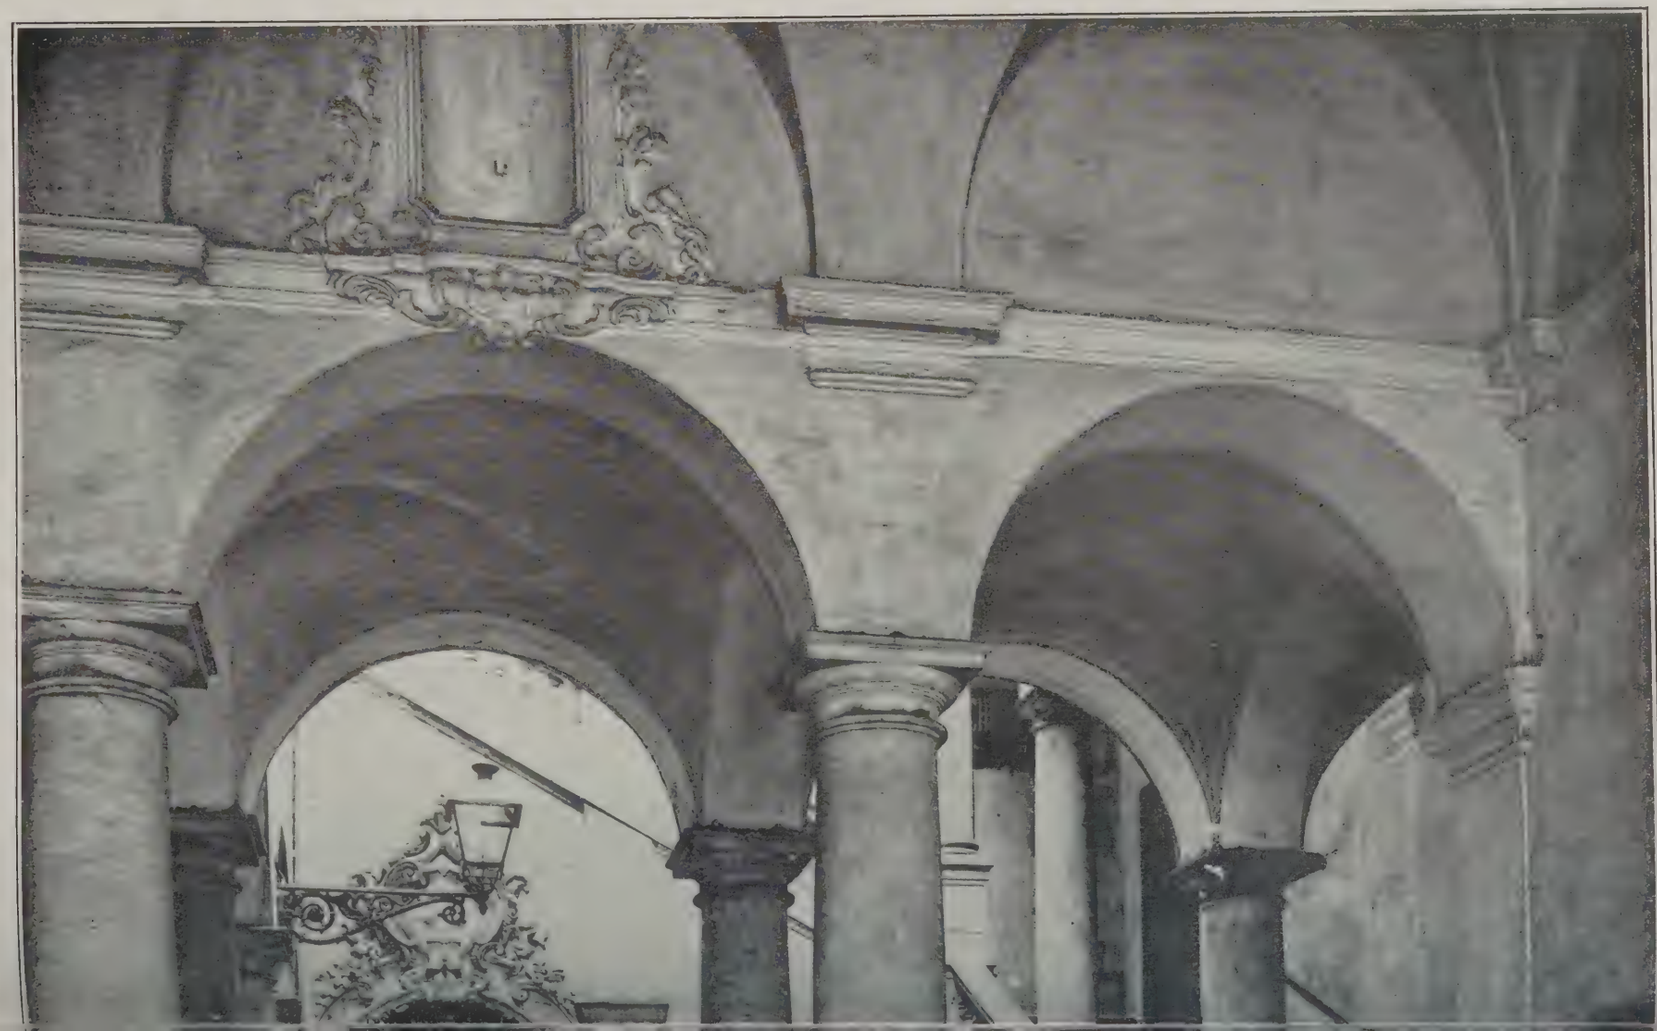
ROYAL COMMISSION ON WELSH MONUMENTS.

The King has appointed a Royal Commission to make an inventory of the ancient and historical monuments and constructions connected with, or illustrative of, the contemporary culture, civilization, and conditions of life of the people in Wales from the earliest times, and to specify those which seem most worthy of preservation. The Commissioners are:—

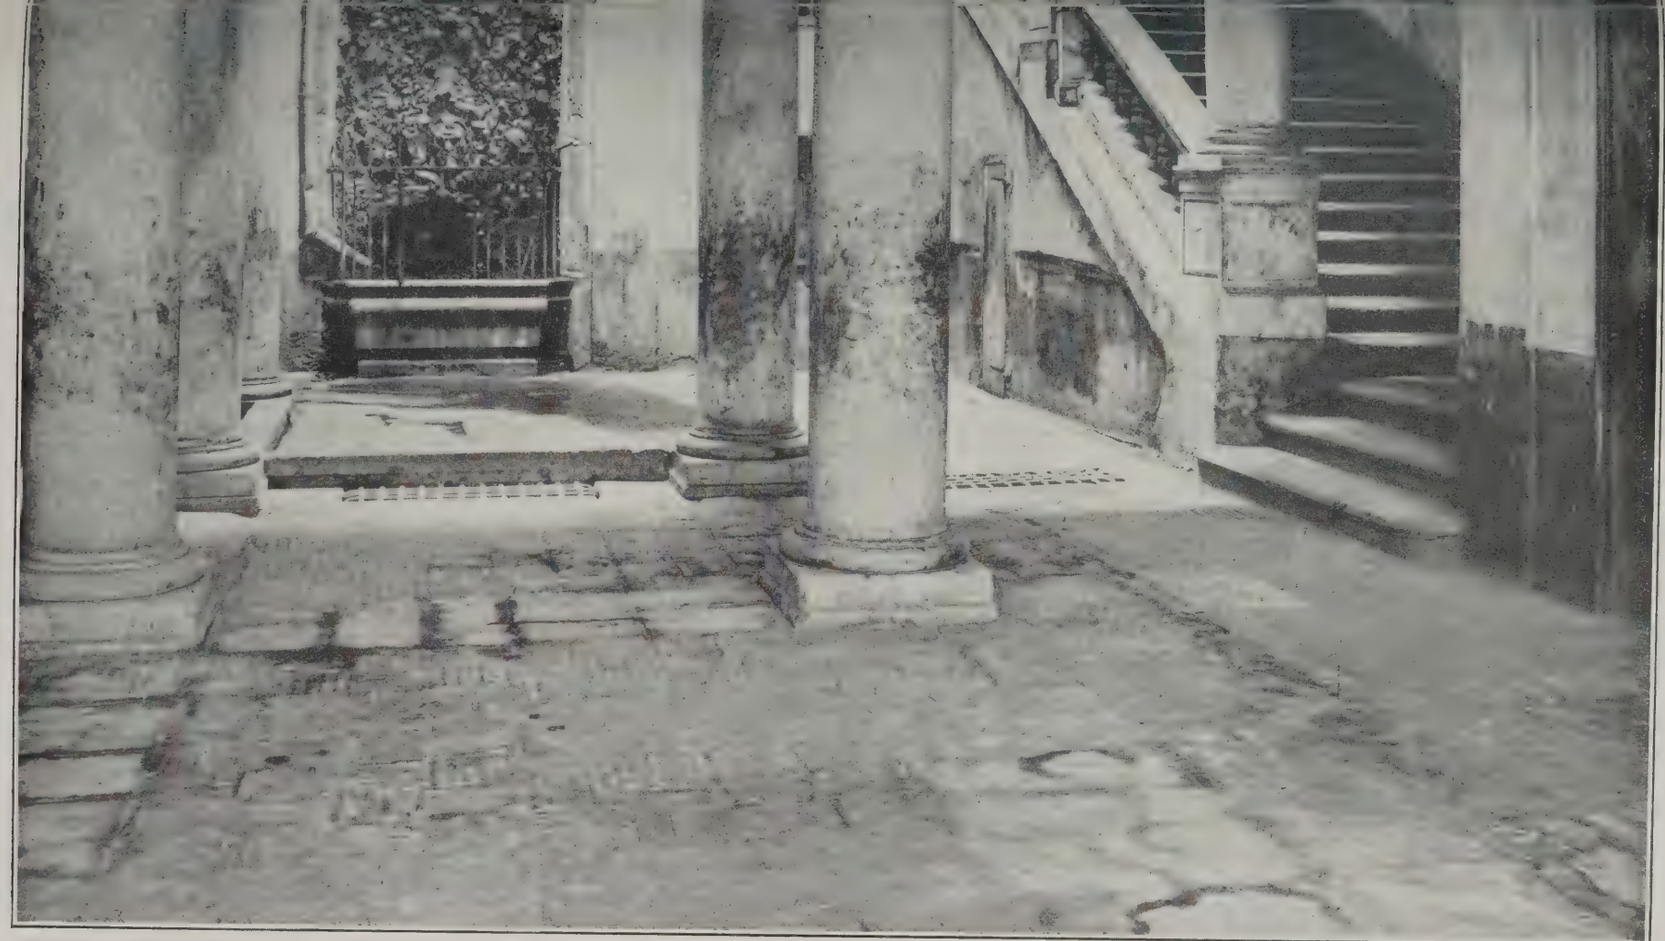
Sir John Rhys, Principal of Jesus College, Oxford, Professor of Celtic in the University of Oxford (chairman).

Professor Anwyl, M.A., Professor of Celtic in the University College of Wales, Aberystwyth.

Professor R. C. Bosanquet, Professor of Classical Archæology in the University of Liverpool.



Mr. E. Vincent Evans, secretary of the Cymrodorion Society.



Alderman Robert Hughes, J.P., president of the Cymrodorion Society.

Rev. Griffith Hartwell Jones, Rector of Nutfield, member of the Cambrian Archæological Association.

Lieutenant-Col. William Llewellyn Morgan, R.E., late of the Ordnance Survey, Treasurer of the Cambrian Archæological Association.

The secretary is Mr. Edward Owen, of the India Office, and the assistant secretary, Mr. Phillip Edward Thomas.

VESTIBULE AND ENTRANCE STAIRS, PIAZZA GIUSTINIANI NO. 7, GENOA.

HUGE NEW LOCK FOR PORTSMOUTH.—essrs. Morrison and Mason, of Polma-e, Glasgow, are the contractors selected the Admiralty for the construction of e new lock at Portsmouth Dockyard, hich is estimated to cost £1,000,000. he lock will be 800ft. long and 120ft. ide.

* * *

"HOUSE MOTTOES AND INSCRIPTIONS: D AND NEW."—A new and revised ition of this book, by Miss S. F. A. ulfield, is to be published imme-ately by Mr. Elliot Stock. It contains collection of mottoes taken from houses many lands and ages, with informa-n on the use of such inscriptions, and eir characteristics among different oples. The volume is illustrated from otographs.

NEW PUBLIC WASHHOUSES AT EDIN-RGH have just been completed. The ildings are situate in Simon Square. ovision is made for 40 washing stalls, gether with hydro-extractors, drying mbers, etc., and a special feature has en made of a large and well-ventilated om where the children can be amused hile their mothers are washing. The rk has been carried out at a cost of out £5,000, from designs by the city chitect, Mr. J. A. Williamson, R.I.B.A.

* * *

THE NEW TOWN HALL AT LANCASTER nearing completion. It is in the cen-of the town, having a frontage to lton Square. The architect was the e Mr. Mountford, whose design is be-g carried out by his partner, Mr. F. Dare pham. The building is constructed of ngridge stone with Darley Dale for the ge columns supporting the pediment e tympanum of which contains sculp-e by Mr. Pomeroy, A.R.A.), and for main cornice. The general stone ving on the building has been exe-ed by Mr. Gilbert Seale, of London, l the wood carving by Messrs. Waring l Gillow, of Lancaster, who are also general contractors. The clerk of works is Mr. Michael Hague, who acted in a similar capacity on the new Sessions House at Preston.

* * *

GALVANISED IRON ROOFING FOR CUBA.—An American consular report says there has been a marked demand during the past year in the Santiago district of Cuba for galvanised corrugated iron roofing. This was due to the activity which has been taking place in building operations, and the fact that this class of roofing is supplanting to a considerable extent the native tile roofing. England supplies practically all the corrugated iron roofing that is sold in this market. The merchants claim that they can purchase a better grade of corrugated iron for less money from British manufacturers than they can from American.

* * *

THE NEW BRIDGE AT SUNDERLAND is expected to be completed by the end of this year. It is being constructed jointly by the North-Eastern Railway Co. and the Sunderland Corporation. The bridge is of double-deck construction, accommodating the railway traffic on the upper deck and vehicular and pedestrian traffic on the lower platform. With its approaches it will have a total length of one and three-quarter miles, and it involves the use of 9,000 tons of steelwork. The contract, put at about £400,000, is being carried out by Sir William Arrol and Company, Ltd., of Glasgow, to the designs and under the inspection of Mr. Charles A. Harrison, of Newcastle-upon-Tyne, the chief engineer of the Northern Division of the North-Eastern Railway.

* * *

MESSRS. EDMOND COIGNET, LTD., of 20, Victoria Street, S.W., have a stand in the French Section of the Machinery Hall at the Franco-British Exhibition. It takes the form of a table—a model of a floor slab, supported by beams and columns, the latter with footings in reinforced concrete. The whole is rendered and finished in Portland cement and sand. The cement used for the concrete and rendering is "Ferrocrete," manufactured by the A.P.C.M., Ltd. On the table are a model Coignet pile (part of which is stripped of concrete, thus showing the method of reinforcement); a sectional model of pipe with spigot joint, part of this model being also stripped showing armouring, and models of the steel framework of the two types of reinforcement or armouring used in beams constructed on the Coignet system. At the back of the table, on a panel, are photographs of various works executed on the Coignet system, among which will be noticed a very extensive tobacco warehouse at Bristol, showing the fine interior effects of reinforced concrete for this class of work.

Our Plate.

Entrance Hall and Stairs to a Genoese Building.

The vestibule and entrance stairs to No. 7, Piazza Giustiniani, Genoa, which we publish as a centre plate this week, is one example out of many of a similar kind to be found in Genoa. In former issues we have given illustrations of work in Genoese palaces — such as the Palazzo Balbi—and here again we see the scholarly character of design which is adopted. The work is well proportioned and well executed, and there is a sturdiness about it which comes as a great relief to much Italian design where columns are used as supports.

Notes on Competitions.

Glamorgan County Offices, Cardiff.

At the suggestion of a large number of intending competitors for this building, the time for sending in designs has been extended to November 1st next. Replies to questions arising out of the conditions have just been isued. From thee we extract the following:—"No perspective drawing is wanted, and if any are sent they will be detached from the plans or pasted over before they are shown to members. . . . It is fully intended by the Council that the adjudicating architect shall be in every respect independent, but as they are not prepared to agree to the terms of competition issued by the Institute, they have not bound themelves to the selection of the adjudicator by the President of the Institute."

A Warrington Improvement Scheme.

On the report of the assessor (Professor C. H. Reilly, of Liverpool), the first premium (£50) for a scheme for the widening of Market Gate, Warrington, has been awarded to Messrs. Wright, Garnett and Wright, an alternative scheme by whom was also placed third. The second place was awarded to Messrs. William and Segar Owen, and the fourth to Mr. Beesley. The competition was a local one, twelve designs being submitted.

New Schools at Sale.

Messrs. Magnall and Littlewoods, of Manchester, are the successful architects in the competition for new Council Schools to be built at Northenden, Sale.

Emergency Hospital, Ilford.

Fifty-four designs were submitted in this competition. The assessor, Mr. H. Percy Adams, F.R.I.B.A. (who took the place of Dr. Green, originally proposed for the position), has made the following award:—1st, Messrs. Armstrong and Wright, of Newcastle-on-Tyne; 2nd, Messrs. Ewen Harper and Brother, of Birmingham; 3rd, Messrs. Chatterton and Couch, of London.

Restoration of St. George's Church, Bolton.

The first premium in this competition has been awarded to Mr. J. L. Simpson, and the second to Mr. F. Freeman—both of Bolton. Mr. Simpson has been appointed architect for the work, which is estimated to cost £7,000. Messrs. Austin and Paley, of Lancaster, assessed the designs submitted.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Aug. 31	PARISH CHURCH AT BISHOPS-WEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Road, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Nov. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
No date.	SITE-PLAN FOR COTTAGE EXHIBITION, SWANSEA, 1909. Gold, silver, and bronze medals, together with sums of £20, £15, and £10. Particulars from Henry R. Aldridge, Secretary to Exhibition, 7, Gower Street, Swansea.
No date.	COUNCIL CHAMBERS AT BELLSHILL, BOTHWELL. To cost £2,000. Site plan and conditions from Robert Anderson, Parish Council Offices Bellshill. Deposit one guinea.

Trade and Craft.

Messrs. Peters' Specialities.

There is no better evidence of increasing progress in the history of a firm than the necessity for taking larger premises, and Messrs. C. A. Peters, Ltd., of Derby, whose London office was housed in somewhat cramped quarters at 68, Queen Street, Cheapside, have now moved to commodious premises at 116, Newgate Street, E.C. Their new telephone number is 1105 Holborn; but the telegraphic address remains the same: "Carbotron, London." The word "Carbotron" brings us at once to one of the most interesting of Messrs. Peters' specialities "Carbotron" portable stoves. These are not new—they have enjoyed a steady sale for the past 20 years—but recently the demand has very greatly increased, the stove being proclaimed an ideal one for motor houses and garages, and for this purpose it is approved and recommended by all the fire insurance offices. The reason for this is that these stoves burn without smoke, flame, or fumes. It need hardly be added that "Carbotron" is a proprietary fuel, being, in fact, a special chemical compound, and as there is no flame there is no danger of igniting petrol vapour and causing explosions. "Carbotron" developes great heat, burns without smell, and is economical in use, the stoves only requiring attention once every 12 hours or so. For entrance halls, corridors, offices, shops, greenhouses, coach-houses, and lavatories, they are invaluable; and requiring no flue pipes or chimney flue, they are handy for use anywhere. The prices range from 18s. upward. Another speciality, "Carbolineum Avenarius," the wood preservative, hardly requires any mention from us, being known and used the world over. But it may be interesting to mention that this reservative gives a very fine brown stain to the timber, which when sized and varnished, gives a good interior finish. Carbolineum is also used for damp walls, ropes, and boots and shoes. A more powerful preservative, "Sotor," is employed on timber subject to the action of sea water, and for resisting the attacks of the Teredo Navalis. Prism Antioxide is another speciality for preserving metal-work from rust and for preserving paint, and can be applied as a waterproof solution over advertisement bills, wood treated with Carbolineum, as well as iron-work. Messrs. Peters also make indestructible combination washers for the flange joints of steam and water pipes. They consist of rings of soft metal, grooved outside, and holding in the groove packing material, such as asbestos, rubber, hemp, etc. The soft metal in conjunction with the packing readily adapts itself to any unevenness in unplaned flanges. One of the most recent things Messrs. Peters have placed on the market is their "Okin-Vash" paint cleaner. This is a colourless liquid which is applied with a sponge to the painted surface. The paint-work is then washed and rubbed down with another sponge and cold water. From personal experience of this cleaner we can say that it is most effectual, and the proprietors guarantee it to be quite harmless to the paint itself. Messrs. Peters have a number of other ingenious things in household and culinary labour-saving appliances, which will certainly appeal to householders who can visit the showroom at 116, Newgate Street, where Mr. Rycroft Spence, the courteous London manager, will be pleased to see them.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Secondary Schools.

WHITBY.—STREONSALT writes: "Please recommend a good cheap work on secondary schools. Have you published any plans of such schools?"

There is no "good cheap work" on secondary schools; in fact, there is no book at all dealing exclusively with such schools. The best book in which reference is made to them is Mr. Felix Clay's "Modern School Buildings," price 25s. nett. In January last the Board of Education published a series of building regulations for secondary schools, which can be obtained, price 2d. (by post 2½d.) from Messrs. Wyman and Sons, Ltd., 109, Fetter Lane, London, E.C. The regulations for classrooms were given in our issue for February 5th last. On p. 75 of our issue for January 22nd you will find a list of secondary schools recently published in our columns, and on p. 343 of the issue for April 15th is a useful reply in regard to the cost of secondary schools.

Pipes for Heating.

GLOUCESTER.—AJAX writes: "Are there any pipes about 9in diameter that will stand excessive heat? They are wanted for the drying of wheat and other grain. The furnace will be built with firebrick, and we may have to get enforced draught with a fan."

The best pipes for your purpose will be of wrought iron plate, ½in. thick, riveted together, and made by a boiler-smith or bridge builder. You may find it necessary to line the pipe with fireclay tubes, which should be at least ¾in. thick, and it will be better to make the tubes thicker near the furnace, to equalise the heat of the outside of the iron pipe along its length. If the pipes be laid to rise towards the chimney, and the chimney be made the same area as the pipes, and plumb inside all the way to the top, you should not need enforced draught. If you can rely on the fireclay lining being repaired and renewed, you may be able to use lighter pipes—say, ordinary lap-welded, as made by any good boiler-tube works; or special half-rounds, pressed together, which can be obtained through an iron merchant. But if you cannot rely on this daily inspection and regular expense, you will need best boiler plate, riveted with a butt strap, and made in a boiler shop, bridge shed, or shipyard.

INGENIOR.

Roof Queries.

ASHTON.—F. J. A. writes: (1) "When referring to text-books in order to calculate sizes of padstones, the length and breadth are always given, but not the thickness. Is this assumed to be 12ins. thick? (2) I have found it useful to carry wood joists on the lower flange of a girder instead of on the top, but cannot trace any given example showing whether the girder ought to be increased in size or not. What difference does it make if the joists are carried in this way instead of on the top of the girder? (3) What weight should be allowed for an ordinary roof, including wind-pressure, etc.? (4) I have had trouble with tile roofs. I find the tiles are nailed at only every fifth course. The tiler says this is usual, and that nailing every course is unnecessary. What is your opinion?"

(1) The thickness of padstones is fixed by judgment only; there is no general rule, but one-third of the length would in general be a fair proportion for the thickness. (2) Floor joists may usually be carried on the bottom flange of a girder without any increase in the size of the girder being necessary. (3) A gross load of 50lbs. per ft. super. on the sloping surfaces of a roof is usually sufficient, but there are many cases where it is desirable to take the dead load and wind separately—say, 27lbs. per ft. super. over the whole roof for dead load, and 28lbs. per ft. super. on the side only normal to the roof surface for the wind. (4) Tiles are usually hung by pegs, or nibs, every fourth course being nailed in addition.

HENRY ADAMS.

A Building Line Question.

LONG EATON.—F.S. writes: "I have deposited plans, etc. of four cottages and a shop with the Council for their approval, but they are holding the matter back on account of the building line. I intend to build up to the front, but the Council say they require me to set it back 6ft. I should be glad to have your opinion." Sketch sent (not reproduced).

As all the adjoining property appears, from your sketch plan, to be built up to the front, I fail to see on what grounds the council ask for your particular property to be set back. If, however, there are any buildings in the road to the north-west or to the south-west of your building plot, and these buildings are so set back, the council have powers to require you to set back to the same lines (Public Health Act, 1888, section 3). I am of opinion that if this is not the case, the council cannot compel you to set back.

F.S.I.

Work Done by Official in Leisure Time.

LEGITIMUS JUSTUS writes: "Is it legal for a person employed in a public office such as a district or urban council office as a surveyor's assistant to survey and to prepare drawings for proposed new buildings, drainage, or any other work in his leisure time, and to put them before his own council for approval?"

Every such case must stand upon its own merits. As a rule, it is well to avoid any such complications as may arise in the circumstances which you detail. There is, however, nothing in law or custom to hinder a surveyor or his assistant from preparing plans for submission to his own council.

F.S.I.

Obituary.

MR. JAMES SHEPPARD.—We regret to announce the death of Mr. James Sheppard, aged 68. By profession he was an insurance surveyor, acting for the North British and Mercantile Insurance Co. but, both professionally and privately, he extended the scope of his work far beyond the limits of that vocation, and was recognised as an authority on all constructional questions where fire protection was concerned. For ten years he was a member of the Executive of the British Fire Prevention Committee, and was most actively associated with the testing operations of the committee, having been the directing member of no fewer than 40 tests in respect of which reports have been issued. He was a member of the Council of the London Insurance Institute, and personally enjoyed quite exceptional popularity.

CONCRETE AND STEEL SECTION.

(MONTHLY).

Free Lime in Cement.

During recent years there has been a very great advance in the manufacture of Portland Cement. This is attributable to many causes, the chief of which are probably the gradual extension of the system of having tests made in regard to the quality of the cement by independent specialists; the greater appreciation by engineers of the requirements for making good concrete, and the influence of fine grinding; and, finally, the coming of reinforced concrete. These have resulted in a gradual increase in the stringency of specifications. Engineers have not rested satisfied, but have asked for a continual improvement in the strength and quality of cement. The placing of the testing in the hands of specialists who have standardised methods, has required the manufacturer to discard his old rule-of-thumb ways and to employ competent chemists to supervise the manufacture of Portland cement in every stage. In the early days of Portland cement manufacture there was risk of considerable quantities of free lime being present in the materials, due to the irregularity of proportioning and mixing and of the burning in the early type of chamber kiln, the effect of the latter being often to permit underburnt clinker to be ground up into the cement. This free lime and the presence of underburnt clinker caused the material to undergo considerable expansion in setting as well as frequently causing the work to be unsound. The special tests designed to ensure constancy of volume, *i.e.*, to eliminate expansion, were therefore gradually increased in severity, and the manufacturer was pressed to effect improvements in this direction. At the same time the influence of fine grinding set off in part the deleterious results due to the presence of free lime, especially when the cement was stored in thin layers so as to allow air slaking to take place—a general requirement in the early days that was the outcome of the presence of free lime due to underburnt clinker. The proportions of the materials entering into cement are ruled by chemical reactions, and therefore they are fairly settled, but, to produce a good cement, the materials require to be thoroughly vitrified at a high temperature in order to eliminate the presence of free lime. In the early days of manufacture, although the proportions of the lime might be chemically accurate enough to secure a proper cement, yet the silicates and aluminates if lime had not been formed by the reactions that required high temperatures, and consequently the lime present was quick, of the nature known as "free."

A good deal of cement continues to be manufactured in chamber kilns, and these have been improved, as also the methods of manufacture, so that a much better quality of cement is produced with them than was formerly the case; indeed, it is only necessary to exercise great care in the rejection of underburnt clinker to obtain good-quality cement from the earliest kilns. However, the last few years have seen a considerable change in the process of manufacture, for the rotary kiln, which had been experimented with for many years, has at last been brought to a state of perfection, and many cement manufacturers have adopted it because it economises in manufacture as well as secures a better quality of cement. Underburnt clinker can of course be produced in the rotary kiln, but with ordinary care an almost perfect product results—that is to say, the vitrification of the materials is such as to combine the whole of the ingredients and leave no free lime present. The clinker obtained from such rotary kilns is very different from that from chamber kilns, being in small nodules, not in lumps. The quality of the cement to-day is measurably superior therefore to the early cement; yet we hear complaints, and it is the purpose of this note to draw attention to certain characteristics which we think require careful investigation.

The Chatelier test for constancy of volume was of considerable value at one time, but too much importance has been attached to it. With the idea of practically eliminating expansion altogether, manufacturers have decreased the quantity of lime and have increased the quantity of alumina in the cement. A small proportion of free lime in cement may be present without material disadvantage, for many classes of work, particularly in building construction, for the adoption of reinforced concrete work has made it a more general custom to employ mechanical mixers and to use the concrete fairly wet, which are safeguards additional to that of fine grinding, because in this way the cement is more thoroughly incorporated throughout the mass, and the water penetrates into every part. Furthermore, the fineness of grinding means that any free lime particles are more intimately mixed throughout the cement. It has been the custom for a long time to depend upon tensile tests to ascertain the strength of cement, but these are practically of no value. We do not require Portland cement to develop great tensile strength; in almost all cases it is called upon to develop compressive resistance. Manufacturers have been making their cement to conform to tensile tests, which are entirely opposed to practice. They should have discarded tensile tests altogether, rather than take the opposite view, as they have done. If they had watched closely the results of tests upon the compressive strength of their cements, they would have been able to greatly improve the quality of the cement for practical purposes far better than they have been able to do by elaborate work in other directions. A cement that has a proportion of alumina which is so great as to cause us to call it overclayed, may develop a high tensile resistance, but it will be deficient in regard to compressive resistance. Therefore, briquettes in a tensile testing machine may show good results, and tests as regards expansion by the Chatelier method may be excellent, but the cement may after all be very inferior. Even if a certain amount of expansion in the setting of Portland cement is residual, the means which go to counteract it, such as fine grinding, thorough mixing, and well wetting, will be taken up by the voids present in the concrete, but if the cement errs on the side of entire elimination of expansion, or indeed contraction, certain effects result which may be very harmful in practice.

Architects and engineers were at one time much frightened at the possibility of concrete floors expanding and pushing the walls out, and we sometimes find in old specifications a requirement for a space to be left between the edges of a concrete floor and the walls to allow this expansion to take place. Though such expansion may have occurred in a few instances with very bad cement, and so may have led to these requirements being stipulated, as a general rule nothing of the sort ever took place, and enormous areas of floors have been constructed without any provision in this respect, and no expansion has been noticeable. Thus manufacturers have been engaged in pursuing a shadow in trying to eliminate expansion, for the results in practice are not so harmful as they have been supposed. They have now gone too far, and we have lately heard of instances where overclayed cement was used for the construction of concrete floors, of contraction taking place in the setting, which drew the floor slabs away from the supports and caused cracks; obviously this is very detrimental. We think, too, that many minor troubles that have occurred in connection with the cracking of concrete floors might be traced to this overclaying, if we may so call it, of the cement, and the elimination of expansion. There are other aspects, also, of the results of contraction in concrete which may here be set forth, to be borne in mind by manufacturers.

In reinforced concrete work, steel is, as a rule, introduced for the purpose of taking tension, but it is also often introduced to reinforce the concrete in the resisting of compressive stresses—as, for instance, in columns, posts or pillars. The vertical rods in such structural members are embedded sufficiently far within the concrete to feel the full effects of any contraction that may occur. This will put an internal compressive stress in the steel that may be considerable, so that in building a column under such conditions on ordinary theory, we may have the steel over-stressed, to counteract which we ought in designing it to resist any specific load to increase its amount, which, of course, is not in the direction of economy. The same thing applies to the construction of reinforced concrete arches. In some few tests that have been conducted upon reinforced concrete beams it has been surprising to note that practically no deflection has taken place in the first stages of loading. An explanation of this, it has been suggested, may be found in the contraction of the concrete, which would introduce compression into the steel that would have to be neutralised by the application of loads before deflection under the tensile stresses thereby induced would become evident.

We have before referred in these columns to the very great importance of temperature stresses in concrete, but of almost equal importance is many cases

are the stresses induced by the contraction of the concrete dependent upon the setting qualities of the cement. Cracks that become evident, and result in material loss in the construction of tanks, reservoirs, etc., are no doubt often partly or wholly attributable to contraction in the setting, but few authorities have recognised the importance of such influences We urge the importance of thorough investigation into the chemistry of Portland cement manufacture in regard to the practical aspects which we have touched on above.

MODERN PRACTICE IN TALL CHIMNEY CONSTRUCTION. III.

By Hector St. G. Robinson.

Steel Chimneys.

In many places, notably in steelworks, steel plate chimneys are preferred to brick. The advantages claimed are greater strength and safety, smaller space required, immunity against lightning, smaller initial cost, and avoidance of infiltration of air, and consequent checking of the draught—a defect common in brick chimneys. On the other hand, steel chimneys have a shorter life, and are expensive to maintain, inasmuch as they require painting at least every three years. As a rule they are anything but pleasing structures, and architects will no doubt agree with the writer that, as chimneys must of necessity constantly meet the public gaze, it is little short of a crime to make them standing embodiments of innate ugliness. This type of chimney is usually cylindrical in shape, the bottom courses of plates being splayed out to increase the stability. The steel shell is generally secured to a heavy cast-iron ring, which in turn is carried by a brick or concrete foundation by means of long bolts and anchor plates, no guys being used.

In small stacks four or more steel guys are sometimes employed attached to the shell at about two-thirds of the height, and anchored to blocks of concrete, or other suitable objects. This method of support is, however, unsuitable for large or even moderate-sized chimneys.

Steel chimneys are usually provided with a thin lining of firebrick carried to the full height, and independent of the shell. In some modern examples, however, this form of construction has been departed from, the upper portion of the lining being carried by the shell. This method was employed in the four large steel chimneys erected last year at the Long Island City Power Station of the Pennsylvania Railway Company. These chimneys are 275ft. high, and 16ft. in diameter at the top. The lining is self-supporting for a height of 96ft. above the base, above which point it is only 4½in. thick, and supported by Zed bars rivetted to the shell, a space being allowed between each section of the firebrick and the underside of the Zed bars to allow for expansion.

The determination of the thickness of the plates forming the shell is simple. It is usually assumed that the steel will resist the wind moment PL.

Initial compression will exist, due to the weight of the shell and any material supported thereon.

Calling W the weight of shell.

„ A the area of section $= \frac{\pi}{4}(D^2-d^2)$.

„ Z the section modulus of an annular section, having D and d for outside and inside diameter respectively—

$$= \frac{\pi}{32}\left(\frac{D^4-d^4}{D}\right) = .0982\left(\frac{D^4-d^4}{D}\right)$$

A number of values are given in Table B.

The unit stress in the steel shell

$$= \frac{W}{A} \mp \frac{PL}{Z}$$

TABLE B.

Values of section modulus of thin annular sections by the formula $Z = .0982\left(\frac{D^4-d^4}{D}\right)$ in inch units.

Inside dia. inches.	THICKNESS OF PLATE. ¼in.	5/16in.	⅜in.	7/16in.	½in.
48	454·8	568·8	682·8	798·0	913·2
60	711·6	888·0	1068·0	1248·0	1428·0
72	1020·0	1284·0	1536·0	1788·0	2052·0
84	1392·0	1740·0	2088·0	2436.0	2784·0
96	1812·0	2268·0	2724·0	3180·0	3636·0
108	2291·0	2868·0	3444·0	4020·0	4496·0
120	2832·0	3540·0	4248·0	4968·0	5676·0
132	3432·0	4284·0	5148·0	6012·0	6864·0

This formula would give accurate results if the shell were in one plate without joints, but as the strength of riveted joints is much less than the solid plate, it follows that the efficiency of the horizontal circumferential joints will regulate the strength of the structure. The efficiency of single riveted lap joints of the usual proportions in plates up to ½in thick, with punched holes, is about 50 per cent. of the solid plate, double riveted lap joints being about 60 per cent. If in calculating a chimney shell by the foregoing formula a factor of safety of 8 is obtained, it will be readily seen that with single riveted joints the actual factor of safety will be but 4.

The material of which the plates are made should be mild steel, having an ultimate strength of 55,000 to 64,000lbs. per sq. in. This quality of steel is what is known as "flange steel," or "boiler steel." There is a cheaper grade of steel plates on the market known as "tank steel." This latter material, however, is most unreliable, and is apt to be hard and brittle, therefore it should never be allowed in any part of the structure.

In constructing steel chimneys it is usual to arrange the rings telescopically, tapering, of course, towards the top. It is very desirable to caulk the upper edge of all plates, otherwise moisture will readily find its way between the plates, and violent corrosion would result. This corrosion, once commenced, is exceedingly difficult to arrest, owing to the impossibility of reaching the seat of the trouble with paint. All caulking edges should be bevelled in a plate edge planing machine, and the caulking should always be done with a round-nosed tool. If a square-nosed tool is used it creases the inner plate, and if this should prove to be of brittle steel it might cause a failure along this line. Lap joints are almost universal in steel chimneys, but joints with cover straps have been used in very high-class work. The increase in efficiency owing to this joint is very little, probably not more than 10 per cent., and as the cost of the work is increased at least 25 per cent., they are seldom used.

The lower shell plates are usually double riveted in the circumferential joints, with single riveting in the upper rings: the vertical joints are of ample strength if single riveted. The proportions of diameters and pitch of rivets to thickness of plate are given on the following table:—

TABLE C.

RIVETED JOINTS OF CHIMNEYS.

	Thickness of Plate.	Diameter of Rivets.	Pitch of Rivets. Centre to Centre.	Distance between Pitch Lines.	Distance of Pitch Line from edge of Plate.	Percentage of total Strength of plate developed punched holes.
Single Riveted Lap Joint	¼"	⅝"	1⅝"		1"	50
	5/16"	⅝"	1¾"		1⅛"	
Double Riveted Lap Joint	5/16"	⅝"	2⅝"	2⅛"	1⅛"	60
	⅜"	¾"	2⅝"	2⅛"	1¼"	
	⅜"	¾"	2¾"	2¼"	1⅜"	
	7/16"	⅞"	2⅞"	2⅜"	1½"	
	½"					

Fig. 7 represents a typical design for a steel chimney. A large number of such chimneys have been constructed, and are in satisfactory operation in America. Table D gives the principal dimensions of 24 sizes of this type, varying from 2ft. 6ins. to 11ft. inside diameter, and from 70 to 300ft. in height. In all cases the steel shell is in four thicknesses, each thickness being carried about one-quarter of the height, or as near as a standard width of plate will allow, the basis of calculation being a uniform wind-pressure of 50lbs. per sq. ft. Each stack has three openings in the shell, one boiler flue on each side and one soot door, this latter being 3ft. by 4ft. in each case. These openings should be reinforced with compensating rings of heavy angle bar. In many cases, however, the flues are

* *The dimensions indicated by letters are shown on Fig. 7.*

introduced through the foundation. Around the top is placed an angle bar ring, to which is bolted a cast-iron cap, this cap, together with the heavy cast-iron base plate, being cast in segments and bolted together. Ornamental caps, as on the chimney illustrated, are best made of copper, as they are then lighter, and do not rust away as quickly as steel caps would, but, owing to expense, copper is seldom used. A ladder is usually placed outside this class of lined chimney in all cases when the height exceeds about 80ft., these ladders being carried to the full height of the chimney, and out over the ornamental cap, the sides being either of flat bar or steam barrel, placed 18ins. apart, the rungs being of round bars, generally at 12in. centres.

As these chimneys are usually painted from a swinging cradle, it is necessary to provide some means of attaching this near the top. A Zed bar ring with one flange rivetted to the shell immediately under the top ornament is usually all the provision that is required; a trolley can readily be run round on this Zed.

The number and diameter of the foundation bolts, together with size of foundation, are given in the table. These bolts are carried through the foundation to within a few inches of the underside. The foundations have been calculated on the assumption that the ground is fairly firm. Steel or iron chimneys are never protected against lightning by rods or otherwise, as the metal in the chimney and the bolts running down deep in the foundation are generally considered sufficient protection.

Reinforced Concrete Chimneys.

Concrete chimneys have received considerable attention of late owing to the introduction of reinforced concrete. Plain concrete has, however, been used for chimney construction for a number of years. As long ago as 1873 the River Wear Commissioners erected such a chimney at their chain-testing works at the South Dock, Sunderland, the concrete being mixed in the proportion of 1 part Portland cement to 5 of gravel, and the method of construction adopted being similar to the present method of constructing reinforced concrete chimneys.

The advocates of reinforced concrete claim that this material is the best yet introduced for chimney construction, as it embodies most of the advantages of both brick and steel plate construction without their disadvantages. Despite these facts, however, numerous failures of a more or less serious nature have occurred, principally in America, where a large number of chimneys of this class have been built. These failures can in most cases be directly traced to faulty materials or workmanship, and do not therefore constitute an argument against the adoption of reinforced concrete; at the same time they call attention to the necessity for expert supervision in construction.

To architects who are accustomed to the thick walls of brick chimneys the slender proportions of the reinforced concrete type must appear startling. The relative factor of safety, however, is generally higher in the latter. The usual form of construction in this class of chimney is as follows:—

The shell is usually made of two thicknesses only, the lower, or first thickness, extending up to about one-third the height. This bottom portion is protected from the hot gases by a concrete lining with a ventilated air-space behind. The inside shell is usually reinforced with vertical steel to resist the tensile stresses, and to assist in resisting the compressive stresses due to wind-pressure, steel hoops being introduced to stiffen the vertical steel, and prevent thermal cracks induced by the difference in temperature inside and outside the shell.

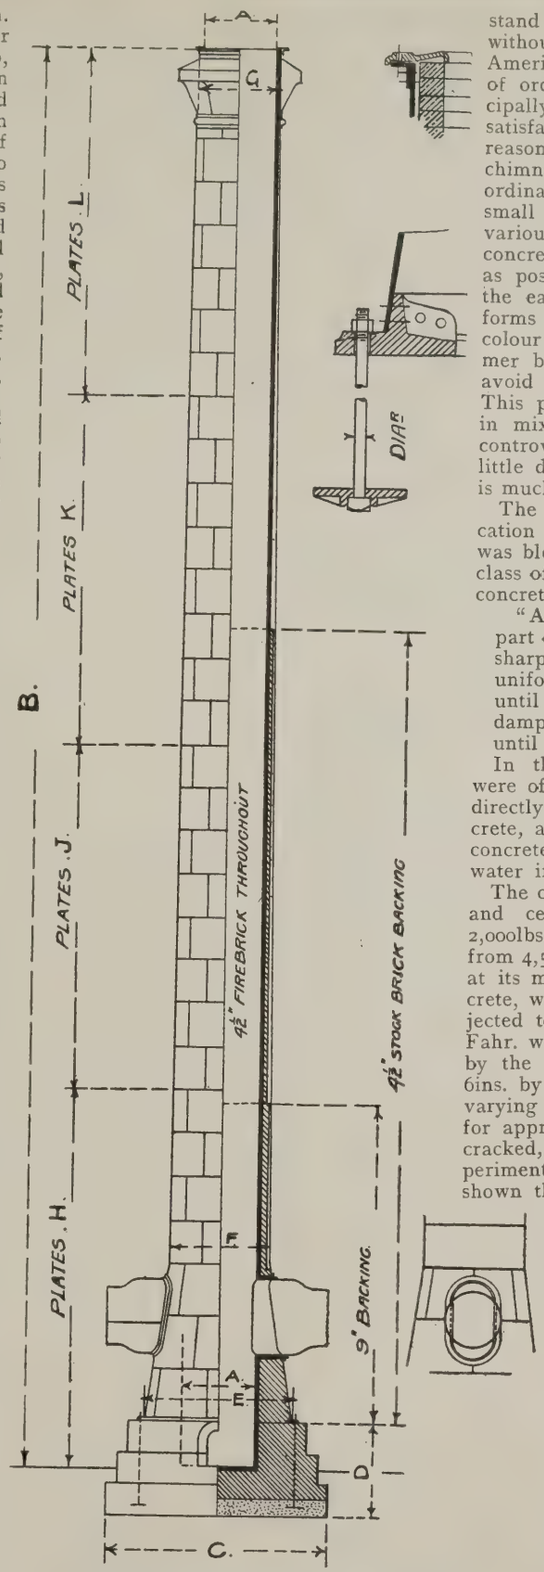

FIG. 7.—TYPICAL DESIGN FOR STEEL CHIMNEY.

The concrete is usually a sand mortar—not a true concrete—3 parts of sand to 1 of Portland cement being the most common mixture, the principal reason for using such a concrete being that it will stand a comparatively high temperature without injury. Quite a number of American chimneys have been constructed of ordinary mixtures of concrete—principally on the Ransome system—with satisfactory results, and the writer sees no reason why the outside shell of a concrete chimney should not be constructed of ordinary concrete if the aggregate be small and sufficient care is exercised. For various reasons it is the custom to mix concrete for chimneys with as little water as possible, the two chief reasons being the ease and rapidity with which the forms can be raised, and the uniform colour of the resulting surface, the former being important in attempting to avoid horizontal planes of separation. This practice of using insufficient water in mixing is a point over which much controversy has taken place, but there is little doubt that a "dry." mixed concrete is much inferior to a "wet" mixture.

The following extract from the specification of an American chimney, which was blown down in a gale, will show the class of concrete often used for reinforced concrete chimneys:—

> "All concrete to be composed of 1 part of Portland cement to 3 parts clean sharp river sand, mixed dry until of a uniform colour, and then moistened until the mixture has a consistency of damp clay; this mixture to be rammed until the water appears at the top."

In this case, although the materials were of excellent quality, the failure was directly traced to the weak porous concrete, and to the lack of adhesion of the concrete to the steel due to insufficient water in mixing.

The crushing strength of a 3 to 1 sand and cement concrete should be about 2,000lbs. per sq. in. in seven days, and from 4,500 to 5,000lbs. when it has arrived at its maximum strength. Such a concrete, when one month old, has been subjected to a temperature up to 600 degs. Fahr. without injury, but a test conducted by the writer on a specimen 6ins. by 6ins. by 4ins., subjected to a temperature varying between 800 and 850 degs. Fahr. for approximately 90 hours, was slightly cracked, but otherwise uninjured. Experiments at Watertown Arsenal have shown that a temperature of about 1,500 degs. Fahr. continued for a few hours is sufficient to draw out the water of crystallisation and destroy the strength of the concrete for a depth of from ½in. to 1in. While much remains to be learned as to the effect of high temperatures on concrete, the writer is of opinion that for temperatures of over 800 degs. Fahr. a lining of refractory material should be used in place of the usual concrete one. As has already been pointed out, however, the temperature of the gases from boilers seldom exceeds 600 degs. Fahr.

Plain rods and bars are often used for reinforcement, sometimes in the form of T bars, but it occurs to the writer that the slight saving in cost effected by the use of plain bars or round rods over the use of bars giving an effective mechanical bond is a very high price to pay for the risk dependent on their use.

The method of determining the resistance moment of an annular section of concrete reinforced with steel is rather complex, the process being lengthy and cumbersome, and more of academic than

general interest, therefore nothing further than the final deductions of the various authorities will be given.

Most attempts that have been made to analyse the stresses in a reinforced concrete chimney shell involve the tacit assumption that a vertical chimney resists horizontal forces in exactly the same way that a cantilever beam resists vertical loading. As is well known, tensile stress will not exist in a circular chimney until the resultant of the forces falls beyond a point one-quarter of the diameter from the outside of the section. This is perfectly general, and applies to any class of chimney. An assumption that allows tension to exist on the windward side from the very commencement of wind-pressure is obviously inaccurate.

Taking the case in which the weight of the shell is such that the resultant is inside of the point mentioned above, it will be seen that the concrete and steel share in the stress proportionately to their compressive moduli of elasticities. The section is therefore a symmetrical one as regards resistance to the bending moment imposed by the wind-pressure.

Call M the bending moment due to wind-pressure in in.-lbs.
R the mean radius of the concrete shell.
fc the compressive stress in the concrete.
C the thickness of the concrete ring.
S the thickness of a steel shell of the area and to the same diameter as the mean diameter of the reinforcing bars.

and M the $\frac{\text{E for steel}}{\text{E for concrete}}$ = say 15.

then $M = fc\,\pi\,R^2c\left(1 + m\frac{S}{C}\right)$

Reinforced concrete chimneys are generally of such a small size at their base that the resultant of the forces will pass outside the section altogether. The foregoing formula will, therefore, have a limited application. If, however, it is assumed that the concrete is capable of resisting tension, the section would still be a symmetrical one, and the scope of the formula would be further extended. It has been pointed out in an interesting article by Messrs. Taylor, Glenday, and Faber, in "Engineering," that in a reinforced concrete chimney the method of calculating the stresses due to bending moment, and those due to weight separately will give incorrect results. After a lengthy theoretical discussion on the matter, these writers evolved the accompanying convenient formulæ for ascertaining the thickness of concrete, and the area of steel required for a large variety of conditions —

In which M is the moment in in. = lbs. due to the wind-pressure above the section.
W is the weight in lbs. of the chimney shell above the section.
R is the mean radius of the shell.
$\frac{Es}{Ec}$ is taken as 15.

These simple formulæ are based on sound theoretical reasoning, which is probably the most successful attempt yet made to rationally analyse the stresses in an annular reinforced concrete section subjected to direct compression combined with bending.

Another method of arriving at the dimensions of a reinforced concrete chimney was devised by Carl Weber, and is still used by the Weber Companies. Apart from its scientific value, this formula has in its favour the fact that it has been used for finding the dimensions of numerous very successful chimneys.

If M = bending moment due to wind *foot* pounds.
D = external diameter and d = internal diameter in feet.
W = weight of chimney in lbs.
A = area of section of chimney in sq. ft., which section resists.
S = area of steel required.
fs = maximum tensile stress in steel due to bending, etc., lbs. per sq. ft.
fc = maximum compression in concrete lbs. per sq. ft.
B = bending moment which section resists.

then

$$B = M - W\frac{D}{8}\left\{1 - \left(\frac{d}{D}\right)^2\right\}$$

$$fs = B\frac{32D}{D^4 - d^4} - \frac{W}{A}$$

$$S = \frac{A\,fs}{\text{Stress allowed in steel}}$$

$$fc = \frac{\frac{W}{A}}{\frac{2}{} + 125} + fs$$

The Weber Company allow a compressive stress in the concrete of 600lbs. per sq. in., and a tensile stress in the steel reinforcement of 16,000lbs. per sq. in.

The weakening effect of the flue openings in the shell of the chimney must be considerable, despite the many ingenious attempts to overcome this, and it is a point in the design that requires careful consideration.

The inside lining has, in addition to supporting its own weight, to resist the thermal stresses induced by the great difference of temperature on the two sides. As the expansion and contraction is not restricted, a few vertical rods are all that are required. The load per sq. in. on the foot of a concrete column of uniform cross-section is about one lb. per ft. of height. For a lining 80 ft. high the stress at the base induced by its own weight would therefore be only 80lbs. per sq. in. Four inches is a very usual thickness for a concrete lining, and for constructional reasons it should not be less. Reinforced concrete chimneys are usually built in lifts of 3ft., two sets of forms being used. If a very good finish is required, they are metal lined. In the single shell the rate of progress is often two 3ft. lifts per day when a "dry" mixture of concrete is used. The scaffolding is built up inside in a similar manner to that employed in the construction of brick chimneys.

It is a well-known fact that any constructions made entirely of iron are practically immune against the effects of lightning, as the amount of electricity accumulated in the case of a lightning stroke is allowed to distribute itself over the structure and flow off to the earth at many places with greatly reduced intensity. Conditions are quite similar in connection with buildings made entirely of reinforced concrete, as the discharging current will find the iron and distribution rods of a reinforced concrete structure struck by lightning a good conductor of electricity; therefore neither artificial lightning arresters nor parts of such will be required in any construction consisting entirely of reinforced concrete. Despite this fact, however, reinforced concrete chimneys are usually fitted with some form of additional protection, a conductor of the form of a thin copper tape often being seen running down the side, but as quite a number of reinforcing rods are carried to the full height of the chimney all that seems necessary is to provide a number of discharge points projecting above the chimney and connected to the vertical rods.

Table of concrete and steel required in chimneys for various unit stresses. (Taylor, Glenday, Faber.)

Stresses per sq. in.		Total thickness of Concrete Shell.		Total area vertical Steel required.	
Concrete.	Steel.				
600	12,000	$\frac{M}{4,582R^2} + \frac{W}{1,372R}$		$\frac{M}{6,408R} - \frac{W}{7,776}$	
600	14,000	$\frac{M}{3,409R^2} + \frac{W}{1,410R}$		$\frac{M}{7,551R} - \frac{W}{8,990}$	
600	16,000	$\frac{M}{2,866{\cdot}5R^2} + \frac{W}{1,419R}$		$\frac{M}{8,685R} - \frac{W}{10,230}$	
400	16,000	$\frac{M}{1,376R^2} + \frac{W}{911R}$		$\frac{M}{8,600R} - \frac{W}{9,698}$	

THE NEW MARINE DRIVE AT SCARBOROUGH.

The new marine drive, linking up the north and south bays at Scarborough, which was formally opened on Wednesday last by the Duke and Duchess of Connaught, has been one of the most costly works of its kind constructed during recent years by any municipal authority in Great Britain: the total cost up to date being £120,000. The following particulars of the work are taken from the "Times":—The sea wall of the drive is 4,200ft. in length and varies in height from 22ft. to 40ft. It is built upon Oxford clay or blue shale, and the foundations are 4ft. below low-water mark. The wall has a concave front to the sea and is constructed entirely of cement concrete, whilst the face and a portion of the back, in the more exposed portions of the work, are built up of blocks varying from 1.5 to 9 tons each, made of concrete 6 to 1 and backed with mass concrete 8 to 1. The space behind the wall has been filled with material scarped from the face of the cliffs, and upon this has been constructed the promenade and carriage drive. The promenade is 20ft. in width and is paved with 6½ins. of concrete paving, laid *in situ* on an underbed of 12ins. of 8 to 1 concrete. The roadway is 40ft. in width, and in the more exposed portions of the work it is paved with concrete blocks 2ft. by 1ft. by 7ins. These blocks are laid on an underbed of 12ins. of 8 to 1 concrete and are bedded with lime mortar and grouted up with cement, so that in the event of any settlement of the filling behind the walls upon which they are laid the blocks may be easily taken up and relaid.

RICHMOND BRIDGE.—At the last meeting of the Surrey County Council the Highways Committee, upon consideration of a communication from the Richmond Town Council, decided that they could not advise the County Council to entertain now or in the near future a proposal either for the rebuilding of Richmond Bridge or the building of a new bridge on another site.

HOLLOW REINFORCED CONCRETE POLES & PIPES.

A new process for manufacturing hollow poles and pipes of reinforced concrete has just been introduced into this country by Messrs. Siegwart, Ltd., of 1, Great Chapel Street, Westminster. It is the invention of Mr. Hans Siegwart, of Lucerne, Switzerland, who is well known as the inventor of a system of reinforced concrete fire-resisting floor construction made up of hollow tubular beams laid side by side. Mr. Siegwart is noted for his originality in dealing with concrete, for in making his beams he builds them in slab form and cuts them up into separate beams by means of a saw while the concrete is still soft, *i.e.*, just as it has begun to set. In this latest invention he has again treated the material in a novel fashion. The principle that he has worked upon is entirely different from the customary method of manufacturing concrete, namely, by casting it in a mould and allowing it to harden therein. Mr. Siegwart uses the material in a plastic way very much like clay, paper pulp, or metal, for by his process of wrapping the concrete around a core no moulds are required to give it shape and form.

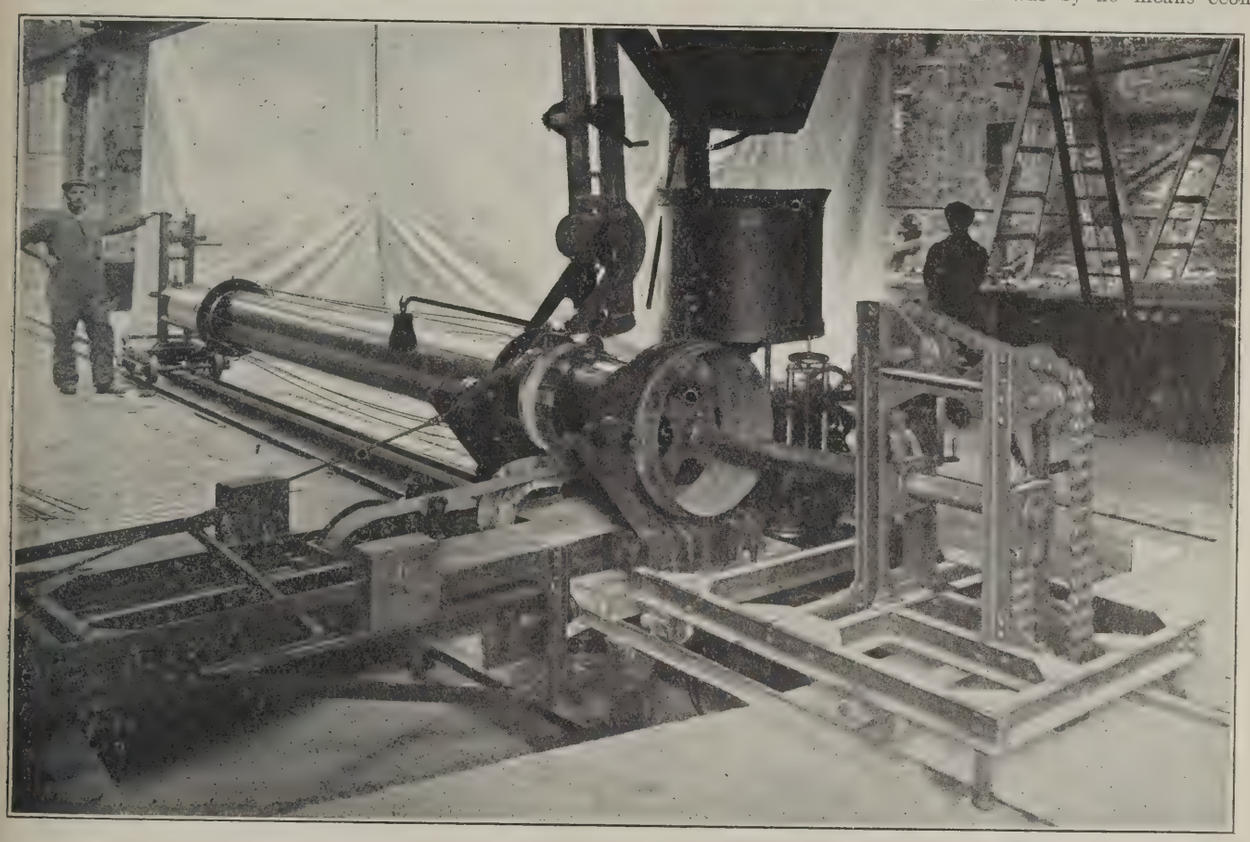

FIG. 1. THE SIEGWART MACHINE FOR THE MANUFACTURE OF HOLLOW REINFORCED CONCRETE POLES AND PIPES.

Poles and pipes, which it is the purpose of this invention to manufacture, are made in a really wonderful machine by a most interesting process. The machine has been installed at the works of The Cubitt Concrete Construction Co. at 260, Gray's Inn Road, London, W.C. Before dealing with it in detail, and the method of manufacture, we may refer to the general subject of the use of reinforced concrete for such articles as poles and pipes.

Reinforced Concrete Poles.

First, as regards reinforced concrete poles in connection with the transmission of electricity for power and other purposes. At first timber poles were adopted, and they are still extensively used, their initial cost being much less than iron poles, though their life is comparatively short. Various means have been tried with the object of increasing the life of timber poles, such as impregnation with preservatives like creosote, and by these means the life can be extended from about 6 to 10 years. The chief difficulty occurs at the point where the pole enters the earth. In view of this difficulty a trial was early made to protect the end of the pole by either covering it with bandages or embedding it in concrete. The best attempt in this direction was, however, to fix a pole on an iron base-plate upon a block of concrete, with a hollow insulating space between the wood and the concrete. This method renders the bottom of the pole practically as durable as the top, but the life is not increased beyond 16 years. Still, a steel or iron pole, though expensive in first cost, proves economical by reason of its much longer life, as compared with timber, and it has been extensively adopted. If of tubular form it is constructed of cast-iron, but the latest type for high poles is built of steel in lattice form. To keep an iron pole efficient, however, it must be periodically painted, and the cost of upkeep is considerable.

Another attempt to render the timber pole equal in economy to the iron pole was made by Bougeat, who surrounded the ordinary wooden pole with a casing of concrete. The manufacture was expensive, and the results were not satisfactory, for in course of time the embedded wood swelled and decayed, and sometimes cracked the pole, and the strength, of course, disappeared as soon as the wood decayed. As the outcome of this, reinforced concrete was tried. The difficulty, however, in constructing a reinforced concrete pole was to render it light in weight, which it must be, and also to manufacture it cheaply. There is no particular trouble in casting a reinforced concrete pole if it is solid, but when the endeavour is made to manufacture a hollow pole, difficulties immediately arise. Short lengths of poles or pipes have been cast between an inner core and an outer casing of metal, but the work is awkward to carry out even then, especially if reinforcements are introduced into the narrow space between these two sheetings. The difficulty became overwhelming when a long hollow pole had to be cast. Consequently, the inner core was left within, and the weight had also to be considerably increased beyond what was necessary. The embedded wooden core was liable to swell and injure the concrete, and such a process of manufacture was by no means economical. The first cost of such poles was greater than that of iron poles, so that their use was only experimental, except for high power transmission lines, for which solid reinforced concrete poles have been found of practical service.

Reinforced concrete, though it has the great advantage of enabling poles of great height to be constructed that are very durable and require no expense in upkeep, has not been possible of adoption for ordinary work. The Siegwart process, however, overcomes all difficulties and enables reinforced concrete poles to be constructed at a price which not only is very much less than the first cost of iron poles, but affords no excuse for continuing to use the ordinary timber poles that are customarily adopted for light telegraph and telephone posts.

Poles for carrying wires have to sustain stresses induced by the suspended

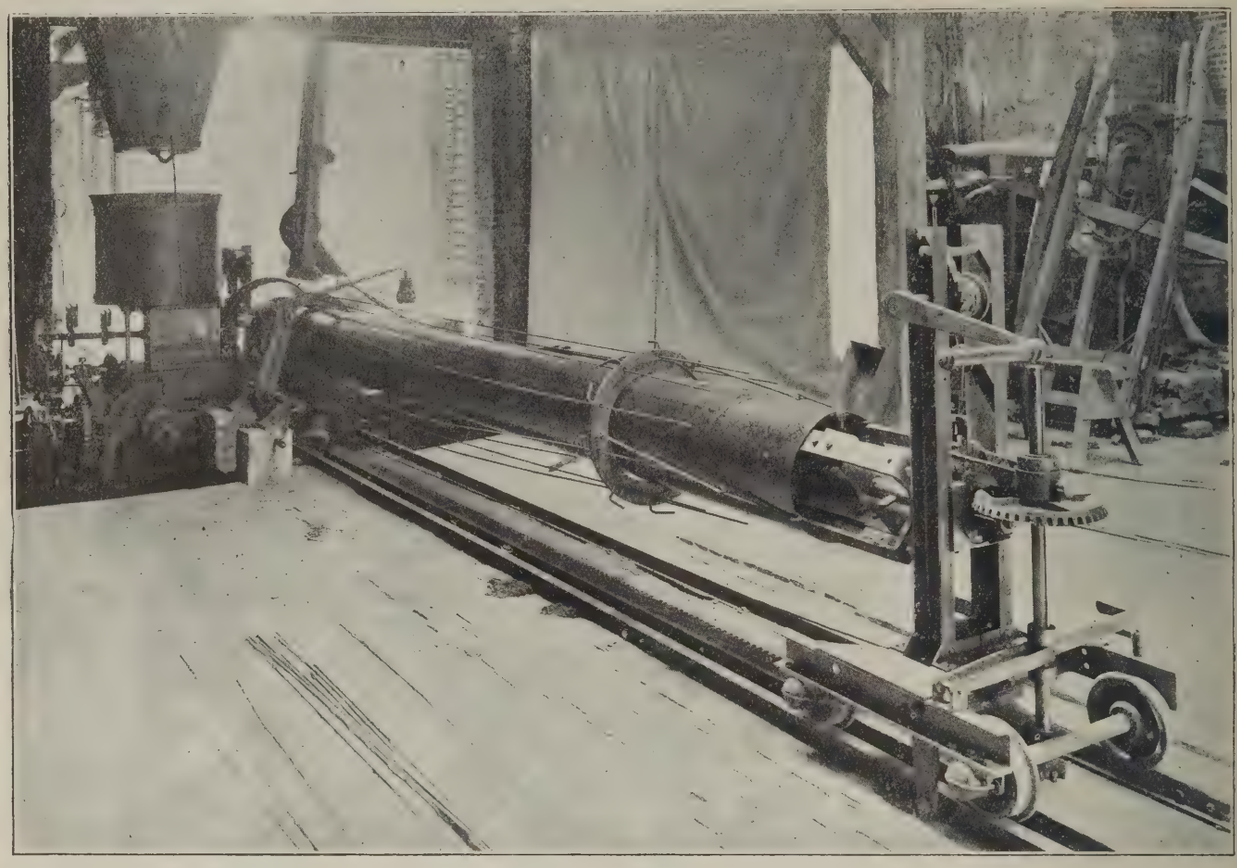

FIG. 2. ANOTHER VIEW OF THE SIEGWART MACHINE.

wires and by wind pressure. Where poles are required for long distance transmission the importance of adequate security is very great, for the execution of repairs over a wide area is troublesome and costly. For such purposes the reinforced concrete pole offers advantages which place it far ahead of any other means of conveying power. The Siegwart poles have been constructed on a proper theoretical basis of calculation with any desired factor of safety, and tests have been conducted upon poles of standard construction which have established a safety factor of 5.5.

The following are comparative estimates of the cost of Siegwart poles, compared with other poles over a period of 50 years :—

Tramway Poles, Height 29ft. (ordinary type).

	Siegwart.	Iron.	Wood. (Impregnated).
	£ s. d.	£ s. d.	£ s. d.

Total cost in 50 years	5 4 0	13 11 6	13 13 10

Reinforced Concrete Pipes.

These have been constructed for many years on a large scale. Reinforced concrete can be applied to the construction *in situ* of water mains, aqueducts and sewers, but difficulties are encountered in moulding a pipe, especially when of small diameter. We have referred above to the difficulty of concreting within a narrow space left between an inner core and an outer sheeting, especially when hampered by the reinforcements placed therein. To tamp the concrete from one end is difficult, and though a very wet mixture of sand and cement is used and poured into the moulds, the manufacture entails difficulties which render the cost of such pipes considerable, though the fact that such pipes have been extensively used abroad, and have even been employed in this country, proves that the ordinary method of manufacture will compete with iron and large earthenware pipes. The advantages of reinforced concrete as regards durability (for the concrete thoroughly protects the embedded metal against corrosion) are obvious, but the Siegwart process of manufacture affords additional arguments in favour of reinforced concrete pipes, apart from the economy which is claimed to be effected over the other methods of manufacture. There is, for instance, a saving in the cost of jointing by reason of the greater length of the pipes, these being as long as 20 ft., or twice the length of iron pipes, and four times the length of plain concrete or earthenware pipes, and also a saving in the other expenses of laying in regard to the cutting of the trenches, for the width of the latter can be reduced to a minimum, except at the point where the joint has to be made. Also, the comparatively small number of joints reduces troubles likely to be caused by expansion and contraction due to temperature changes, and so increases the reliability of a pipe line constructed with Siegwart pipes.

These can be constructed to withstand very great pressures. In the case of the larger pipes, which are made up to 2 ft. in diameter, the strength is, if necessary, as much as six atmospheres, while the smaller pipes are made to withstand an interior pressure of 12 atmospheres. A reinforced concrete pipe is naturally strong against external pressure, and, if required, it can be specially reinforced for this purpose. It has considerable resistance against fracture during transport or by shocks caused by street traffic, being of small weight, owing to the thinness of the walls, which varies from $\frac{3}{4}$in. to 2in. A Siegwart pipe is only about half the weight of an iron pipe of equal strength; the cost of transport is low; and, furthermore, Siegwart pipes can be manufactured at the place where required for use, so that the cost of transport, such as would be entailed in bringing either earthenware or iron pipes from a distance, is completely eliminated. That the utility of the machine for the manufacture of pipes is very great is shown by the fact that large contracts have been given to the Siegwart licensees on the Continent, and while in the experimental stage an order was placed for pressure pipes of a total length of 22 miles for the construction of waterworks in Roumania in substitution for the originally planned construction with cast-iron pipes. This is a testimonial of real value.

The Siegwart process can also be applied to the construction for hollow reinforced concrete piles, for which there is considerable demand.

The Manufacture.

We may now describe the process of manufacture. Figs. 1 and 2 show the general arrangement of the machine for manufacturing Siegwart poles and pipes, as erected at the works of the Cubitt Concrete Construction Co. These views show how the machine is placed, resting in an

FIG. 3. SHOWING DEVICE FOR FEEDING SPIRAL BINDING WIRES INTO POLE.

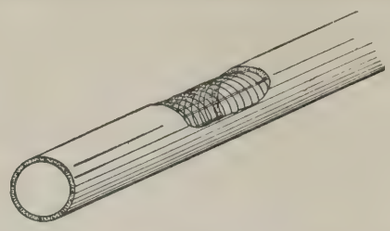

FIG. 4. GENERAL ARRANGEMENT OF REINFORCEMENT, ETC., IN SIEGWART POLES AND PIPES.

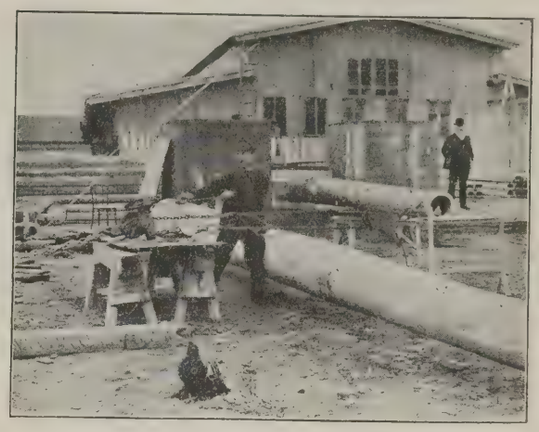

FIG. 5. TEST ON A SIEGWART POLE.

open concrete pit sunk in the ground, with a track on either side, upon which trestles can be run, and a stage over the machine carrying a concrete mixer which discharges into a receptacle below on the machine itself.

The first machines that were built by Mr. Siegwart travelled along a track while the pole remained stationary as regards longitudinal movement. This machine, however, the first to be erected in this country, is also the first to be built to remain stationary while the core is moved longitudinally (as well as rotating on the trestles before referred to). By moving the core instead of the machine, difficulties of feeding the latter with concrete are overcome, and many minor advantages are secured. The hollow space in the interior of the poles or pipes is formed by means of a core of sheet iron, which is removed after the concrete has been applied, the process of removal being made possible by an arrangement whereby the diameter and circumference of the core are reduced by an internal mechanism. Gauge rings are arranged on the core at suitable distances from one another, and steel rods or wires of small section are passed through holes in these gauge rings, and arranged to lie longitudinally upon it. In the pipes these wires or rods are not stretched, for the operation of applying the concrete thereto draws them taut, but in the poles the wires are stretched tightly by means of hooks that are screwed up at the ends of the core.

Upon the track two trestles are placed, as shown in Fig. 1, and the core is mounted between them so as to be capable of rotation therein. The trestles have toothed pinion wheels, which engage with a rack on the track, and are drawn gradually along in the direction of the machine, by means of a wire rope that is wound up by being geared so that the core passes through it at the right rate of progression.

The concrete used in the manufacture of poles and pipes is made of clean screened Thames grit, which consists mostly of sand, with occasionally small stones not larger than ½in. maximum diameter, proportioned 3 to 1 of Portland cement, the brand favoured being "Ferrocrete," which is a cement made by the rotary process by the Associated Portland Cement Manufacturers, Ltd. The concrete is mixed very dry, so that it only feels moist to the hand, and does not even stick together when pressed in the hand. It coheres in the manufacture by reason of the great pressure which is applied.

The mixer on the stage above has paddles which rotate and thoroughly churn up the ingredients in an open box that can be tipped over to discharge its contents into the hopper below. The concrete falls from the hopper into a sheet metal drum (which is clearly seen standing at the back of the machine in Fig. 1). This drum holds a considerable quantity of concrete, namely, about 8 cub. ft., which is sufficient as a rule to make one pole or pipe. It is important in the manufacture that the concrete should be fed regularly and continuously, and the drum is arranged to do this, for it slides up and down a sort of oblong box or chute, so that the surface of the concrete within the drum is always level with the top of this chute. Four paddles rotate within the drum and scrape the surface of the concrete into the chute, and the drum is geared so as to rise gradually as the concrete is used, thus always keeping the concrete level with the top of the chute, and enabling the paddles to scrape the concrete regularly and continuously down the chute. The rate at which this drum rises can be regulated so that the quantity of concrete discharged is greater or less according to the thickness of the layer of concrete which is to be applied to the core.

Applying the Concrete to the Core.

The concrete is applied to the core by means of rotation, which is quite a novel principle. The concrete from the drum falls down the chute upon a conveyer band or belt made of strong steel wire tightly plaited, that takes one wrap around the core, and is given its motion by passing over two wheels. One of these wheels (that at the front of the machine) is mounted in a sliding carriage that receives preliminary adjustment by means of a long screw turned by a spoked handwheel at the back of the machine. By means of the two heavily weighted levers, the sliding carriage applies a pressure of about 5,000 lbs. to the conveyer-belt, so that the concrete is wrapped upon the core under this pressure. Upon the conveyer band is a chain-like device, which affords a grip for a band of strong cloth webbing about 4ins. in width, laid on top of all. The concrete falls upon this webbing, and the webbing and the concrete are wrapped around the core in a continuous spiral, so that the pipe or pole issues with a bandage round it, as shown in Fig. 3. The edges of the webbing just overlap, so that the concrete layer thereunder and the webbing are continuous, the latter so preventing the concrete dropping from the core. The pressure on the conveyer belt draws the longitudinal wire or rod reinforcements closer together. The guide rings holding the longitudinals in position are engaged by a wheel attachment, and thus slide along the rods as the core gradually passes through the machine. Sometimes there is only one guide ring, when only one grooved wheel to engage it is brought into service; but at other times, such as when making long poles, two guide rings are employed, and then a second grooved wheel is brought over to engage with the edge of the guide ring and stop it from travelling with the core.

Immediately the webbing and concrete issues beyond the conveyer belt, wire or wires (as close together as may be desired) are fed by a spool on the attachment shown in Fig. 3, somewhat resembling an elevator. The webbing is drawn up over a bar above this spool of wire, so that the wires for the spiral binding may be fed upon and into the concrete. A rod

fastened to this elevator attachment keeps it rigid, and the rotation of the core draws the wire or wires from the spool so hard against the layer of concrete that they penetrate into it for some distance. If these spiral wires are of large section, the power developed is insufficient to draw them into the layer of compressed concrete; therefore another device is brought into action, consisting of a wheel with spikes thereon that cut grooves in the concrete as the core rotates, into which the wires may penetrate so as to become embedded in the concrete. The rotating core draws the band of webbing upon the surface of the concrete again, and a pressure roller on the end of a long spindle (which is screwed forward by hand) presses this webbing and the concrete hard against the core, in order to give it a maximum hardness. The thickness of the layer is, by the great pressure given by this roller, slightly reduced, and the reduction in diameter and circumference thereby means that the quantity of webbing that was originally fed into the machine is now too long, but the slack is taken up by the elevator attachment above referred to, which is suspended by means of a wire rope running over a pulley on the platform above, having a weight hung from the end thereof, this arrangement enabling the elevator to gradually rise as the amount of slack in the webbing increases. A final finish is given by the sheet-iron ring shown in Fig. 3, smoothing the layers of webbing and concrete.

The electric motor that works the machine is mounted on the bottom frame, and the driving is by means of a worm wheel and several chain wheels. The machine can be adjusted at the necessary angle to the core if tapered, as in the case of a post.

As soon as the core has been drawn through the machine completely wrapped with the spiral binding, it is picked up by a travelling crane overhead and slung on one side to enable the concrete to harden and mature. To ensure its gaining maximum hardness it is constantly wetted.

The interior sheet metal core can be removed by being reduced in diameter by the screw attachment within after about 12 hours, and the bandage of webbing may be removed after three to four days' hardening. This webbing leaves a few small markings, which are no detriment to a pipe or pile, nor for a pole erected in a place where appearances are not of great importance, as in the country.

Completing the Poles.

To complete a pole, all that requires to be done after it comes from the machine is merely to fix a stopper in the top and make a square necking or blocking for fixing the cross-arms that carry the insulators and the electric wires. The former is cast in a mould and dropped into the top of the post; the latter is moulded by hand. Where a more finished appearance is desired, the poles are given a wash of cement grout or a rendering of cement and sand, the latter giving a stone-like appearance, and, if desired, neckings or mouldings may be run around the pole, and any other ornamentation done by hand; indeed, the Siegwart pole can be made very decorative, and although it is a little greater in diameter than an iron pole, this really gives it a better appearance, as the proportion is better. The pipes, as mentioned, require no external finish, but a cement grout wash may be given to the interior if desired, which sometimes also receives a coat of Dr. Angus Smith's solution, or a special cement glaze. The concrete for pipes, too, can be made impermeable by the addition of special waterproofing material. Messrs. Siegwart, Ltd., advocate the "Medusa" waterproofing material for this purpose.

The Reinforcement.

Fig. 4 is a diagram of the arrangement of the reinforcement and details of the construction of a typical Siegwart pole. It will be seen that the reinforcing skeleton consists of longitudinal rods tied together by a wire or wires wound spirally thereon. It is important in such tubular construction to have the reinforcements correctly disposed, and the Siegwart process ensures every control over their position and accurate placing, whereas in the ordinary process of moulding concrete in tubular form, grave defects in this respect are of common occurrence, it being extremely difficult to ensure regularity in the disposition of the reinforcements. The process has the ordinary advantages of additional reliability given by factory labour, specialisation, and organisation.

The longitudinal reinforcements in the Siegwart poles are made each in one length continuous from top to bottom but in the pipes several rods, shorter than the total length of pipe, are often used.

The thickness of the concrete varies from one to two inches in the poles, but the pipes vary from ¾in. to 2ins. in thickness. A Siegwart pipe that has been tested successfully resisted an internal hydraulic pressure of 285lbs. per sq. in. The joint for resisting pressure may be made by caulking with lead, or by filling bitumen in hollow spaces in a special-shaped joint, and passing a short piece of pipe over the joint and connecting it to the pipe with bitumen. It was a joint of the latter form that withstood the pressure of 285lbs. per sq. in. For ordinary pipes not called upon to sustain pressure, the jointing is by means of collars of concrete or sockets on the pipes.

Calculations.

As regard the calculations for the size of reinforcements, thickness of shell and general proportions of the poles, the theory which is adopted is similar to that employed for the strength of chimneys, and the stresses that have to be sustained are tension on the one side, and compression on the other. In chimney designing, however, it is customary to ignore the compressive resistance afforded by the reinforcement, but with a thin shell, such as is possessed by the Siegwart pole, this has to be taken into account. The problem may also be treated from the point of view of a hollow tubular beam, or, rather, a cantilever. The stresses that come upon the pole are not only the tension of the electric wires, but the wind pressure also.

Fig. 5 shows the manner of conducting a test upon the strength of a Siegwart pole. The end of the pole was fixed rigidly between two blocks of concrete, and the top pulled on one side by means of a chain and pulley block, the tension being read upon a gauge, clearly shown in the view. The deflection of the head of the pole was read on a scale placed upon the trestle stationed in front (also shown in the view). This particular pole, which was 31ft. 2in. long, with a tensile stress of 15,400lbs. gave a deflection of only 2.736 ins. When the load was relieved the top end of the pole returned to its initial position, no permanent deflection being noticeable.

The size and disposition of the reinforcements in pipes is determined by a theory of calculations that has been thoroughly worked out. The bursting pressure from the inside is required to be resisted solely by the hoop tension of the spiral reinforcements, while the longitudinal wires resist the bending moment induced in the concrete shell between the spirals, at the same time serving to strengthen the pipe as a beam to resist the forces to which it is subjected in transport, in lifting and placing in the trenches, and in lying on an irregular bed. If the pipes have to withstand pressure from without, the calculations are based on the assumption that each section of a pipe is an eccentrically loaded pillar or post. The thickness of the concrete bears a direct relation to the pressure in this latter case, but with pipes to withstand internal pressure the thickness of the shell is determined not so much by its strength as by its permeability. The thickness of the concrete layer is therefore standardised for various sizes of pipes and pressures solely from practical considerations as regards the impermeability of the concrete, shocks in transport, putting in place, etc. The predetermined thickness of the

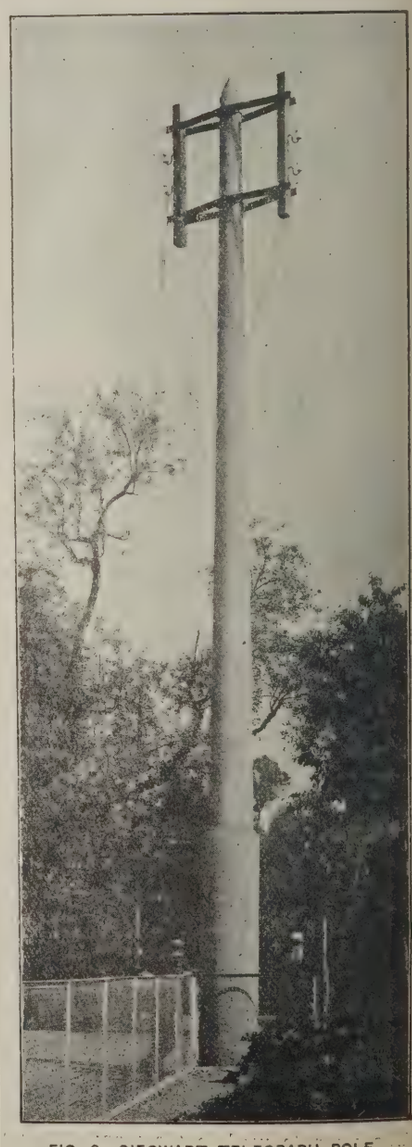

FIG. 6. SIEGWART TELEGRAPH POLE.

concrete shell enters into the calculation for the sizes of the longitudinal reinforcements, though it does not affect the determination of the size and disposition of the spiral reinforcements.

Hollow Piles.

Hollow piles constructed by a similar process can be made up to the standard length of 39ft., which is adopted for the longest poles, though a greater length could be made if desired. The piles usually have their sides parallel, *i.e.*, they are of the same diameter throughout, but sometimes they are tapered. The system of reinforcing a pile with spiral wires is now generally regarded as the most efficient form of reinforcement, but it is difficult to manufacture such a pile to secure thorough homogeneity, and a solid pile spirally reinforced is not only expensive in manufacture, but costly also in handling and driving, by reason of its great weight. A pile is subjected to stresses induced by the shattering effects of the blows in the driving, while it has to sustain the ultimate load as a column, and where driven in situations such as piers or jetties may be subjected to the buffeting of a ship riding against it, when it has to act as a beam built in at both ends, the one end being fixed by the ground in which it is driven, and the other end by the decking.

Columns for ordinary building work can be made advantageously by the Siegwart process.

Fig. 6 shows a Siegwart reinforced concrete pole finished with a smooth surface. This is erected at Miggern, Switzerland. It has a total height of 54ft., and as this is greater than the standard length of poles manufactured, it has been obtained by fixing an ordinary pole in a base which stands 16ft. 5ins. above the ground, and embedded 6ft. 6ins. in the ground, resting upon a foundation of rough stones and filled with stones to form a bearing for the pole proper. The pole in this case is quite plain, but the harmony of the appearance due to the tapering shape shows how well the Siegwart pole is proportioned. The peculiar arrangement for carrying the wires is not at all unsightly, and the whole design seems exactly fitted for its purpose. It may be doubted if any elaborate treatment would make the pole more pleasing under the particular conditions to which this pole is subjected.

The pole was erected by being simply slung from the middle. In this connection it is interesting to note that a pole, having hardened only for four days after manufacture was lifted by one end and put into a vertical position at the works in Gray's Inn Road, and withstood this severe test without showing any ill-effects.

Labour Entailed, and Capacity of Machine.

Eight hands have been employed to work the machine in question, in the experimental stages, but eventually only seven will be required. One labourer is engaged feeding the mixer for the concrete; two labourers and a foreman are engaged working the machine; two lads are engaged in placing the reinforcements on the core; and one man is required to remove the poles. Only one skilled man is thus required. The capacity of the machine is, roughly, about one pole an hour, though with smaller poles and pipes the time required is slightly less. The concrete, of course, is not a big item, and the metal is also of small amount, and costs very little. It will be seen, therefore, that the cost of constructing a Siegwart pole or pipe is small, and the prices at which they can be produced are very low. The market for poles, pipes and piles is an extensive one, and there should be a great future for the invention in this country. Although it is only about two years since the process was introduced on the market, it has already been taken up extensively abroad, several factories being erected for the manufacture of articles with the aid of the Siegwart machines, and many large contracts obtained in competition at remunerative prices.

FORMS FOR REINFORCED CONCRETE.

We may perhaps first explain the use of the word "forms" in the title of this article. The word is of American origin, but is now being adopted in this country, as the earlier terms employed by English contractors, namely, "centering" and "shuttering," are somewhat too restricted for general use in connection with reinforced concrete work, so that a word is necessary that will include the false-work for forming members, such as beams, columns, etc., as well as walls. The terms "centering" and "shuttering" apply only to plain horizontal or vertical work, such as the construction of arches, floors, and walls. Another term, "mould," is again restricted in sense, referring more particularly to forms which are used for moulding separate pieces of concrete, such as artificial stone.

The design and construction of forms is a very important branch of reinforced concrete work, and insufficient care and attention has been directed to the matter. Much of the cost of a reinforced concrete structure is incurred in constructing the forms, and economy may perhaps be effected in this particular more readily than in any other.

At one time it was customary to leave the centering to the contractors, but the importance of this work being placed in the hands of competent engineers is becoming increasingly recognised. Very often the details for the centering are provided by the engineer responsible for the design of the reinforced concrete work.

Economical methods in regard to centering should be impressed upon the designer of reinforced concrete in preparing the plans. Standardisation is the thing to be striven for in all parts where the forms have to be elaborately built up, and they should be capable of being used again and again, or of being easily altered to suit different requirements. Where there is not special reason for doing so, the dimensions of columns should not be varied; thus, the forms will work in again. Recesses, too, should be made the thickness of a board or plank. The width of beams may also often be designed to use standard widths of timber. The framing should be so done that the forms may be not only easily erected, but easily taken to pieces, and removed with the minimum of labour.

As a rule, forms are constructed of timber, although occasionally metal or metal-faced moulds are employed where they are required to stand considerable wear and tear. But if sheet metal is employed, placed upon a wooden backing or upon a metal stiffening frame, there is the great danger of it becoming dented, bent, or otherwise defaced, so as to give an imperfect surface to the concrete; while, if the metal cover is sufficiently thick and strong to resist damage, it often becomes too heavy and expensive for general use. Further, such forms are not sufficiently flexible. Heavy cast-iron moulds can only be used for small moulded work, and the proposal, put forward by Mr. Edison some time ago, to cast houses in situ was impracticable in this respect.

The Timbering for Centering.

As regards the kind of timber to be used for centering, its selection must, of course, be governed by the character of the work, and by the market price of the timber. The best timber for forms is white pine, because it is easily worked and retains its shape if exposed to the weather, but, as it is somewhat expensive, spruce, fir, or, for very rough work, hemlock, is used.

The timber used for the forms may be of any cheap kind, and need not be of good quality. If the timber is well seasoned and dry, it is likely to swell and warp when wetted by the application of the wet concrete, or by a preliminary spraying with water. On the other hand, the timber should not be too wet, as joints may open by exposure on the works. The timber should, therefore, be neither wet nor dry; it is best green or partially dried.

As regards the thinness of boarding, some contractors use 1in., others 1½in., and a few 2in. stuff, even for panels. For ordinary walls 1½in. boards are sufficient, though for heavy construction, where derricks are employed, 2in. stuff is preferred. For small panels 1in. boards are lighter and easier to handle. For floor panels 1in. boards are most commonly favoured, although, if the building is eight storeys or more in height, 1in. boards of soft wood are likely to be worn out before the top of the building is reached, and the under surface of the concrete will show the wear badly. For the sides of girders, either 1in. or 1½in. is sufficient, while 2in. is preferable for the bottom of girders. Forms for columns are generally made of 2in. plank.

The timber work consists of boarding and of battens or timber of larger scantling. It depends upon the thickness of the boarding, as well upon the loading, as to the distance which the battens or larger timbers for strutting are placed apart. We give some rules below for determining the approximate size of timber to be used for the strutting, but we may here note that the customary distance to be placed apart for 1in. boards is 2ft. at the most, and for 2in. boards a maximum distance of 5ft. Not only should the strutting or battens be of sufficient size to resist the weight and the ramming and tamping, but they require to be very securely braced. The plan often adopted is to employ entirely new timber for the first floor to be constructed. This is used up again for subsequent floors, centering sufficient for one floor and a half or two floors being as a rule required, so that one floor is hardening while the other is being constructed. In a building of eight or ten storeys the timber is about worn out by the time the top floor is finished.

Joints.

It is, of course, important that the boarding should butt closely, so that the concrete may not run out of the joints, and there are several points to be noted in regard to this matter.

There should be no bulging or vibration in the forms. To ensure this they have to be stiffly constructed, for not only has the weight of the concrete and the ramming to be sustained, but the additional weight of men and materials. Vibration particularly must be eliminated, for it has a serious effect upon the setting of the concrete, and may easily cause failure in a structure upon the removal of the centering.

If the boards are placed tightly against each other, and are made of dry wood (or if of green wood and they are subjected to a hot sun), when the concrete is applied, the moisture swells the wood, and has a tendency to spring one board above the other. If the boarding is thick, this will make the surface very irregular, but by bevelling the edges of the boards, as shown in Fig. 1, the edges

FIG. 1. CHAMFERED EDGE BOARDING.

slide over each other to a slight extent in the process of swelling without producing any damage.

Tongued and grooved boarding, although it gives a better result than ordinary square-edged or bevelled-edged boards, is expensive, by reason of the waste in dressing and the wear at the joints; and the first cost is more than with plain boards. When the boarding consists of rough boards, it is very important to prevent the concrete dripping through cracks. Some contractors fill up any crevices with clay, and others use rags or tow for the same purpose. Another method is to line the forms with coarse canvas or jute, while oil-paper is also favoured; to give a fine surface finish it requires little or no treatment afterwards.

Rough boarding is sometimes covered with a layer of plaster or Paris or lime concrete; sheet iron or zinc are also sometimes fixed to the boards. For constructing some large arches clay has been puddled over the rough boarding, and covered with thick oil-paper. In the United States, Ransome has applied V-shaped strips to the centering for forming walls, which leave the surface lined as dressed masonry, and the surface of the imitation stone blocks may be left smooth as ashlar, or roughly scabbled with a pick or chisel to give a rock-face.

The insistence upon stopping holes in the centering is required, because of the importance of avoiding holes in the finished surface that will require stopping afterwards, as much as by the loss of strength that may be occasioned by the cement mortar running out.

As regards the preparation of the boards, this depends upon the surface which it is desired to give to the concrete. Where the work is required to show a good finish, the boards are often planed, and sometimes, in order that the timber may come away from the concrete readily, the forms are painted with a mixture of soft soap or crude petroleum oil; or sheets of paper are placed thereon. As a general rule, however, where surfaces are intended to be plastered, it is sufficient to wet the forms with a hose before putting the concrete in place. In rough work the boards are often not planed.

Linseed oil is sometimes used for coating the centering. In applying crude oil to forms, the object is not to cover it with a film of grease, but merely to fill the pores of the wood. The oil or grease should be full enough to do this. Where the timber is used again and again, each time it should be greased with oil before the concrete is applied. If the concrete has set and hardened for several weeks before the forms are removed, it will have a greater cohesion in itself than adhesion, so that no oil or grease will be necessary, though, as before remarked, it is as well to thoroughly wet the boarding before putting the concrete in the forms.

In detailing it is best to keep in mind the wrecking more than the erection, as economy in forms depends greatly on how many times a form can be used with the least amount of repairing. The hammer, saw, and nails should be done away with as much as possible in the erection, recourse being had to bolts, wire, or hoop-iron. The experience of some designers has been that 2in. timber should be avoided as much as possible, except in beam and girder bottoms, as it is claimed that money is in this way saved in the first cost of the timber, while the forms are more easily handled and hoisted. Experience goes to show that forms of lighter timber are better than heavy timber in an equal amount of heavy usage. One inch by 6in. tongued and grooved or bevelled-edged pine or spruce makes ideal timber forms. Boards wider than 6ins. have a tendency to warp.

Nails for holding portions of the centering together should be as few as possible, and if boards must be nailed, the nails should be only partially driven, so that they may be withdrawn by means of a hammer without injury to the timber. It must be impressed upon the carpenters that the pressure of the concrete will, in many cases, hold temporary panel boards, etc., in place with scarcely any nailing. Unless their attention is drawn particularly to this, and they have had some experience in the matter, it will be difficult to get them to conform to the best and most economical practice, while it is important not to have forms irregularly placed and out of alignment. Too correct an exactitude in this direction, however, should not be insisted upon, or it will increase the cost of the work unduly. A good rule that has been suggested is an allowance of $\frac{3}{8}$in. departure upon established lines on finished work, and 2in. on unfinished work.

The timbers, of course, have to resist the weight or pressure of the material deposited thereon or therein. Where a considerable height of wet concrete is put in at one time—for instance, in columns or walls—the pressure must be calculated as a liquid, and an assumption that has been found to work well in practice is to consider the concrete as a liquid of half its own weight, or 75lbs. per cub. ft. In ordinary walls, where the concrete is placed in layers, exact calculation is usually unnecessary, since experience has shown that the maximum bracing for 1in. boards is 2ft., for $1\frac{1}{2}$in. boards 4ft., and for 2in. boards 5ft., while the studding usually varies from 3ins. by 4ins. to 4ins. by 6ins., according to the character of the work and the distance of the horizontal braces or walling—4in. by 4in. is the most useful size.

As regards forms for floors, it is not so much the strength that has to be considered, but the deflection under the load, for they must possess sufficient stiffness to prevent sagging and consequent rupture of the concrete. Therefore, in calculating, in addition to the dead load, a consideration for a live load coming upon the concrete while setting should be added. Mr. Sanford E. Thompson, M.Am.Soc.C.E., suggests the following basis for calculations:—

1. Weight of concrete, including reinforcements, 154lbs. per cub. ft.
2. Live load, 75lbs. per sq. ft. upon slab, or 50lbs. per sq. ft. in figuring beam and girder forms.
3. For allowable compression in struts use 600 to 1,200lbs. per sq. in., varying with a ratio of the size of the strut to its length (see Table). If timber beams are calculated for strength, use 750lbs. per sq. in. extreme transverse fibre stress.
4. In calculating planks, joists, and timber beams, use the following formula, allowing a maximum deflection of $\frac{1}{8}$in.:—

$$d = \frac{3}{384}\frac{WC}{EI} \cdots 1)$$

$$I = \frac{bh^3}{12} \ldots\ldots\ldots (2)$$

d = greatest deflection in inches,
W = total load on plank or timber,
C = distance between supports in inches,
E = modulus of elasticity of lumber used,
I = moment of inertia of cross-section of plank or joist,
b = breadth of lumber,
h = depth of lumber.

This formula is the ordinary one for calculating deflection, but the coefficient is assumed as a means between $\frac{1}{384}$ over a beam with fixed ends, and $\frac{5}{384}$ simply supported. For spruce and other woods commonly used in form construction, E may be taken as 1,300,000lbs. per sq. in. The weight of concrete per cub. ft. is somewhat higher than is frequently used, but is not too large where a dense mixture and an ordinary percentage of steel are employed. For rough calculation it is frequently convenient to remember that 144lbs. per cub. ft. is equivalent to the product of the dimensions of the beam in inches by the length in feet. The live load suggested is assumed to include the weight of men and barrows filled with concrete and structural materials that may be piled upon the floor, but not including the weight of piles of cement or sand or stone, which should not be allowed upon a floor unless supported by concrete sufficiently strong to bear the weight, or by struts under all the floors below. The allowance for stressing struts are somewhat higher than in timber construction, because the load is a temporary one. When a column or strut is longer than 16 times the smallest width, there is a tendency to buckle, which must be prevented by bracing both ways, or by allowing a smaller load per sq. in.

The following table contains Mr. Thompson's assumptions for struts at different heights ordinarily used. (Bracing both ways, will, of course, reduce the length of a long strut):—

SAFE STRENGTH OF WOOD STRUTS IN FORMS FOR FLOOR CONSTRUCTION.
(Lbs. per sq. in. of cross-section.

Length of Strut.	3" × 4"	4" × 4"	6" × 6"	8" × 8"
14 ft.	500	700	900	1100
12 ,,	600	800	1000	1200
10 ,,	700	900	1100	1200
8 ,,	850	1050	1200	1200
6 ,,	1000	1200	1200	1200

When struts are placed upon a concrete floor that is comparatively green,

the load must be distributed by blocking, preferably of hard wood. At the top of the struts provision must be made against crushing of the wooden planks or cross-piece. Ordinary soft wood will stand, without crushing, only 700lbs. across the grain, so that if the compression approaches this figure, brackets must be inserted, or hardwood cleats used.

Supervision.

Those in charge should be particularly strict in their supervision of the form work. An inspector should be on the work during the setting and the wrecking of the forms, as well as during the placing of the reinforcements and the mixing and placing of the concrete. He should take great care that the form are properly set up and braced, that the concrete face of the forms is given a coat of oil applied with a brush, and that an excess is not used; also that the forms are cleaned every time they are used, that they are correctly placed, allowing the depth and width called for by the plans, and that the inside is free from shavings, sawdust, blocks of wood, etc., just before putting the concrete in; also that the joints in the boarding are tight, so that the mortar in the concrete will not run out, and necessitate such defects being remedied by the use of plaster of Paris coating, strips of wood, paper, or other means. Centering for arches, beams, etc., are lowered slightly at first—just sufficient to allow the member to take its permanent deflection, and to see that there is no fear of collapse. With arches the lowering of the centering is required to allow the arch ring to assume its permanent set before the spandrel walls are constructed. This avoids the possibility of cracks occurring in these walls by reason of excessive settling in the arch.

In removing forms the green concrete should never be disturbed by prying the timber away from it, for such a method is bound to injure the concrete.

As regards the length of time which should be allowed to elapse before the removal of the forms, generally it may be said that the closer the load to be sustained approaches the load for which the member is designed, the longer the form should remain in position. Thus, the forms for a overhanging cornice should remain in place longer than for forms for almost any other member, because the dead load of the cornice forms a very large percentage of the total weight which it is designed to carry. By similar reasoning, roof forms should remain longer than floor forms; floor forms longer than column forms; column forms in the top storey of a building longer than column forms in a lower storey; and column forms in general longer than footing forms. It is important that forms should be so designed that the column forms may be removed without in any way disturbing the supports of the beams and girders. In removing beam and girder forms, the posts should be removed from only one beam or girder at a time, and as soon as the form for this beam or girder is removed, the post should be replaced immediately. By this method danger of failure of concrete through poor workmanship is much diminished, as a defective member is supported by the members on either side of it. The practice of removing all the posts under a floor at the end of any given period without removing them one by one, and carefully examining the work and replacing the posts, must be strongly condemned. There is less danger in taking down column forms when the concrete is 36 hours old, and floor forms when the concrete is five days old, if the posts of each member are removed separately and are replaced as soon as possible, than there is in knocking out all the posts in a large piece of flooring after three weeks.

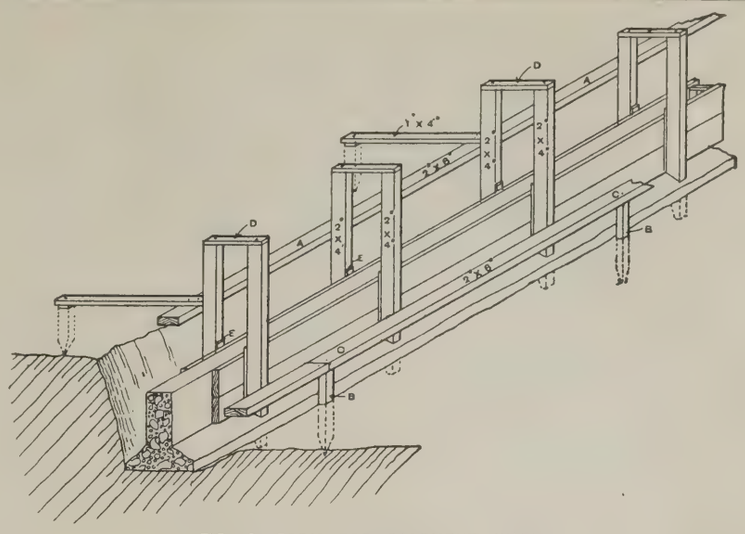

FIG. 2.—FORM FOR BASEMENT WALL.

In ordinary warm weather, if forms sufficient for only one storey are used, the rate of progress may be about one storey every two weeks. By having one complete set of column forms and a set and a half of floor forms, a speed of one storey a week may be attained.

It is very important to get rid of all dirt, shavings, and sawdust before the concrete is applied. The method that has been adopted in a few cases is to leave a hole in the centre of each floor panel, and also to provide a hole at the bottom of each column form, so that the dirt may be cleared out. With columns it is a good plan to wash out any débris with a hose.

Forms for Walls and Partitions.

Forms for walls and partitions consist of two timber sides propped up from the outside to resist bulging, or held together through the thickness of the wall by bolts or ties. If constructed the whole height of the wall, there is very much the same difficulty as with columns in pouring concrete therein, especially when reinforcements are required, as they are likely to be displaced by such a method of concreting. The walls should be brought up bit by bit, having the concrete spread in layers. Vertical boarding in this case is often termed shuttering. One side may be built to the whole height, and the other brought up gradually, though it is more convenient as a rule to bring both sides up bit by bit.

In constructing partitions, these are sometimes made by using only boarding on one side, the concrete being brought up with a quick-setting cement by an operation similar to plastering. This is economical for thin partitions.

Hollow walls are occasionally built *in situ* by using a timber core, which is either drawn up as the work proceeds, or collapsed and withdrawn afterwards.

The size of studding for the construction of a wall depends upon the height and the amount of bracing which can conveniently be used. For a light form with 1in. boards, 2in. by 4in. studs may be satisfactory. If, however, this size is used for a high wall, horizontal timbers must be placed up the wall and carefully braced about every 5ft. apart to prevent the studs from springing. If 2in. boards are used, the studding can be placed further apart, but it must then be heavier, the common size for it being 4ins. by 6ins., 2ins. by 10ins., and 4ins. by 10ins., depending upon the character of the work and the material at hand.

The diagonal braces that run down from the studding to the ground should be securely lodged against stout posts of immovable supports, but as a rule it is better to avoid the use of such diagonal props by connecting the studding through the wall to the studding on the opposite side by means of bolts or wires. An easy, cheap, and satisfactory method of connecting the studs on opposite sides of the walls is by the use of wires wound round the uprights on each side, and twisted by means of a stick or nail. To remove the forms the wires are simply cut, and afterwards they can be trimmed off close to the surface of the concrete. If the forms should buckle in the construction of a wall, it is usual to try to true up the timbering, but it must either be left to sag or to warp, and the concrete dressed afterwards, left with its irregular form, or else the work must be demolished and re-done, for to straighten a concrete wall would only crack it, and a cracked wall is not only dangerous, but entirely inefficient.

Fig. 2 shows a simple form for a soil or foundation wall, in which bearers A A and C C are spiked to occasional studs, whose pointed ends are driven into the ground, and kept in line by strips of wood running from them to stakes in the ground alongside, or by similar stakes directly underneath the boarding—in this case, 2ins. by 6ins., this applying to the inside row of studs. The tops of the studs are held together by clips D D running across the wall. Vertical strips E E, about ¾in. square, are placed inside each stud for the boarding of the form to rest against, and after a section of the concrete has been applied are easily knocked out, and the boards raised again to another level. The first layer of concrete is permitted to flow out under the lower boards to form a footing, above which the soil floor is laid.

Another simple form for constructing a basement wall or rough walling is shown in Fig. 3. The concrete is laid

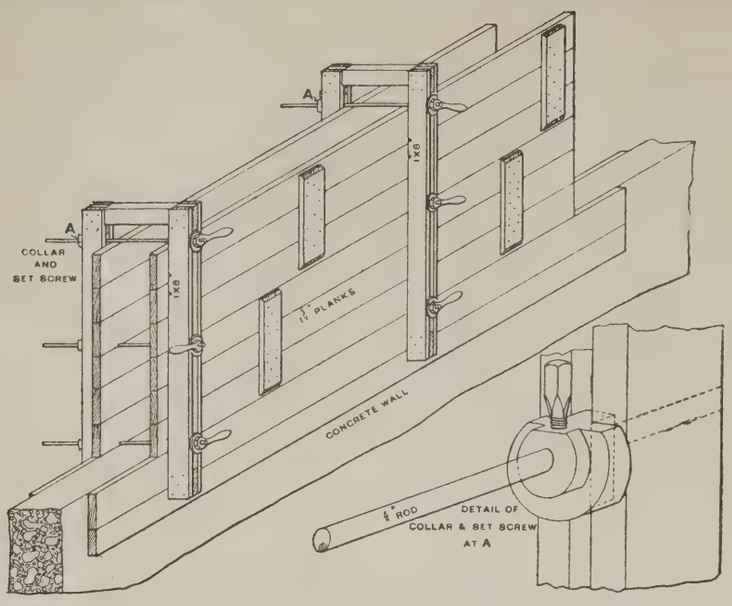

FIG. 3.—FORM FOR WALL.

FIG. 4.

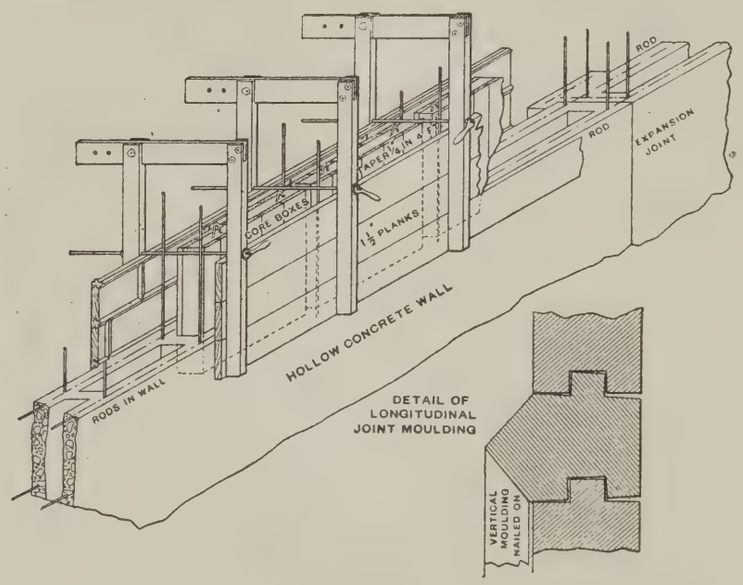

FIG. 5.—FORM FOR HOLLOW WALL.

to the full height of the planking, by which time the lower section will have hardened sufficiently for the bolts to be loosened, and the slotted strutting raised one-half the length. The board is now taken away from below and placed at the top, and a fresh layer of concrete applied. Thus, one-half of the form always overlaps the concrete below, and keeps the wall true and straight. The bolts must be greased each time they are used, as this allows them to be withdrawn easily, the holes left by their removal being afterwards filled with mortar. The collar and set-screw shown in Fig. 4 is a convenient means of tightening the rods when the walls are of various thicknesses, although in the majority of cases an ordinary threaded bolt with nut and washer may be used, as shown in the illustration.

Fig. 5 shows a form for constructing a hollow wall, the studs and bolts so arranged that the latter do not pass through the concrete, the form being raised when the concrete reaches their level. The core-boxes have a taper of ¼in. in 4ft., being pulled up as the wall is built in sections. This form has V mouldings upon the boarding to give the appearance of chamfered stone blocks. The illustration shows a detail of the manner of making these moulds, which are tongued and grooved with edges slightly bevelled. This is preferable to nailing triangular strips upon the planks.

Some years ago there was a considerable interest taken in the construction of concrete walls. Mr. Thomas Potter was an early pioneer in concrete construction, and long ago took out patents in connections with forms for walls. Fig. 6 shows his patented method.

(To be continued.)

THE TESTING OF MATERIALS.

The fifth congress of the International Association for Testing Materials will be held in Copenhagen early in September 1909. The proceedings of the congress will consist largely in official reports of standing committees and individual references on scientific subjects relating to the testing of materials. By action of the council, non-official papers by members of the association to be presented at the congress will be restricted to the following subjects:—

Metals: (a) Metallography; (b) hardness testing; (c) impact tests; (d) testing metals by alternating stresses, thermal treatment, etc.; (e) testing of cast iron; (f) influence of increased temperature on the quality of metal.

Hydraulic Cements: (g) Reinforced concrete; (h) progress in the methods of testing; (i) cement in sea water; (j) constancy of volume; (k) tests by means of prisms and standard sand; (l) weathering resistance of building stones.

Miscellaneous: (m) Oils; (n) caoutchouc; (o) wood; (p) paints on metallic structures.

The address of the general secretary of the International Association is 11, Nordbahnstrasse 50, Vienna.

A LARGE NEW STAIRCASE AT THE LAW COURTS is being constructed, leading from the west side of the central hall to the court corridor near the Divorce and Chancery Courts. It will give direct access to the various courts, and will be a great convenience.

Practical Notes for Architectural Draughtsmen.

By ALFRED W. S. CROSS, M.A., F.R.I.B.A., and ALAN E. MUNBY, M.A., A.R.I.B.A.

Complete Set Now Ready (27 Large Plates in a Portfolio), 12s.

POST FREE, 12s. 6d.

Prof. C. H. REILLY, of Liverpool University, says: "I think it is a very valuable book, and I hope it will find its way into most architectural offices."

THE "PRACTICAL NOTES" gives in most convenient form for use on the drawing board examples with concise rules, explanations and dimensions for preparing Designs, Perspectives and Working Drawings for Classical Architecture with rapidity and precision.

STUDENTS preparing for the examinations of the R.I.B.A. can learn how to draw The Orders correctly with the smallest possible amount of study and work by utilising the invaluable drawings and data given in this publication.

THE MANAGER, TECHNICAL JOURNALS, LTD.,
Caxton House, Westminster, S.W.

Descriptive Leaflet sent Post Free upon Application.

Tenders.

Addressed postcards, on which lists of tenders may be stated, will be sent free on application to the Manager, BUILDERS' JOURNAL, *Caxton House, Westminster.*

Information from accredited sources should be sent to "The Editor," at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Bedford.—For enlarging the billiard and concert rooms at the Conservative Club, St. Peter's Street. Mr. Harvey H. Sale, architect, 11, Silver Street, Bedford. Quantities by the architect:—

C. Negus	£836 0 0
— Jones	799 0 0
— Casbeard	739 0 0
Jacobs and Burton	730 8 0
S. Foster	728 0 0
Corby and Son	722 0 0
S. Freshwater	719 0 0
Laughton	682 10 0

Architect's Estimate, £725.

Cheshunt.—For the erection of a school, for the Hertfordshire County Council. Mr. U. A. Smith, county surveyor:—

Fitch and Cox, Enfield	£5,999 0 0
J. and F. Patrick, London	5,790 0 0
Jennings and Grenfell, Waltham Cross	5,550 0 0
Sabey and Son, Islington	5,514 0 0
A. N. Coles, Chelsea	5,506 0 0
A. Fairhead and Son, Enfield	5,498 0 0
J. Chessum and Son, London	5,467 0 0
General Building Co., London	5,425 0 0
Henson and Son, Wellingborough	5,314 13 6
A. Monk, Edmonton	5,245 0 0
B. E. Nightingale, Albert Embankment	5,234 0 0
Knight and Son, Tottenham	5,216 0 0
P. R. Paul, Waltham Abbey	5,212 0 0
Hacksley Bros., Wellingborough	5,177 0 0
W. Lawrence and Son, Waltham Cross	5,172 0 0
Clark and Sons, Cambridge	4,542 5 0

Colchester.—For the erection of the new Essex county lunatic asylum at Mile End, Colchester. Mr. F. Whitmore, county architect, and Mr. W. H. Town, A.R.I.B.A., architects:—

Pethick	£237,777
Foster and Dicksee	233,332
Parnell and Son	222,334
McCormick and Son	222,222
Minter	220,000
Young and Son, Norwich	214,995
C. Wall	214,000
F. Bennett, Ipswich	212,600
H. Lovatt	207,789
Lowe and Son	206,925
A. G. Bateman	204,307
H. Willcox	202,500
Pattinson and Son	202,426
Perry and Co.	199,350
Wallis and Son	198,840
Leslie and Co.	197,000
W. E. Blake	195,000
Allen and Sons	194,000
Arnold and Son	191,866
King and Son	191,700
Waring and White	191,545
Kirk and Randall	189,777

Colne.—For excavator, mason, and bricklayer's work in connection with the erection of public baths in Swan Croft, for the Corporation. Mr. T. H. Hartley, borough surveyor, Town Hall, Colne:—

J. R. Atkinson, Colne	£2,610 13 6
J. Crossley, Colne	2,469 9 4
Ward and Tetley, Bradford	2,409 15 4
W. Townson, Colne	2,379 [illegible]
T. E. Sugden, Keighley	2,336 3 7
P. Robinson,* Foulridge, near Colne	2,329 0 0
Smith Bros., Burnley	2,240 0 0

*Accepted.

Dunston.—Accepted for the construction of a new power station at Dunston, for the Newcastle Electric Supply Co.
R. McAlpine and Sons.

Dublin.—For the erection of technical schools in Bolton Street, for the Corporation. Plans by city architect:—

Beckett	£40,000 0 0
G. and T. Crampton	38,860 0 0
Pemberton and Son	38,250 0 0
Mackey	37,770 0 0
McLoughlin and Harvey	37,267 0 0
Collen Bros.	36,762 19 0
J. and P. Good	36,600 0 0
Hull and Co.	36,498 0 0
Donovan and Sons	36,421 0 0
J. and W. Stewart	35,293 0 0
Langley	34,995 0 0
H. and J. Martin,* Belfast and Dublin	34,000 0 0

*Accepted.

Holme Cultram (Cumberland).—Accepted for protection sea wall, for the Urban District Council.
Dawson, Whitehaven, £4,695.

Horncastle (Lincs.).—For the erection of new grammar school at Horncastle, for the Lindsey County Council Education Committee. Messrs. Scorer and Gamble, architects, Bank Street Chambers, Lincoln:—

Moss and Son, Loughborough	£3,920
Maxey and Son, Sleaford	3,920
Hockley and Co., Grantham	3,800
Thompson and Son, Louth	3,818
F. Scarborough, Lincoln	3,782
Pattinson and Son, Ruskington, Sleaford	3,595
Parker and Son, Boston	3,578
Wright and Son, Lincoln	3,556
Mawer Bros., Louth	3,549
Sutton and Horton, Horncastle	3,502
Hensman and Son,* Horncastle	3,487

*Accepted.

Kendal.—For widening Nether Bridge, for the Westmorland County Council. Mr. J. Bintley, architect and county surveyor, 7, Lowther Street, Kendal:—

S. Johnson and Son	£2,517 4 0
J. Howe	2,077 11 0
J. Howie	1,879 2 6
R. T. Pennington, Kendal	1,652 0 0

Kettering.—For alterations and additions to police station, for the Northamptonshire County Council. Mr. C. S. Morris, county surveyor, County Hall, Northampton:—

R. Cosford	£4,479 0 0
F. Henson	4,350 0 0
W. M. Freeman	4,335 0 0
E. Archer	4,275 0 0
E. Green	4,264 0 0
H. Martin	4,250 0 0
Brown and Sons	4,147 10 0
Berrill and Green	4,145 0 0
R. Marriott	4,087 0 0
W. J. Payne	3,972 10 0
Goodman and Murkett	3,939 0 0
Hacksley Bros.	3,875 0 0
A. Lewin and Sons	3,835 0 0
O. P. Drever,* Kettering	3,531 11 0

*Accepted.

"ARCHITECTURE & JOURNALISM,"

This is the title of a booklet, beautifully printed and illustrated, giving an interesting account of the publications issued by this Company. This booklet contains a suggestion, and sets out an arrangement showing how Architects and others can utilise any particular points of interest that they come across in their practice, and thus not only add to their own incomes, but add to the value and practical interest of our papers.

SENT FREE on receipt of a Post Card giving Name and Address of any reader.

Technical Journals, Ltd., Caxton House, Westminster, S.W.

BURMANTOFTS' TERRA-COTTA

Burmantofts' Terra-Cotta is proof against the deleterious atmospheric conditions of many of our large towns which so frequently ruin stonework and other facing materials. Burmantofts' Terra-Cotta is strongly recommended for Façades of Public and other buildings.

The Fire-Resisting Powers of Burmantofts' Terra-Cotta are greater than those of any other known building material. It has been conclusively proved that steel, iron, and other material properly encased in Terra-Cotta have withstood the greatest heats.

For Steel and Concrete Constructions Burmantofts' Terra-Cotta is unequalled. It can be jointed and prepared to suit its position, thus saving considerable time, trouble, and expense.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 13. ASHFORD.—Structural repairs at the Ashford Grammar School. Persons desirous of tendering are requested to send in their names to the architect, A. E. Lacey, A.R.I.B.A., Ashford, on or before August 13.

August 13. FENCE HOUSES. — Erection of a workmen's club at Bank Head, Fence Houses. Plans and specifications can be seen at the office of the architect, Mr. Palliser, Philadelphia, Fence Houses. Tenders, endorsed "Tender for Club," to be sent to J. W. Baker, secretary, 30, Cement Street, Dubmire, Fence Houses, by August 13.

(c) Part of Ramsdale Road, Streatham, between Rectory Lane and Crowborough Road, for the Council of the Metropolitan borough of Wandsworth. Specifications and drawings may be seen, and forms of tender obtained at the borough engineer and surveyor's office, New Streets Department, 53, East Hill, Wandsworth, between 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in separately sealed envelopes, and endorsed "Tender for Paving —— Road," must be delivered to Henry George Hills, Town Clerk, Council House, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose not later than 4 p.m. on September 14. If required, the contractor must provide two sureties for the due execution of the contract. Fair wages clause.

SANITARY.

August 17. HASTINGS.—Laying sewers in Waldegrave and Cornwallis Streets, and at the rear of Queen's Road, Hastings, and other work in connection therewith, for the Corporation. Drawing and specification may be seen and form of tender obtained, at the office of the borough engineer, P. H. Palmer, M.I.C.E., Town Hall, Hastings, between 10 a.m. and 5 p.m. Tender under cover, endorsed "Tender for Sewer, Waldegrave and Cornwallis Streets," must be delivered to B. F. Meadows, town clerk, Town Hall, Hastings, not later than noon, August 17.

August 17. DUNHAM MASSEY.—Construction of a detritus tank and screening chamber at the sewage disposal works, Woodcote, Dunham Massey, of the Altrincham U.D.C. Particulars (on deposit of one guinea), with H. E. Brown, surveyor, Town Hall, Altrincham. Tenders, endorsed "Tender for Screening Chamber," addressed to the Chairman of the Sewage Farm Committee, Town Hall, Altrincham, are to be sent in not later than 4 p.m. on August 17. Fair wages clause.

August 18. PORTSMOUTH.—Constructing, completing, and maintaining in thorough repair for six calendar months from the completion of the whole, an eight-stall urinal, upon a site adjacent to Copnor Bridge in the borough of Portsmouth, for the Corporation. The specification and plan may be seen and a form of tender obtained at the borough engineer's offices at the Town Hall. The form of tender is to be completely filled in and sent under cover to reach Alexander Hellard, town clerk, Town Hall, Portsmouth, not later than 10 a.m., August 18. Fair wages clause.

August 20. INNERLEITHEN.—Laying about 1,400 yds. of 4 in., 5 in., 6 in., 9 in., 15 in., and 18 in. sewers to replace existing ones, for the Town Council. Persons wishing to tender will receive schedules for the proposed works from James Thomson, C.E., 22, Rutland Square, Edinburgh, on payment of £1 (which will be returned on receipt of detailed tender), and they will be shown over the ground on giving W. Stobie, town clerk, Innerleithen, 24 hours' notice of their intended visit. Tenders to be delivered on or before August 20.

August 24. GALASHIELS.—(1) Construction of over 15 miles of main and Subsidiary sewers; sewage purification works, including detritus tanks, sedimenaion tanks, and bacteria beds; and the laying out of land for filtration purposes. (2) Providing and erecting sewage distributors, gas producer plant, dynamos, motors, pumps, air compressors, and sludge pressing plant. (3) Erection of pump house with sludge tank, manager's house, and formation of approach roads, for the town council of Galashiels. Persons desiring to submit tenders may obtain copies of the general conditions, specifications, bills of quantities, and forms of tender upon application to W. A. Baird Laing, A.M.I.C.E., at the offices of Messrs. Kyle, Dennison, and Laing, C.E., 175, Hope Street, Glasgow, or 34, Queen Street, Edinburgh, on payment of the sum of £5 5s. in the case of contract No. 1, and £3 3s. in the case of each of contracts Nos. 2 and 3. This amount will be returned to the tenderer after the town council have come to a decision on the tenders received, provided he shall have sent in a bona fide tender, and shall not have withdrawn the same. Plans and drawings may be inspected and other particulars obtained at Mr. Laing's Glasgow office on any day up to August 24; or they may be inspected and other particulars obtained at the Burgh Buildings, Galashiels, on August 11 and 18. An assistant engineer will be at the Burgh Buildings, Galashiels, on August 18, to accompany contractors over and point out the site of the works. The successful tenderer will be required to execute a contract, the draft of which may be inspected at the town clerk's office, Galashiels, between 10 and 4 o'clock, except on Saturdays. Each tender, along with the combined conditions, specifications, and filled up schedule or bill of quantities, must be delivered in a sealed envelope, appropriately endorsed on the outside, to J. B. Lumsden, town clerk, town clerk's office, Galashiels, not later than 1 o'clock afternoon, August 24.

August 24. TRING. — Execution of all work involved by the connection of house drains to the new system of sewerage in the town of Tring, on the basis of a schedule of prices, for the U.D.C. Specifications and schedules may be obtained at the offices of the engineers, Willcox and Raikes, of 63, Temple Row, Birmingham, on payment of a deposit of two guineas, which will be refunded on receipt of a bona fide tender and the return of all documents Sealed tenders, with schedule of prices filled in, in detail, on the form supplied, and endorsed "Tring, House Connections," must be delivered to A. W. Vaisey, clerk to the Urban District Council, Tring, Herts., not later than noon on August 24.

August 27. SURBITON.—Construction of main drainage, for the Urban District Council (subject to the sanction of the L.G.B.). The drawings, specification, bills of quantities and forms of tender may be inspected at the offices of the engineer, C. Nicholson Lailey, M.I.C.E., 53, Victoria Street, Westminster, between 10 a.m. and 5 p.m. (Saturdays excepted), until August 25. Tenders, sealed and endorsed "Surbiton Main Drainage," are to be addressed to F. J. Bell, deputy clerk, Surbiton Urban District Council Offices, Ewell Road, Surbiton, and delivered there before 6 p.m. on August 27.

MISCELLANEOUS.

August 13. PORTSMOUTH.—Supply of Purbeck paving, etc., gravel, sand, and shingle, granite, oils and paints, castings, lime, timber, drain pipes, Portland cement, plumbing work, dredging, erecting ventilating shafts, etc., etc., for the Corporation. Specification and printed form of tender with regard to each of the above items may be obtained at the town clerk's office, Town Hall. Sealed tenders, on the prescribed form, endorsed "Tenders for ——," are to be delivered to A. Hellard, town clerk, Town Hall, not later than 10 a.m., August 13. Fair wages clause.

August 14. BINGLEY. — Asphalting the playgrounds at Myrtle Park Provided School, Bingley, for the West Riding County Council. Plans may be seen and specifications obtained on application to J. Vickers-Edwards, county architect, County Hall, Wakefield. A deposit of £1 is required, which will be returned on receipt of a bona-fide tender. Cheques, etc., must be made payable to the West Riding Treasurer, and sent to him direct, at the County Hall, Wakefield, otherwise applications will not be entertained. Sealed tenders, properly endorsed, to be forwarded to the County Architect not later than 10.30 a.m. on August 14.

Bankruptcies.

During the week ended July 31st, sixteen failures in the building and timber trades of England and Wales were gazetted.

J. Thompson, architect, Kendal. Adj., July 29.

J. F. Greenhalgh, architect, London. Liabilities, £3,678; £988 unsecured.

T. Swart, painter and decorator, St. Helens. P.E., C.C., Liverpool, August 17, at 11.

G. Sayce (trading as J. G. Sayce), builder and contractor, Smethwick. R.O., July 31.

F. W. Ingram, builder, Oxford. P.E., County Hall, Oxford, August 25, at 11.30.

F. Taylor, joiner and builder, Manchester. P.E., C.C., Manchester, August 28, at 10.

S. Warburton, builder and contractor, Miles Platting. Gross liabilities, £24,142; £11,819 expected to rank for dividend; deficiency, £1,106.

R. Bennett, architect, Cheapside, E.C. R.O., July 27. First meeting, Bankruptcy Court, August 13, at 11. P.E., same, September 22, at 11.30.

J. W. Dowdall (trading as Jno. Dowdall and Son), builder, Southampton. R.O., July 28. P.E., C.C., Southampton, August 19, at 12.

J., Jno., and W. L. Paddington (trading as J. and W. Paddington), contractors, Colden Common. Adj., July 3.

C. L. Peppiatt, builder, London. Liabilities, £7,986; £2,470 expected to rank for dividend: assets, £2,500.

W. Keeley and F. J. Beor, builders, Gloucester. Gross liabilities, £1,924; £279 expected to rank for dividend; assets estimated at £69; deficiency, £210.

H. W. L. Prentice, builders' merchant, New Barnet. R.O., July 30. First meeting, 14, Bedford Row, W.C., August 14, at 12. P.E., Town Hall, Barnet, August 27, at 11.

A. C. Yea, road contractor, Newton Abbott. R.O. July 28. First meeting, O.R.'s, Exeter, August 14, at 10.30. P.E., The Castle, Exeter, same day, at 11.30.

A. Dunn, builder, Gloucester. Gross liabilities, £15,233; £14,327 fully secured; £892 expected to rank for dividend; assets, £4,661; estimated surplus, £3,768.

Williams and Son, Ltd., brickmakers, builders, etc., Langley, Bucks. Unsecured debts, £6,467; secured claims, £15,620; estimated surplus assets, £3,246.

C. K. West and T. Bayliss (trading as West and Bayliss), builders and contractors, Prestwich. R.O. July 27. First meeting, O.R.'s, Manchester, August 12, at 2.30. P.E., C.C., Salford, October 7, at 10.30.

J. M. Grant (Acton Concrete Partition Co.), 63, Cornhill, E.C. R.O., July 17. Liabilities, £37,896; £33,257 expected to rank for dividend; estimated net assets, £744. Debtor acquired in 1905 the business of the Acton Concrete Partition Co., with a view to developing the patent. He had no capital, but made arrangements for financing the business, which he was eventually compelled to close in consequence of the action of a creditor. He has also acted as a director of other companies, one of which he formed ten years ago for the purpose of purchasing land and reselling it at a profit to builders. He had put £4,000 into that company, which is now in liquidation. The debtor also acquired land at Wealdstone, which he has developed on his own account, for the purpose of assisting the company last mentioned. In reply to the chairman, the debtor stated that the whole of his liabilities had arisen through his connection with two companies, for which he had given his personal guarantees for over £30,000, and which had been unsuccessful through no fault of his own. At a meeting of creditors held on Thursday last, Mr. A. G. Baxter, chartered accountant, was appointed trustee to administer the estate.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 10 o'clock on Tuesday morning.

A competent architectural assistant (24) desires appointment, permanent or temporary; good designer, accurate draughtsman; constructional details, specifications, quantities, moderate salary.—Box 4484, BUILDERS' JOURNAL Office.

AN Architect renders professional assistance, on Competition or contract drawings for any class of buildings; quantities accurately taken off; moderate terms.—C., 50, Elm Park Road, Finchley, London. 4437

ARCHITECTS' Assistant (20), 4½ years' thorough general experience, good draughtsman and colourist, details, perspectives, specifications, and quantities; first class references and testimonials; salary about 20s.—W. H., care of Hipwell, Surveyor, Chatteris, Cambs. 4456

Cumberland's Compromise.

Cumberland County Council has distinguished itself by creating a somewhat peculiar post, and, with it, a rather pernicious precedent. It has resolved to appoint a "Surveyor of County Buildings and Schools," who is to be made responsible for "the ordinary repairs, alterations, and maintenance of all county buildings, police stations, and schools, and the erection of new buildings, if required." The surveyor is to have £300 a year and reasonable travelling expenses, the Council holding itself responsible for the necessary clerical assistance, at a cost not exceeding £100, and, of course, providing a properly equipped office, as well as defraying all incidental expenses. In short, the surveyor will be paid £300 a year net. That the Council expect him to earn it is quite evident from the terms of the recommendation—"That the said Surveyor be required to devote the whole of his time to the services of the county, and be responsible for the above-mentioned duties, and, in addition, that he prepare and submit plans, drawings, specifications, and estimates, and take out quantities, obtain tenders, and carry out the execution of any new work which he may be required to do by the County Property, the Standing Joint, or the Education Committees, and all plans, specifications, etc., so prepared shall become the property of the County. Where any committee consider that an architect should be appointed for any special purpose, it be left to the committee to employ one upon such terms as they consider necessary." It had been previously proposed to retain a County Architect, but, the Council jibbing at the expense, the present weak compromise is the result. Lord Morpeth, as a member of the Council, very pertinently asked, "Why was the new functionary to be called a Surveyor of County Buildings and Schools, instead of what he must necessarily be—an architect?" Naturally enough, it seemed to his lordship that "the committee had not made up their minds whether they wanted an architect or a clerk of works." That they could not reasonably expect to get, at the price, a satisfactory combination of the two, was rather caustically pointed out by another member of the Council, who supported Lord Morpeth's motion to refer back the recommendation. The cheeseparing and timorous policy, however, was allowed to prevail; and the Council has thereby condemned itself to realise, sooner or later, and with more or less poignancy, that parsimony is by no means synonymous with economy. The Council is indeed sanguine if it expects that £300 a year will obtain the exclusive services of a fully qualified and self-respecting architect. But perhaps it is only looking for a glorified builder's foreman.

Architecture in the East.

In the first of the interesting series of articles in the "Times" on "Archæology in India," to which attention was directed in these columns last week, it is observed that of Hindu architecture there are two distinct types, the Northern or Indo-Aryan, and the Southern or Dravidian, and the earliest examples date from the seventh century A.D. It is characterised by extraordinarily elaborate sculpture. The frieze of the Siva temple at Halebid, for example, contains on its lowest band alone, which rises to a height of barely 1ft. from the ground, a varied procession of at least 2,000 beautifully carved elephants. The writer accuses a former Public Works Department of having, in their zeal for the construction of roads, bridges, and railways, effaced many valuable relics of antiquity in India; so that Fergusson, the great authority on Eastern architecture, sarcastically remarks that the Temple of the Sun, the famous Black Pagoda in Orissa, "seems to have fallen even without the aid of the Public Works Department." Such vandalism, however, is no longer possible, thanks to the Ancient Monuments Act that was passed during Lord Curzon's viceroyalty in 1904. The second article of the series sketches the history of the archæological survey of India, which was reorganized in 1899. In 1902 Lord Curzon appointed Mr. J. H. Marshall to the post of Director-General of the Archæological Department; and as Mr. Marshall is a distinguished Cambridge graduate and a highly trained archæologist, he may be expected to do exceedingly valuable work. In the third article of the series, which appeared in the "Times" of Wednesday last, it is stated that in the United Provinces and the Punjab, "where are to be seen some of the most beautiful specimens of architecture in the world," the work of conservation has been vigorously prosecuted. In Delhi, the correspondent was specially struck by the beautiful restoration which was being carried out by an Italian artist, of the mosaic marble panels in the Hall of Audience, which were originally executed by another Italian, when the palace was built, in the middle of the seventeenth century. In Southern India the stone sculptures in the old temples are found covered with many coats of whitewash, obliterating all details, so that East and West have at least one point in common—the vandalism of whitewashing. These articles may serve as a much-needed stimulus to the study by Western builders of the little-known architecture of the East.

Extending Romsey Abbey.

The application for a faculty to authorise an addition to Romsey Abbey is greatly disturbing the minds of the lovers of ancient buildings. For the famous old Hampshire Abbey it is claimed that it is the only "nuns' church" still in existence in England, and that it probably contains more purely Norman work than any other building in the kingdom. It is therefore easy to understand the alarm that has been caused by the proposal to erect a porch at the north-west door. Those who are applying for the faculty urge that the fabric originally included a porch in this position; but in reply it is contended that the modern work could not be a reproduction of any former work, because there are no plans or drawings in existence that might afford guidance for the design of the new structure. It may be true that the original foundations have been discovered, but these apparently stretch right across the roadway, where building is now out of the question, and the proposed porch would be only 16ft. in length. A twentieth century addition to a twelfth-century building seems to be so daring a proposition that it is difficult to withhold one's sympathy from those who are strenuously opposing it. The Chancellor has wisely decided to defer judgment until October 23rd, and, in the meantime, to fortify himself with the opinion of experts. Sentimentality is apt to run riot against every attempt, wise or foolish, at restoration, but in the present instance it really seems that those who are opposed to the innovation have so good a case that they can well afford to state it temperately and with dignity. This appears, from what we have seen of the controversy, to be exactly the attitude that has been adopted by the opponents of the scheme.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Aug. 31	PARISH CHURCH AT BISHOPS-WEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Road, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Oct. 31	COUNTY HIGH SCHOOL FOR GIRLS, ROMFORD.—Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
No date.	SITE-PLAN FOR COTTAGE EXHIBITION, SWANSEA, 1909. Gold, silver, and bronze medals, together with sums of £20, £15, and £10. Particulars from Henry R. Aldridge, Secretary to Exhibition, 7, Gower Street, Swansea.
No date.	COUNCIL CHAMBERS AT BELLSHILL, BOTHWELL. To cost £2,000. Site plan and conditions from Robert Anderson, Parish Council Offices, Bellshill. Deposit one guinea.

Intermediate School for Boys, Cardiff.

Mr. Leonard Stokes, F.R.I.B.A., of London, the Assessor appointed by the Cardiff Education Authority, has delivered his report on the 34 sets of plans submitted. The first premium (£50) has been awarded to Messrs. Teather and Wilson, of Cardiff, who have been appointed as architects for the work; the second premium (£40) has been given to Messrs. James and Morgan, of Cardiff. The third premium (£30) was awarded to a second set of plans submitted by Messrs. Teather and Wilson, but the premium has not yet been paid over.

New Receiving and Vagrant Wards, Islington Workhouse, London.

The Board of Guardians have provisionally adopted the plans of Mr. William Lockwood, London, for these additions to the St. John's Road Workhouse. Messrs. Greenaway and Newberry, London, were awarded the two premiums of £15 and £10 for the best set of plans out of the seven submitted, but the assessor, Mr. Lewis Solomon, considered that the cost, estimated at £3,350, would be nearer £5,000. The board have, therefore, adopted Mr. Lockwood's plans, subject to approval by the Local Government Board, and to proof, by the architect, that the work can be executed at a cost, as estimated by him, not exceeding £2,000.

County High School, Romford, Essex.

The governors of this school invite competitive designs from architects for a new school, for 200 girls, at Romford. Printed conditions, instructions, and site plan can be obtained from the Clerk to the Governors, 71, South Street, Richmond, on written application to be made by or before August 24, 1908, accompanied by a deposit of £5 5s., £5 of which will be returned on receipt of a bona fide design. The particulars will be posted to competitors on or about August 29. Designs to be delivered by October 31. The deposit conditions appear to be as evil as they well can be. The Governors, in plain words, charge competitors 5s. for the particulars and site plan, and force from them a loan of £5 for over two months. Why? It is idle to say that 5s. will not cover the cost of the particulars and the site plan. There must be 3s. to 4s. profit on each one. So far from deterring applications for these conditions by insisting on a deposit of £5, the Governors ought to encourage them. Applications at, say, 3s. 6d. profit each are not to be despised in these hard times. They might even realise the amount of the premiums. And as the applications must be in by a certain date, the Governors are in no danger of printing more copies than will actually be required. If by this requisition of £5 the Governors hope to eliminate the smaller fry, and limit the applicants to the great and revered heads of the profession, they are doomed to disappointment. They will merely attract the rich architect—which is quite another matter.

Garden Front.

Entrance Front.

"DENHOLME," WALTON-ON-THAMES. WALTER E. HEWITT, A.R.I.B.A., ARCHITECT.

The accommodation in this house comprises on the ground floor, a large sitting-room, hall, dining-room, drawing-room, billiard-room, and the usual offices; on the first floor, eight bedrooms and dressing-rooms, two bathrooms, etc.; and on the top floor, five bedrooms, bathroom, box-room, etc. The exterior is faced with purple clamp bricks of varied colour, with red dressings. The roofs are tiled. The builder was Mr. Frank Hawkey, of 81, Brighton Road, Surbiton, and the Architect, Mr. Walter E. Hewitt A.R.I.B.A., of 22, Buckingham Street, Strand, W.C., who also arranged the laying-out of the garden.

HINTS ON ROUGH-CASTING.

By Ralph Stone.

There is so much bad rough-cast to be seen on buildings, villa property and the like, more particularly in connection with speculative work, that as a result this material is often condemned as a very bad one to build with. As a matter of fact, rough-cast when used can either make or mar a building; a poor building can be made to look well with good rough-cast work, while many good buildings have been spoilt by its application in an ineffective manner. The very nature of the material gives an opportunity to unscrupulous builders for scamping, and it is often used as a cloak to hide a multitude of sins.

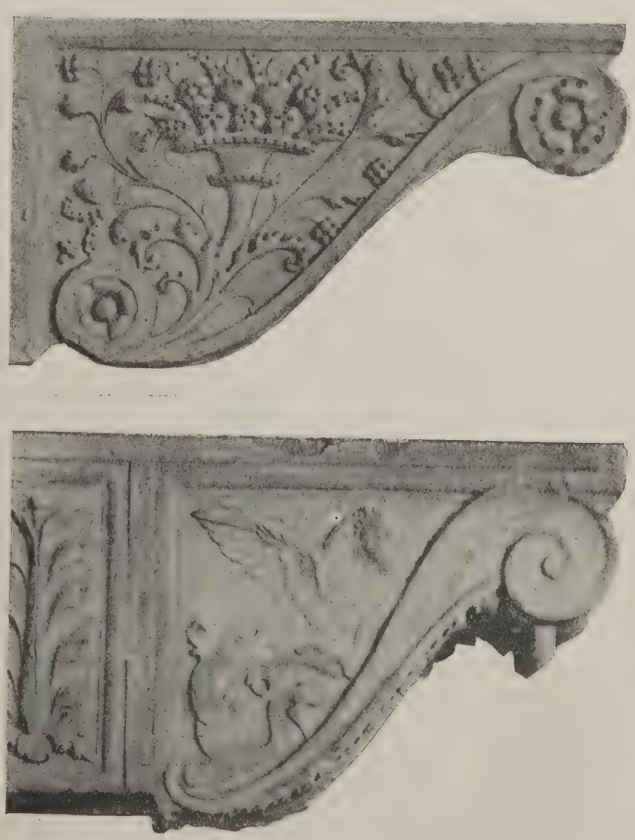
It may therefore, be worth while to mention a few points about rough-cast which are necessary in order to produce good work. In connection with brickwork, both the horizontal joints and the vertical joints of the brickwork should be raked to a depth of about one inch before the application of the covering. In cheap work it is better not to fill in the mortar flush with the face of the brick; both material and time can be saved by building in the usual way and omitting to rake out the mortar, so as to form a key for the rough-cast. The brickwork should be well damped before the first coat of mortar is applied, so that the bricks will not absorb the moisture too rapidly from the mortar. This is more especially necessary when common bricks—which are most porous—are used; and it is, of course, usual for common quality bricks to be used where the surface is to be rough-casted. The effect of omitting to moisten the bricks is to make the coat of mortar dry too quickly and eventually to crack off in large pieces. The first coat should be of a rich lime mortar with a large proportion of hair, and should be mixed a week before using. Immediately after its application it should be scratched in order to form a key for the second coat, but before applying the second layer the first must be allowed to dry thoroughly. When the drying is accomplished, the surface should be sprinkled with water before the second coat is applied. If pebble-dashing is required, the second coat should be so mixed as to dry a little faster, or there will be a tendency for the pebbles to sink when the dashing is being carried on, making unsightly holes after the rough-cast is dried. A point worth noting is that there should be an abundance of pebbles (well washed in order to free them from soil and other earthy matter which would prevent cohesion), and these pebbles should be applied liberally; nothing looks worse than pebble-dashing carried out in a scanty manner. This remark applies also to cases where brick chippings are used instead of pebbles.

This method lends itself to very nice effects where there is a five or six foot plinth of stone-work and rough-cast with brick chippings above. An alternative method to dashing the second coat with pebbles is to apply a third coat in a semi-fluid state composed of gravel or chippings of various sorts, together with lime mortar. This can be made in any colour by the adding of suitable tinting matter, in which case the rough-cast, after application, should be gone over with a brush dipped in the tint in order to obtain a uniform colour.

Rough-casting should not be attempted in frosty weather, and if, when done, it is exposed to brilliant sunshine, a shade should be made to cover the work, or the moisture, which is a great factor in the process of making the mortar set firmly, would be extracted too soon. If a pug mill is not used, great care should be taken in order to keep the mortar free from lumps, as this not only causes inconvenience, but produces a great tendency for the rough-cast to crack and split into pieces.

Sea sand should be absolutely barred, as it attracts damp. On very wet days great patches of white mould will appear, giving a streaky and detrimental appearance to the house. If sea sand is the only kind obtainable, it is preferable to use brick dust, and it does not matter if this is not ground very finely, because the methods of old-time builders have taught us that to a certain degree the rougher the material the more cohesive the effect obtained.

Rough-cast is a very useful material when alterations to a stone house are being carried out. There are, frequently, openings, which, for cheapness sake, can be filled up with brick and covered with rough-cast. It should be remembered that where it is applied to stonework special care must be taken to see that a good key is provided; there is invariably a larger plane surface in stonework than in brickwork, for in the latter one does not generally get a larger plane surface than 9ins. by 3ins. It very much assists the appearance of a building if brick quoins are made to project, the thickness of the rough-cast, at the angle of buildings, windows, etc., and this not only sets off the look of the house, but obviates the difficulty which is often met with in applying rough-cast at angles.



Rough-cast can be made to form remarkably beautiful effects. Hunt, in his book on Tudor architecture, mentions that this composition was sometimes studded with fragments of glass, which made a brilliant display in sunshine and by moonlight. There is no reason why it should not be amenable to a considerable amount of novel and artistic treatment, which would tend to raise it from its present position as a suspicious adjunct to jerry-building.

THE L.C.C. WORKS DEPARTMENT.

The Policy of Municipal Trading.

The London County Council have finally decided to shut down the Works Department, and a committee has been appointed to consider the best means of giving effect to this decision. The Belvedere Road establishment has had a decidedly stormy career. It was started in the teeth of fierce opposition from a minority of the Council, it continued under the cross fires of opposing parties, and became the shuttlecock of political rivals. Quite early in its existence a grave scandal threatened to wreck it, and relentless suspicion on the one side, and blind partisanship on the other, have kept it constantly in a state of turmoil. The decision to end it was reached after scenes as exciting as those that heralded its birth. Now that its operations are to cease, it may be interesting to consider what effect this and similar departments in other centres exercise upon the building trade.

It is obvious that a municipal works department cannot be successful unless it is constantly occupied with plenty of work; and it is equally clear that work cannot, or should not, be created with the sole object of keeping the works department employed. It might be possible for a public department to compete for con-

BALCONY CORBELS IN MARBLE: ITALIAN RENAISSANCE

tracts outside public work; but it is very certain that such a course would be strenuously opposed by the ratepayers (who would have to take the risk of such operations not being profitable), and particularly by those ratepayers who were engaged in the building and contracting trades, and who are forced to pay rates for the purpose of starting and maintaining a formidable competitor against themselves. There is an inevitable temptation, therefore, to keep such a department busy, either by giving it unnecessary work, or by letting it spin out the jobs as long as possible, in which latter case a profit can only be shown by paying much more for the work than its market value. In one or two cases a certain amount of success has been achieved by appointing a capable manager and giving him a free hand—in fact, setting him up in business as a contractor, but at a fixed salary in lieu of profits. With conscientious men, having full powers to engage and dismiss workmen, a profitable department has been made, principally because when work was scarce, or there were no jobs, the men were all or in part paid off. But the protagonists of municipal building departments are not the people who usually pay off a staff; their ideas run more to a staff of permanent employees, and they pay, as a rule, higher wages and exact less work from their men. The temptation to the men to take their time is easily understood; it is part of the self-same policy of keeping their department occupied. Certain it is that the London County Council set a standard of speed for bricklaying that is very far below the capabilities of a competent workman doing good work.

It is almost inevitable that work executed under such conditions will turn out too costly; there is every opportunity for expenses to mount, and no safeguards against it. At the recent conference of the Builders' Federation, held in Birmingham, Mr. Pringle, from Australia, gave some very significant particulars as to direct-labour departments in South Australia. The cost of stonework per foot cube, employing direct labour, was from 10s. to 12s. The architects' estimate for this work was 6s. per foot cube. When, in view of these figures, the city authorities decided to revert to the old contract system, the same work was carried out by a private firm at from 3s. 9d. to 4s., or nearly 75 per cent. less!

The L.C.C. Works Department was first attacked for "cooking" accounts, and on investigation it was found that profits made on one job had been transferred in part to other jobs, upon which the estimates had been exceeded, so that a small profit on every job might be shown. More recently the competitive element in the Department's work was eliminated; the Department took work at the figure estimated for the job by the engineer or architect, and if it considered this figure too low, the work was put out to contract. If the final cost of the completed work came out at less than the amount of the architect's or engineer's estimate, the Department considered that it had saved the ratepayers' money; but it can readily be seen that there can be no guarantee of saving to the ratepayers unless a Works Department tenders in competition with outside contractors.

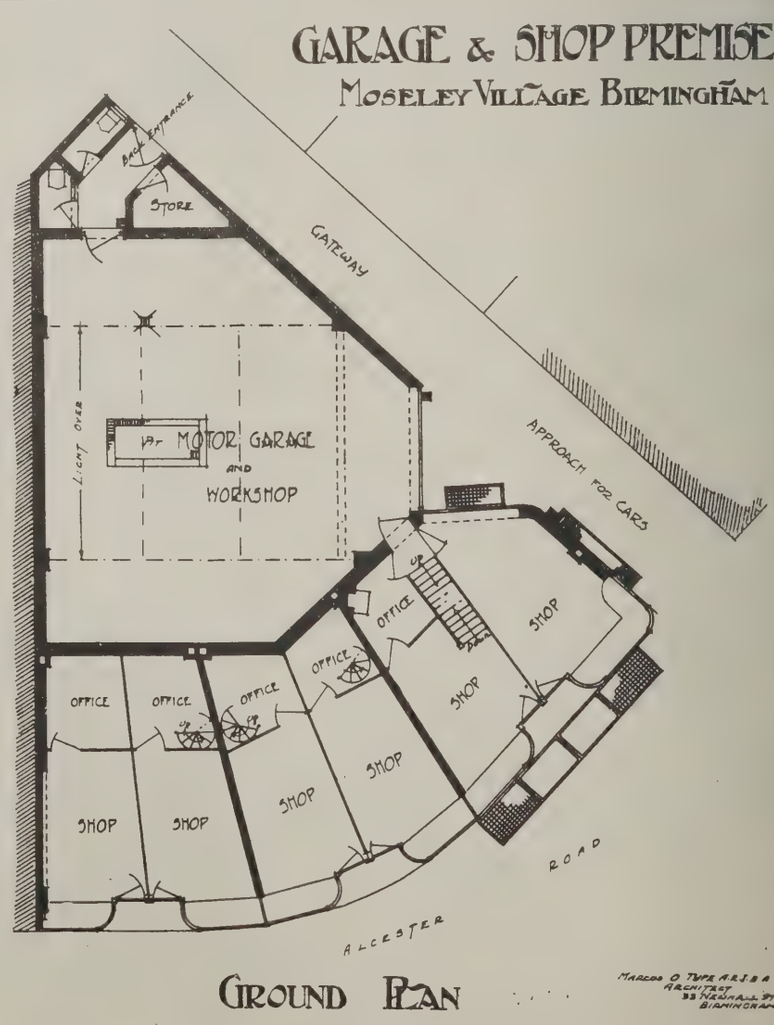
There is some apprehension, now that the Works Department of the London County Council is to be disbanded, that the Council may revert to the old and vicious policy of a "list" of contractors, which means that the particular firms upon the list will form into a ring, arranging between themselves who takes the work, and at what figure. In the matter of contracts there should be a fair field and no favour, and contractors themselves would prefer that it should be so. The very onerous conditions as to contracts and deposits laid down by the Council are amply sufficient to ensure that the work shall be carried out by trustworthy and substantial firms. Hence the list, besides leading to abuses, is entirely unnecessary.

Our Plate.

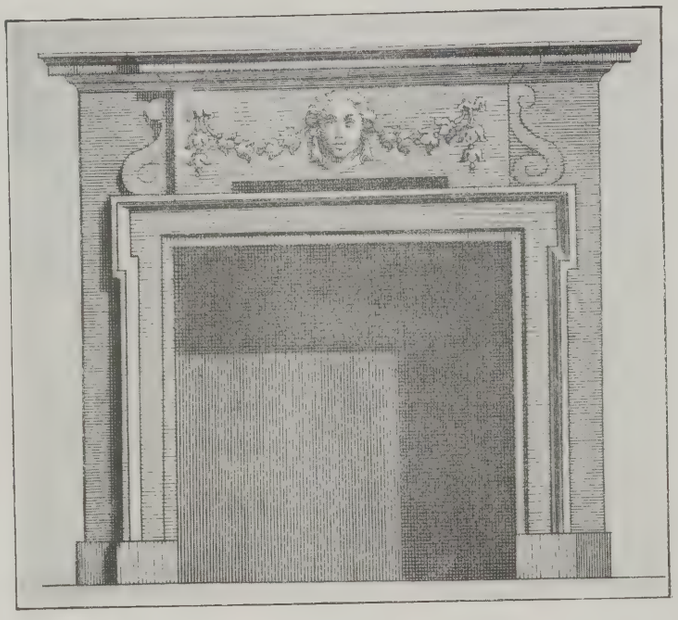
Designs for Chimneypieces, by James Gibbs.

The chimneypieces illustrated on our plate this week are typical examples of the refined and scholarly work of Gibbs, though rather more elaborate in detail than the later Georgian examples of a similar type. The utility of the second, fourth, and sixth chimneypieces would be doubtful at the present day, owing to the absence of shelf accommodation, and the brackets in the second, third, and fifth examples look rather heavy over the architrave mouldings below them. It is worthy of note that the later Georgian architects refrained from making the chimneypiece an aggressive feature in the room, a defect that is too often apparent in modern interiors, considering that the grate is out of use for several months in the year.

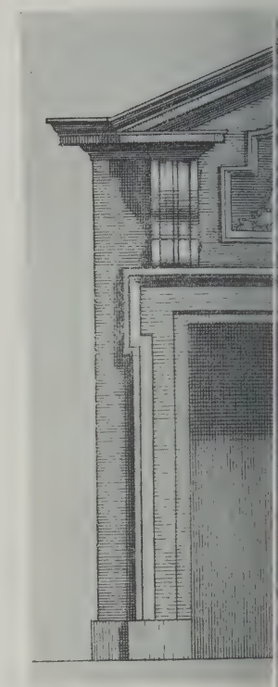
Notes and News.



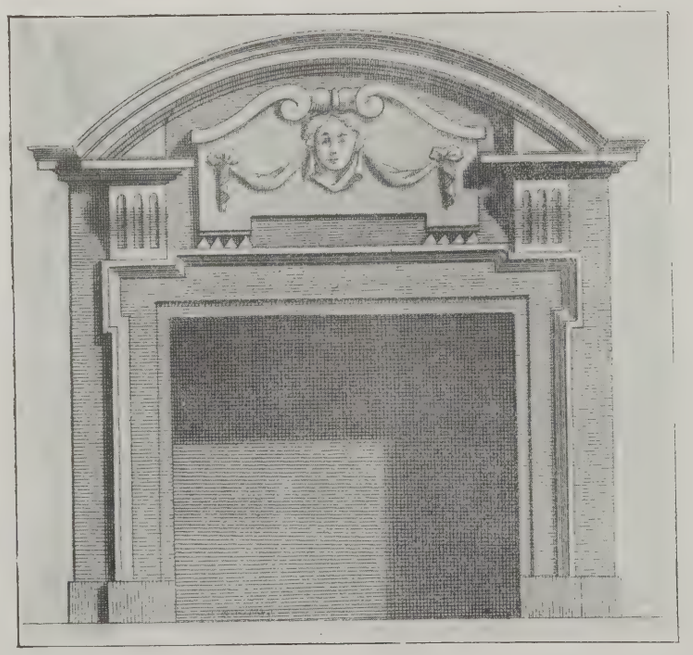
THE SYNCHRONISATION OF CLOCKS is being energetically advocated by the Executive Committee of the British Science Guild, who point out that there is no general system for providing the public with exact standard time. The Guild will ask the Local Government Board to pass a by-law compelling the synchronisation of public clocks.



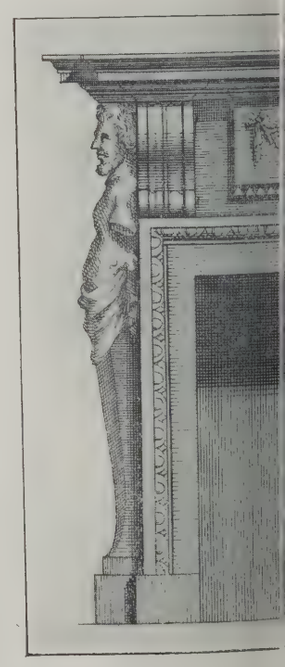
* * *



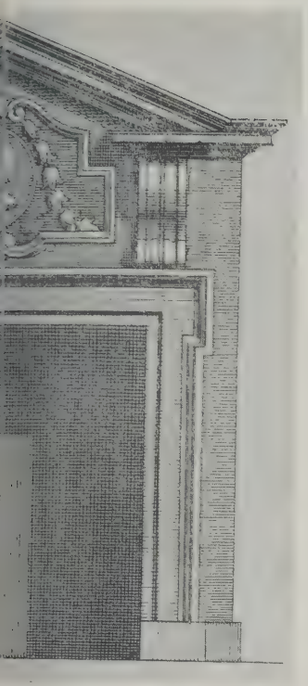
THE NEW NAVE OF HEXHAM ABBEY, which was consecrated on Saturday week, was designed by Mr. Temple Moore, F.R.I.B.A., and, with other works of restoration, has cost about £30,000. The Abbey church was built, it is believed, at about the beginning of the thirteenth century, and it stands on the site of a church that was destroyed by the Danes in 875 and 995, and was partly restored in the latter part of the eleventh century.

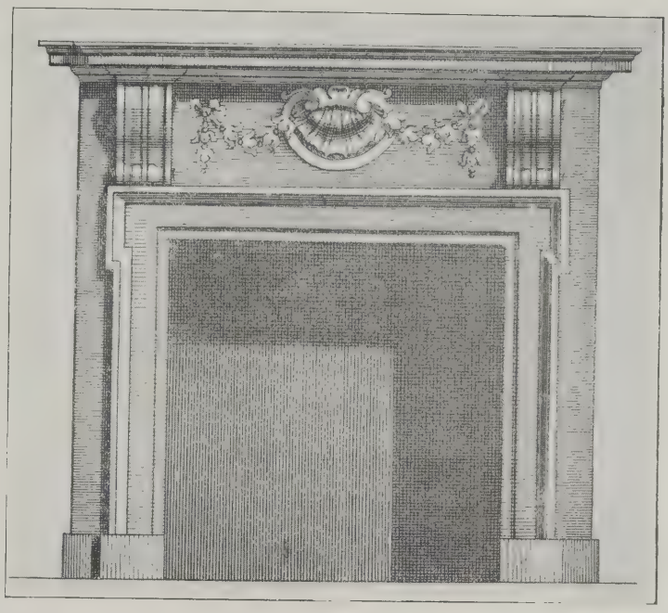


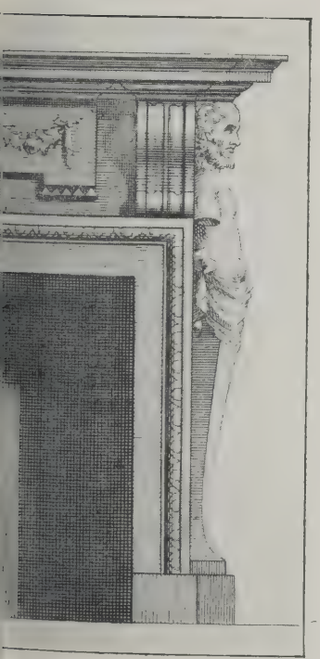
* * *

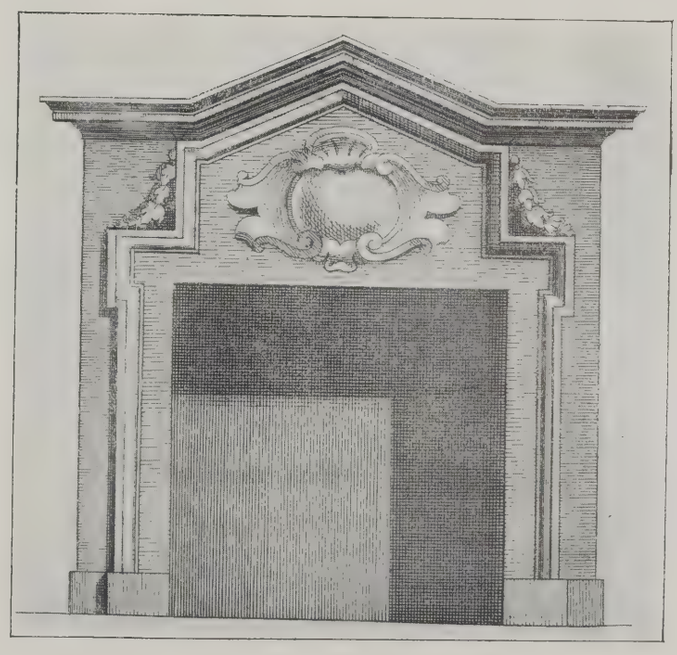


A MEMORIAL PULPIT that has been erected in the parish church of St. James, Benwell, Newcastle-on-Tyne, to the memory of the late Bishop Lloyd, has an alabaster base, while the upper part is of oak. There are four panels, illustrating, respectively, the lifting up of the serpent in the wilderness, the baptism of our Lord, the call of St. James and St. John, and the Great Commission. At the four corners are figures of Moses, Elijah, St. James, and St. John. The other panel









DESIGNS FOR C

S, BY JAMES GIBBS.

GARAGE AND SHOPS, MOSELEY VILLAGE, NEAR BIRMINGHAM. MARCUS O. TYPE, A.R.I.B.A., ARCHITECT.

ars the initials of the donor (Miss isten) and of the late bishop. Above e pulpit is a figure of the crucified ord, beneath which is the last text ven by Bishop Lloyd—"God so loved e world."

* * *

SOME UNUSUALLY CHEAP COTTAGES are ing built, it is stated, in Sheffield, by . A. J. Brown, of Grimesthorpe, the t price being about £160 per house. A teworthy feature of these houses is the h arrangement, which is on a special n, patented by Mr. Lancaster, of ndon. The bath itself is in the kit-n, covered, when not in use, by a rd which makes a serviceable table. e ordinary cistern is done away with, l, by a very ingenious arrangement, its ce is taken by the domestic set-pot. e water for all purposes can be heated ter from the living-room fire, or by a under the set-pot, so that there is ays available a plentiful supply of hot er at a minimum cost.

* * *

'ROPOSED ADDITIONS TO MAGDALENE LLEGE, CAMBRIDGE, will comprise a new g with a frontage to the river, new eping-rooms," and a large lecture tre. Excavations for the work are in progress.

* * *

TURKISH PARLIAMENT HOUSE, which, ording to last Wednesday's news-ers, the Sultan had offered to build, be the first important material mani-ation of the new spirit in that country, architects are naturally very curious ee what shape it will take—whether design will be traditional, modern, or a compromise between old and new or East and West.

* * *

THE REMOVAL OF THE IMPERIAL THEATRE, which adjoins the site of the old Royal Aquarium, Westminster, is now being very rapidly accomplished. The building, it is said, is being taken down in sections, for re-erection on another site about a dozen miles away, the material being stacked away, so that in about seven months' time it will be seen again exactly as at Westminster. Possibly this statement was suggested by the decision to re-erect Crosby Hall in Chelsea. It is probably only the interior decorations, such as the costly marble slabs and the huge mirrors, that are being stored in the manner described.

* * *

PONTYPRIDD MASTER BUILDERS' ASSOCIATION, which is affiliated to the South Wales Federation of the National Federation of Building Trades Employers of Great Britain and Ireland, report, through the local secretary, Mr. Alfred W. Julian, that the day of meeting of this association has been altered from the first Saturday in the month to the last Monday, and the time of meeting to 8 p.m., instead of 7 p.m.

* * *

AS A MEMORIAL TO THE LATE MR. G. F. BODLEY, R.A., who died on October 21st, 1906, an ante-chapel, built from one of the last designs prepared by Mr. Bodley, has been added to the church of the Holy Angels, Burton-on-Trent, and was on August 12th dedicated by the Bishop of Lichfield. The work has been carried out by Mr. R. Bridgeman, of Lichfield. The church to which the ante-chapel has been added was the work of Messrs. Bodley and Garner.

* * *

MR. JAMES DENVER has been appointed secretary to the Northern Centre of the National Building Trades' Employers' Federation of Great Britain and Ireland. The appointment was made at the half-yearly meeting of the Council, held recently in Birmingham.

* * *

THE NEW SOUTH PARADE PIER AT SOUTHSEA, which was ceremonially opened by the Mayor of Portsmouth on August 11th, is 610ft. long, and varies in breadth from 72ft. to 147ft. The various buildings include an entrance hall, measuring 54ft. by 34ft., a tea-room, and a skating-rink or small concert hall. The pavilion provides seats for 1,100 persons on the ground floor and 600 in the balcony. The work has cost about £70,000. The architect is Mr. G. E. Smith, and the contractor Mr. T. H. Yelf.

* * *

A NEW CHURCH FOR LITTLEHAMPTON, of which the foundation stone has just been laid, will, when completed, provide accommodation for 666 persons, and the cost is estimated at £9,500; but at present only the nave, south aisle, and porch, are to be finished, at an expenditure of about £3,000. The building is to be in the Decorated style, and is to be constructed of dark red bricks and flints with stone dressings. It will be faced internally with red brick and stone dressings.

PROPOSED NEW WORKS.

The Local Government Board has recently held, or has decided to hold, inquiries into proposed expenditure by public bodies as follows:—Electricity supply and plant, Kingston-upon-Thames Borough Council, £12,600 (August 18). Water-supply works and plant, Runcorn Rural District Council, £400 for township of Frodsham and £200 for lordship of Frodsham (August 20); Conway Rural District Council, £1,000 for Llansaintffraid (Aug. 18). Sewerage, drainage, sewage disposal works, and plant, Caversham Urban District Council, £255 and £650 (August 19); Hastings Borough Council, £1,175 (Aug. 21). Street improvements, new roads, pleasure grounds, and public walks, Caversham Urban District Council, £105 and £275 (Aug. 19); Abercarn Urban District Council, £5,340 (Aug. 21); Swansea Borough Council, £6,000 and £600 (Aug. 19). Various, Manchester City Council, £1,500, site for baths (Aug. 21); Clacton Urban District Council, £200 for cliff improvement.

Beverley Town Council have appointed a committee to inquire into the necessity of building municipal offices on the site adjoining the free library.

With respect to the proposed Carnegie Library for New Mills, Lancs., a subcommittee has been appointed to inspect suitable sites and report to the New Mills Public Free Libraries Committee.

Messrs. Lipton are about to start several refreshment shops in London, where it is expected that twenty will be opened before the end of the year. If the adventure is successful, it will be extended to the provinces.

Harecourt Chapel, Canonbury, which dates from the days of Oliver Cromwell, who was associated with the building, is to be restored and re-decorated in accordance with a scheme that has been prepared by Mr. George Carter.

It has been decided to build an abbey in East Dulwich. The Emperor Francis Joseph, and many members of the Austrian nobility, are contributing towards the cost, in response to an appeal by Dom Fultor, O.S.B., the rector of a Catholic mission in Lordship Lane, S.E.

Further work immediately required at York Minster includes attention to the window mullions throughout the building, and the provision of a suitable pulpit. The estimate for absolutely necessary work that ought to be done without delay is £600.

Mr. J. J. Burnet, A.R.S.A., Glasgow, has submitted to the directors of the City and County (Perth) Royal Infirmary a report, with plans showing a new infirmary to contains 100 beds, and estimated to cost £50,000. The directors postponed consideration of the report, and resolved to invite Mr. Burnet to a conference on the subject.

It has been decided, at a special meeting of Alton Urban District Council, to build a convalescent home and an isolation hospital. The site for the home has been selected, and the surveyor has been requested to prepare plans and estimates for the hospital, which are to be submitted to the Local Government Board, whose sanction is to be sought for a loan of £5,000.

Bangor City Council have decided to adopt Mr. Gill's plans for a museum addition to the library buildings, and to invite tenders from local contractors only. A councillor objected to the floor of the museum being on a lower level than the floor of the library, as he thought that people would not care to go downstairs to inspect the exhibits, but his motion on the subject was ruled out of order.

Views and Reviews.

Modern Steam Heating of Buildings.

"Baldwin on Heating," having been first published in 1878, and being now in its sixteenth edition, may be fairly regarded as being entitled to the rank of a standard treatise of approved merit and substantial value. Former so-called editions, however, were but little more than reprints, with corrections, but without revision. The present issue is a real "edition," bearing evidences of drastic general revision, and including facts relating to the principles of modern steam fitting, which useful industry has now, it is claimed, "risen to the dignity of a branch of engineering science that may be known as domestic engineering, and that includes substantially all that goes to make up the engineering plant of a modern city building, except the electric light and elevator systems, which do not properly belong to the subject." The arrangement is so systematic, and the style so terse, that, in spite of the expansiveness of the subject, the book is of quite handy size, and might even be accommodated in one of the fairly capacious pockets that the heating engineer occasionally affects. The principles are enunciated with remarkable clearness, and the practical details are plainly and comprehensively described and copiously illustrated.

*Baldwin on Heating; or, Steam Heating for Buildings Revised. By William J. Baldwin, M.Am.Soc.C.E., etc. Sixteenth Edition, revised and enlarged 12mo. viii.+404 pages, 143 figures, and 15 plates. Cloth, 2 dols. 50 cents. (10s. 6d. net). New York: John Wiley and Sons. London: Chapman and Hall, Ltd.

The Priory Church of St. Bartholomew, London.

The most ancient, and in many other respects the most interesting, church in London, that of St. Bartholomew-the-Great, has been the subject of many monographs. The latest is an addition to Messrs. Bell and Sons' cheap and useful, but some what arbitrarily named, "Cathedral Series." The author, Mr. George Worley, has made a conscientious study of the venerable Smithfield church, and has succeeded in presenting a thoroughly interesting account of this remarkable relic of the twelfth century. Rahere, the founder of the church and priory, died in 1144. Thomas of St. Osyth, the second prior, who died in 1174, built the transepts and the easternmost bays of the nave, which was probably completed during the succeeding half-century, as its fragmentary remains reveal the Early English style. Roger de Walden, Bishop of London (1405-1406), introduced Perpendicular work when he built a chantry chapel to the north-east of the choir, inserted a new clerestory, and substituted a square east end for the circular apse. The Lady Chapel dates from about 1410, when also, probably, the central tower was rebuilt. The Dominican Order of Black Friars, introduced by Queen Mary, had begun to rebuild the nave, when, on the accession of Elizabeth, they were expelled, and the church was in considerable danger of destruction, Bishop Grindal even proposing to take off the roof-lead and transfer it to St. Paul's Cathedral. How the building was subsequently hemmed in and encroached upon by modern factories and other buildings is a matter of recent history. The real work of restoration was begun in 1863 by the Rev. John Abbiss and the Rev. F. Phillips, was continued by the Rev. William Panckridge, and was greatly advanced by the Rev. Sir J. Borradaile Savory, Bart. The crowning work was the reconstruction of the Lady Chapel, under the direction of Sir Aston Webb, R.A. This work was completed in 1896. Mr. Worley's interesting and valuable little monograph is well illustrated with views and plans.

*The Priory Church of St. Bartholomew the Great, Smithfield. A Short History of the Foundation and a Description of the Fabric, and also of the Church of St. Bartholomew the Less. By George Worley. With 42 illustrations. 1s. 6d. net. London: George Bell and Sons.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Architect's Liability as to Contract.

LEEDS.—R.S. writes:—"A joiner has a contract for two houses. When about two-thirds of the work has been done, the architect, acting under the contract agreement (R.I.B.A. form), gives him notice to leave the job, and, at the urgent request of the proprietor, puts on another contractor (recommended by the proprietor) to rectify and complete the work. The payment throughout the job is to be up to 80 per cent. by certificate of work done, according to the clause in the R.I.B.A. contract, but the architect, when the first joiner was dismissed, withheld about 40 per cent. of the alleged value of work done as priced out on the contractor's schedule. Is the architect under any liability to the proprietor to complete the work within the amount of the first contract?"

The architect has no personal liability in the matter at all, as there cannot be any charge of negligence brought against him. The first contractor, having undertaken to complete the work in a certain way, and to the satisfaction of the architect, is the person who is liable for the work—he has contracted to deliver a certain article, complete, and as the conditions of contract permit of the action which has been taken by the architect, I am of opinion that any difference in cost is legally recoverable from the original contractor. X.

Fees for Disposal of Leases.

BRIDPORT.—PRO BONO PUBLICO writes: "(1) What is the latest authentic scale of fees payable to architects and surveyors for disposing of leases, or an unexpired term of a lease, by private contract? (2) Would the fees for architects and surveyors be the same as allowed for auctioneers and estate agents? (3) What amount is an architect and surveyor entitled to charge in the following instance? A lease of some property contained the following conditions. (The lease was disposed of by private contract.)—(a) The lessee to keep in a thorough state of repair the premises, both internally and externally. (b) The lessee to lay out in improvements a sum of at least £75. Prior to the lease of the premises being assigned, the dilapidations were valued by the surveyor at £125. Several offers were received, the highest accepted amount be

£800. As the conditions contained in the assignment provided for the purchasers to take over all liabilities expressed in the lease, I shall be glad to know whether the surveyor is entitled to charge on the £800 actual sum paid, and on £125 amount of liability for dilapidations transferred by the assignment (with a separate fee for valuing dilapidations), and upon the £75 liability of improvements also transferred to purchasers by assignment."

(1) The Royal Institute of British Architects sanctioned a schedule of charges for professional work at a general conference of architects of the United Kingdom held in 1872, and that schedule, though not legally binding, is usually accepted as being a fair one. (2) The Surveyors' Institution has also dealt at various times with the same subject, but has not, I believe, issued a public pronouncement upon it. (3) For valuations the recognised charge is 1 per cent. on the first £1,000, and one-half per cent. on the remainder, up to £10,000. Below £1,000, such a fee would not prove remunerative, and a special charge should be agreed upon. I should suggest that in this case the fair thing is to make two charges, one based upon the £125 at which dilapidations were valued, and the second upon the £800 obtained for the lease. "Ryde's Scale" gives 5 guineas as the correct fee in the first case, and 16 guineas for the second, out-of-pocket expenses being additional. X.

National Fire Protection Association.

NEWRY.—E.H. writes: "Can you give me the address of the American Fire Prevention Association?"

There is no such association. We presume, however, you mean the National Fire Protection Association, the address of which is 382, Ohio Street, Chicago, U.S.A.

Stresses in Peculiar Roof Truss.

LONDON, S.W.—W. L. writes: "The accompanying sketch (Fig. 1) represents the truss of a shed, each member of which is constructed of steel angles. It is a form largely used in Germany. The feet of the standards simply rest on concrete bases. Please show the form of stress diagram and funicular polygon such a truss would produce under its own load, combined with that of the wind. The situation is a field, neither specially sheltered nor specially exposed. The principals are 12ft. apart. The vertical load consists of a lantern (continuous), slate sides, and its own weight."

Taking the dead weight as being 16-lbs. per sq. ft. of ground plan, the total weight is 3.42 tons, this being distributed on the truss as shown by the vertical forces on Fig. 1. Adopting a wind pressure of 40-lbs. per sq. ft. of vertical surface, blowing on the side shown, the forces due to the wind come as shown horizontally and inclined. The two inclined forces of 1.15 tons are for the wind on the lantern. The accurate method of finding the forces due to the wind is explained in Charnock's "Graphic Statics," Vol. 1, Sheet 33. The reactions at P and Q have first to be determined; and before this can be done we must make some assumption as to the relative amounts of the horizontal forces carried at P and Q. We will assume that the end Q takes no horizontal force—not because it may not in the actual case, but because by so doing we shall get the maximum possible stresses that can occur. It must be remembered that the stresses in the truss depend very much on the relative amounts of the horizontal force carried by the ends. We next set out the forces on a vector line 1, 2, 3, 4, 5 (Fig. 2); 1, 2 being the resultant force on the node ABC21, and so on; and taking any pole X and starting at the point P, we draw the funicular link polygon P*rstu*, the force lines shown dotted being parallel to 1, 2; 2, 3, and so on. Drawing a line through X parallel to the closing link P*u* to meet the vertical through 5, we get the point 6, from which the reaction at P and Q can be found, and which enables us to draw the reciprocal or stress diagram. To obtain the latter, we draw 1a parallel to 1A on the frame diagram, and 6a parallel to 6A, thus obtaining the point *a*. The points *b*, *c*, *d*, *e*, *f* are obtained in the ordinary manner without much difficulty.

The point *g* coincides with *f*, and *j* and *h* with 6. If it is desired to make the assumption—as is done by some writers—that the reactions Rp and Rq are parallel, we join 5, o on the vector figure, and draw RQ parallel to it. The link polygon is then drawn as before, but the link *tu* will be different, and will probably have to be produced backwards, the point where the line through X, parallel to the closing link Pu cuts 5, o will give the point 6, from which the stress diagram is obtained. It will be found that this gives much smaller stresses than on our assumption; and although it is more likely that the reactions will be equally inclined than that Rq is vertical, since the latter is a possible case and gives much higher stresses, it is safe to adopt it. A.

CONTRACTORS' SECTION

(MONTHLY).

THE BUILDING OPERATIONS AND ENGINEERING WORKS BILL.

The above-mentioned Bill, which has now passed its first reading, is the outcome and necessary sequence of the Report of the Departmental Committee on Building Accidents, which was reviewed in our columns in January last. A question put to Mr. Gladstone in the House of Commons a short time ago as to future steps in dealing with dangerous building operations elicited the reply that before regulations could be made further legislation was necessary. This Bill is evidently what was referred to.

The intention of the Bill, it is stated, is to make better provision for the health and safety of persons employed in certain building operations and engineering works and purposes connected therewith.

Its scope is set forth in six clauses and two schedules, and may be considered largely a re-arrangement of certain provisions contained in the Factory and Workshop Act, 1901, and a modification of Sections 4 and 5 of the Notice of Accidents Act, 1906.

The Factory Act above referred to applies to buildings only to a comparatively small extent. Section 105 of the Act, which, in the Bill, it is proposed to repeal, states the provisions that apply. The following is a summary of these :—

Section 17. Under this section a magistrate may, on an application by an inspector, and, being satisfied that any part of the ways, works, machinery, or plant is dangerous to life or limb, prohibit its use until alteration or repair is made. This will remain in force under the Bill.

Section 19 has been replaced by Section 4 of the Notice of Accidents Act, 1906. A modification of this is again proposed by schedule in the Bill, the differences being shown in the following comparison. All deleted portions of the section are printed in italics, and the proposed replacements (where any occur) are shown in the opposite column. Section 5 of the Accidents Act is also dealt with, commencing at paragraph 6 in the schedule. The alterations to both sections 4 and 5 are here shown.

"Notice of Accident Act, 1906."	
Section 4 (1) Where an accident occurs *in a factory or workshop* which is either—	on any premises on which any building operation or engineering work is being carried on
(a) An accident causing loss of life to a person employed in the *factory or workshop*; or	"on the operation or work"
(b) An accident due to any machinery moved by mechanical power, or to molten metal, hot liquid explosion, escape of gas or steam, or to electricity, and so disabling any person employed *in the factory or workshop* as to cause him to be absent at least one whole day from his ordinary work; or	"on the operation or work"
(c) An accident due to any other special cause which the Secretary of State may specify by order, and causing such disablement as aforesaid; or	
(d) An accident disabling for more than seven days a person employed *in the factory or workshop* from working at his ordinary work, written notice of the accident in such form, and accompanied by such particulars as the Secretary of State prescribes, shall forthwith be sent *to the inspector of the district, and also in the case of the accidents mentioned in paragraphs (a) and (b) of this sub-section, and (if the order of the Secretary of State so requires), specifying the special cause of accidents mentioned in paragraph (c) to the certifying surgeon of the district.*	"on the work or operation" "in the case of a building operation to the district council, in the case of an engineering work to the inspector of the district."
(2) If any accident causing disablement is notified under this section, and after notification thereof, results in the death of the person disabled, notice in writing of the death shall be sent to the *inspector* as soon as the death comes to *the knowledge of the occupier of the factory or workshop.*	"district council or inspector" "his knowledge by the person undertaking the building operation or engineering work.
(3) If any notice with respect to an accident *in a factory or workshop* required to be sent by this section is not sent as so required, *the occupier of the factory or workshop* shall be liable to a fine not exceeding ten pounds.	"the person undertaking the building or engineering work.
(4) If any accident to which this section applies occurs to a person *employed in a factory or workshop, the occupier of which* is not the actual employer of the person killed or injured, the actual employer shall immediately report the same to the *occupier*, and in default shall be liable to a fine not exceeding five pounds.	"employed on a building operation or engineering work the person undertaking which "former"
(5) *The foregoing provisions of this section shall be substituted for section 19 of the Factory and Workshop Act, 1901.*	(5) The district council to which a notice is sent under this section shall forthwith forward a copy of the notice to the Chief Inspector of Factories at the Home Office, London.
Sec. 5 (1) If the Secretary of State considers that, by reason of the risk of *serious* injury to persons employed, it is expedient that notice should be given under this Act in every case of any special class of explosion, fire, collapse of buildings, accidents to machinery or plant, or other occurrences *in a mine or quarry, or in a factory or workshop, including any place which for the purpose of the provisions of the Factory and Workshops Act, 1901, with respect to accidents, is a factory or workshop, or is part of a factory or workshop*, the Secretary of State may by order extend the provisions of this Act requiring notice of accidents to be given to *an inspector* to any class of occurrences, whether personal injury or disablement is caused or not, and where any such order is made, the provisions of this Act shall have effect as extended by the order.	"on premises on which any building operation or engineering work is being carried on.
(2) The Secretary of State may by any such order allow the required notice of any occurrence to which the order relates, instead of being sent forthwith, to be sent within the time limited by the order.	"a district council or inspector."

Sections 21 and 22 deal with inquests and formal investigations of accidents. It is proposed that these shall remain in force.

Sections 79-86 give power to the Secretary of State to make regulations for dangerous trades, and state the procedure to be taken when doing so.

Definitions of "Building" & "Engineering" Works.

For Section 79, it is proposed, Clause 1 of the Bill shall be substituted; it simply gives power to the Secretary of State to make such regulations as appear to him reasonably practicable for securing the health and safety of persons employed in building operations and engineering works. Building operations are defined in Clause 5 of the Bill as the construction, repair, or alteration of a building and the preparation for, and laying the foundations of, an intended building; but this definition does not include any operation which is an engineering work. This latter expression means the construction of a railway, tramroad, or tramway, and the construction, repair, or alteration of any harbour, dock, inland navigation, tunnel, bridge, viaduct, sewer, gas work, waterwork, or other work authorised by any local Act of Parliament or Provisional Order, or order having the force of an Act of Parliament.

So far as building operations are concerned, it will be noticed that the Bill is applicable to all classes of buildings whether machinery is used in their construction or not, and whether or not they are over 30ft. in height, and being constructed by means of scaffolding; these being limitations which now exempt a large proportion of erections.

Sections 80-86 will still remain in force and so will section 119, which gives power to the factory inspectors to inspect buildings, with the proviso that where references are made to the Secretary of State and to inspectors, there shall be substituted respectively references to the district council and to surveyors or other officers employed or appointed by the district council for the purposes of the Bill.

Section 136 also stands. It provides for fines in case of death or injury.

Clause 2 of the Bill, which re-enacts the sections of the 1901 Act, just considered with their modifications, also arranges that certain other sections shall apply.

Section 11 is now specially mentioned. It refers to the inspection of steam boilers and, as a matter of fact, has always applied to buildings, in common with other places within the scope of the Act.

Section 73, which makes necessary the notification of lead poisoning, is put in force, and in engineering works it is e

tended to cover the notification, in like manner, of compressed air illnesses.

Register to be Kept.

Sections 128-129 provide that an abstract of these provisions must be affixed and a general register kept. Clause 5 of the Bill states this more extensively :—

Such of the provisions of the Factory and Workshop Act, 1901, applied by this Act as require general registers to be kept and copies of the prescribed abstract and regulations to be kept posted up on the premises when building operations are being carried on, shall be deemed to be complied with if the general register is kept at an office of the person undertaking the operations and copies of the abstract and regulations are kept posted up at each office, yard or shop of the person undertaking the operations at which persons employed by him on the operations attend, and in a position where they can easily be read by such persons.

Powers Given to Local Authorities.

The portion of the Bill, however, which will attract most attention is found in Clause 3. It provides that in the case of a building operation it shall be the duty of the district council to see that the provisions of this Act and of the regulations made thereunder are observed: provided that inspectors appointed under the Factory and Workshop Act, 1901, shall have similar powers of entry and inspection in the case of building operations as are conferred on them in the case of a factory by section 119 of that Act, and if it appears to an inspector on any inspection that any breach of the provisions of this Act, or of any regulations made thereunder, is being committed in respect of any building operation, he shall give notice in writing thereof to the district council in whose district the premises in which the building operations are being carried on are situate, and it shall be the duty of the district council to make such inquiry into the subject of the notice, and take such action thereon, as seems to that council proper for the purpose of enforcing the law, and to inform the inspector of the proceedings taken in consequence of the notice; and where such a notice has been given, and proceedings are not taken within a reasonable time, the inspector may take proceedings in manner provided by sub-section (3) of section 5 of the Factory and Workshop Act, 1901, and that sub-section shall apply accordingly.

All fines imposed in any proceedings instituted by a district council in pursuance of their powers and duties shall be paid to the district council, and carried to the credit of the fund out of which the expenses incurred by the council under this Act are defrayed.

Building operations in this country, and largely so in Scotland, so far as the welfare of the workmen is considered, are at present placed under the control of the Home Office, the executive power being in the hands of the Factory Department. The Committee previously referred to considered this matter as a side issue to their more important duties in drafting rules for safety. On the whole, it was found that the workmen were almost entirely in favour of the controlling power remaining with the Factory Department officials, and in this view a large number of the employers joined.

The Two Points of View.

The men based their opinion upon the idea that the Factory Department, being composed of officials above the danger of local influence, would carry out safety regulations with an even consistency. Those of the employers who were not of this view thought that the local officials, in the form of the district surveyors, building inspectors, etc., formed an already existing staff which was at present dealing with buildings, and could be trusted to carry out extra duties satisfactorily. Much can be said for both these opinions. In the first place the Factory Department is undoubtedly the stronger body, and, provided that the staff is increased sufficiently, and has knowledge of the trade, no objection could be made to it on the score of personnel. The use of the local officials could not be gained more cheaply; an added importance to their work would probably mean increases in the salaries paid. To the ordinary citizen it would make little difference whether he were burdened with the expense either by rates or by taxes.

A compromise might be effected between the divergent opinions by an arrangement of special and direct Home Office supervision of the local authorities. It would be a check upon laxity, and the standard of efficiency, being set up by a central authority, would probably result in a greater uniformity of action than where, for various reasons (local influence being one), the administration depends upon the differing views existing in separate localities. It would mean dual control which the master builders—with reason—would probably object to.

The building trade is not confined to any one locality, neither is a builder to any one district; therefore uniformity of procedure is of extreme importance, and this argument favours the central authority. The dual control is conducive to friction, which it should be the aim of those concerned to avoid. These views will probably be submitted to the Home Office before the Bill finally becomes law, and perhaps, as in this case both the employers and the workmen favour the central and single authority, means will be taken to give effect to their desires.

Market Reports.

The Timber Trade.

Messrs. Denny, Mott and Dickson, Ltd., report that business in hardwoods during July has been dull, and no change is anticipated until the holiday season is more advanced. The teak trade has been very quiet, but the better class of mahogany has been in some demand, and figured logs have realised good prices. There is an excessive supply of small and inferior wood, for which there is small demand. In the soft wood market Messrs. Churchill and Sim report no improvement during July. The supplies have been larger, and the excess quantity is to a considerable extent made up of most inferior quality stuff, for which there is practically no market. The market has been disappointing, and the London demand poor.

The Slate Trade.

The Welsh slate trade has probably never experienced a more severe depression than that which it is now enduring. The demand has fallen off, wages have been lowered, and "short time" is in force at most quarries. It has been suggested that the vogue for tile roofs, especially in the country, is responsible for the falling demand. But the trade itself generally attributes the trouble to the Penrhyn strike, which gave the foreigners a chance to exploit the market. Unfortunately the depression in the trade has attracted the notice of the Tariff Reform and Free Trade political organs, and is now the subject of polemical activity.

SOILS & SUB-SOIL DRAINAGE OF BUILDING SITES.

By Malcolm B. Bennett.

The healthiness of a town depends to a very large extent upon the nature of the soil, chiefly as regards its porosity and permeability. Examining the data given by eminent sanitarians, it would appear that there are very few absolutely unhealthy soils, provided they are natural and not artificially formed, or not polluted from some external source. But there is no doubt whatever that some are much more healthy than others.

Generally speaking, the healthiest soils are those which are the driest, and, as a rule, these are the most porous. On the power to absorb heat, which varies considerably with different soils, depends the amount of moisture a soil will retain.

As a rule, sandy soils warm more rapidly and retain heat longer than do others. The varying power of soils to absorb and retain heat may be stated to be in the following order: sand, gravel, marl, chalk, loam, and clay. The last-mentioned warms very slowly and loses heat rapidly. It will be seen that those soils which retain moisture are the coldest on account of the slowness with which water absorbs heat. Although those soils which are the most porous are generally the driest, they are sometimes found to be saturated with moisture, this being due to an impervious stratum below in the form of a shallow basin which holds up the sub-soil water, and unless this is enabled to drain off either naturally or artificially, the soil above will always remain damp, unless the impermeable stratum happens to be at a considerable depth.

The interstices of all soils are generally filled with what is known as "ground air" at the surface and with "ground water" below. Upon the rise and fall of this "ground water," caused by a heavy rainfall, the "ground air" in the pores of the soil above responds with a similar movement, the rising water driving out the ground air; which may also be extracted in consequence of heightened temperature or decreased atmospheric pressure. Ground air is always very impure owing to the decomposition of organic matter, generally of a vegetable nature, or sometimes of a fouler origin, such as manure, matter from cesspools, or a defective drain. It is also highly charged with carbonic-acid gas, being about 250 times richer in this gas than is the atmosphere. It will thus be seen how easily this ground air might become a source of danger by being extracted from the soil beneath a house on account of the artificial heat generated therein, or by other means, were not the whole of the building site covered with a layer of good concrete or other impervious material as is required by the model by-laws.

The importance should be realised of obtaining a site for building purposes, which combines the advantages of dryness and warmth together with plenty of light and air. The first may be ensured by selecting a soil of a gravelly or sandy nature of considerable depth, and with the lower impervious stratum at a slope sufficient to cause natural drainage and not retain the ground water.

Clay, although it forms a good foundation, is not healthy for a building site, on account of its power to retain moisture. It is also liable to expand or contract upon being subjected to variations of temperature.

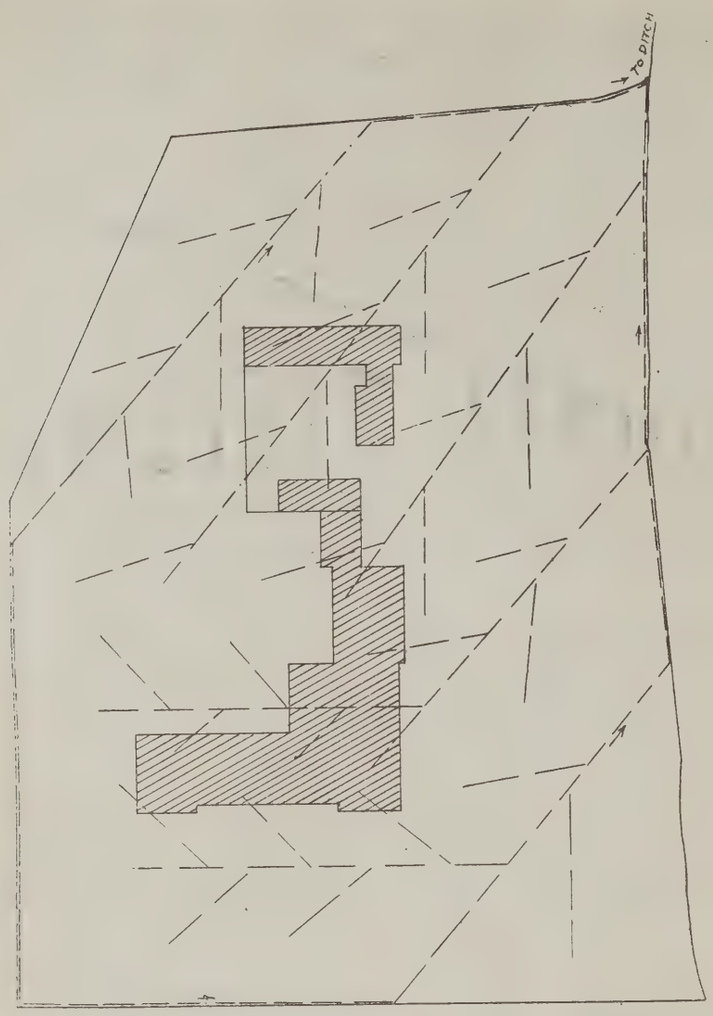

FIG 1

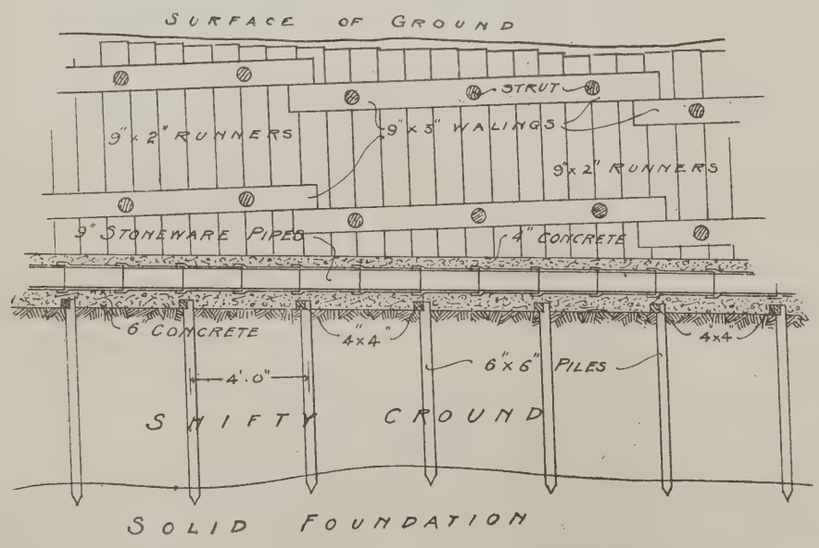

METHOD OF SUBSOIL DRAINAGE.

"Made ground," that is, ground which has been made up or formed by tipping loose soil, dry rubbish, and other refuse, etc., is, in nearly every case, dangerous for use as a building site on account of the quantity of organic matter it usually contains, which, in decomposing, gives rise to dangers likely to imperil the health of anyone living in houses upon it. It is also very unsatisfactory for building upon, as the foundations must be carried down until a hard and natural foundation is reached.

In certain cases, such as in low-lying districts, etc., there may be no alternative to a damp site, in which case it is very necessary to have the subsoil thoroughly drained before commencing to build.

The model by-laws state that "every person who shall erect a new building shall cause the subsoil of the site of such building to be effectually drained by means of suitable earthenware field pipes properly laid to a suitable outfall, whenever the dampness of the site renders such precaution necessary. He shall not lay any such pipes in such manner or position as to communicate directly with any sewer or cesspool, or with any drain constructed or adapted to be used for conveying sewage, but shall provide a suitable trap with a ventilating opening at a point in the line of the subsoil drain as near as may be practicable to such trap." In the case of a large site, this may be done in the following manner:—A narrow trench, three to five feet in depth, is cut around the site to intercept any water likely to flow from the adjoining land. Smaller trenches are then cut dividing the whole of the site into bays, each one running from the highest to the lowest part of the site. From these, again, diverge other trenches running in herring-bone fashion from the centre of each bay.

At the bottom of these trenches, which should be cut to a fall of not less than 1 in 60, is then laid a series of 2 or 3in. earthenware "agricultural" or "field pipes," each about 12 or 15 inches long. These pipes are generally laid "dry" with a butt joint, the space being left for

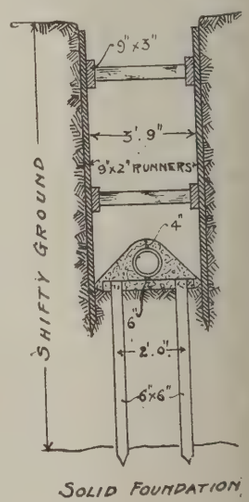

FIG. 2.

METHOD OF SUPPORTING DRAINS ON SHIFTY GROUND.

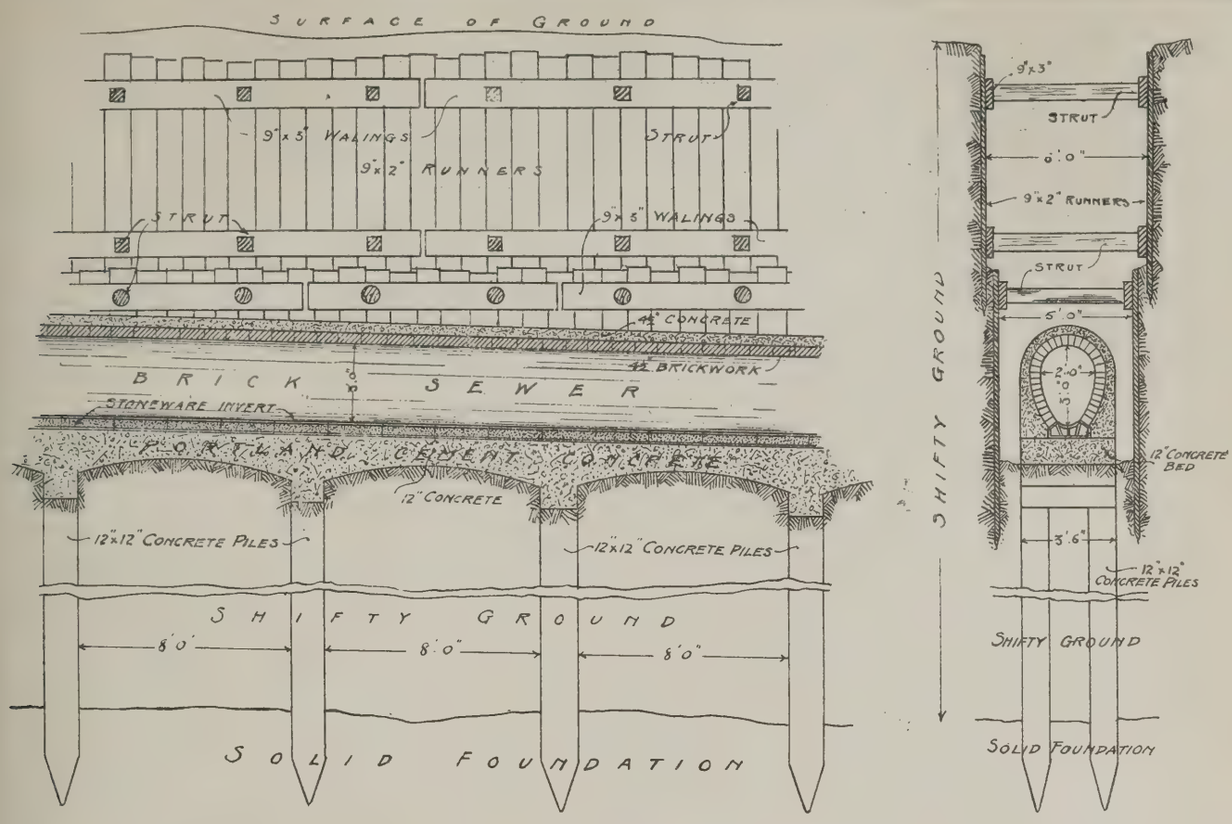

FIG. 3.

the water to find its way in. In place of the pipes, large stones are sometimes employed, spaces between them being formed to allow the water to flow through. Loose earth of a pebbly or gravelly nature is then lightly filled in above all trenches and rammed on the top only. The distance apart of the tributary trenches generally varies from about 10 to 20ft. in clay, and 25 to 40ft. in lighter soils.

The fall of all trenches or pipes naturally leads from the highest point of site to the main trench at the lowest point, which should discharge into a ditch, or sometimes a sewer, in which case it must be disconnected by means of a syphon trap and properly ventilated. That portion which is between the disconnecting trap and the sewer must be constructed with non-porous pipes and properly jointed, as required in the case of an ordinary drain. Fig. 1 shows an illustration of subsoil drainage.

It may sometimes be necessary to construct a drain or sewer in loose, shifty, or waterlogged soil, or in "made ground." This may be done by either of the following methods:—

First, by sinking a shaft (if in waterlogged soil) just clear of the line of drain and to a depth of a few feet below the drain level, so as to enable the ground water to be drawn off by pumping and thus facilitate the excavating of the trench. This must then be cut to the required width and depth of the drain, care being taken that the sides are thoroughly well timbered. Small piles are then driven on both sides of the trench, right down through the loose soil until the solid ground is reached. These piles are generally driven every 4ft. along the trench, being at every other joint of the stoneware pipes, though the distance will vary according to the nature of the ground. The tops of the piles are then sawn off at a level sufficient to give the required fall, and cross-pieces of timber are then fixed to the head of each pile on either side of the trench.

The ground should be solidly rammed to the level of the bottom of concrete bed, and the concrete bedded around and carried by the top cross-pieces of timber. The pipes are then laid in the ordinary way and the concrete flaunched up at the sides or completely covered around the pipes. Iron pipes, on account of their additional strength, may be used with advantage in such a case, as well as many of the patent composition jointed stoneware pipes now on the market. Fig. 2 illustrates such a method of construction.

Where the loose shifty soil extends to a considerable depth, or where there is any likelihood of the timber piles being attacked by insects or subjected to alternations of dryness and moisture, armoured concrete piles should be used in place of timber. These piles can be cast to almost any required length, and are capable of making a permanent and satisfactory job. Fig. 3 illustrates a method of carrying a brick sewer through very loose and shifty ground of considerable depth by the aid of concrete piles.

Another method is to construct solid concrete piers in place of the piles, but at a distance apart of about 9ft., being the length of an ordinary iron pipe. This distance, however, may vary according to the nature of the soil. The piers should be the full width of the trench and must be carried down to the solid foundation. The intermediate space between piers is spanned by a flat concrete arch—as in the previous case—which forms the bed upon which the pipes are carried. This is a more costly method, however.

Contractors' Notes.

Swansea Building Trade.

The Swansea plasterers have handed in their notices, as the Association desires to bring about an alteration of the working rules. The joiners of the town, numbering 300, have also given in their notices, asking for an advance of 1d. per hour. The matter is to come before the Master Builders' Association, and will probably be referred to the Conciliation Board.

The Plumbers and the "Hall-mark."

The plumbers in conference at Edinburgh on August 8th devoted considerable time to the question of compulsory registration. One of the speakers held that: "When they considered the amount of power the plumber had in his hands, and how much suffering he could cause by carelessness and dishonest work, if it was worth while that doctors should have a hall-mark of some kind before they were let loose on the community to cure disease, it was equally important for the health of the community that plumbers should be registered in some way before they were allowed to take part in sanitary work." The "Glasgow Herald," commenting upon this, says: "The National Registrationists must continue to educate the plumber until it is the aim of the least ambitious to take his D.P.H. In too many cases he considers that his professional status can be adequately maintained by smoking his pipe in the drawing-room until the boy has come back with the tools which the Worshipful Plumber is forbidden by professional etiquette to carry, and that the true and only necessary hall-mark for him is the horrid mess he leaves in the lobby." The plumber has long been a stock subject

for profane jesting, but he will be pained to find a staid Scottish newspaper indulging in such heartless levity.

Grimsby Building By-laws—Peculiar Procedure.

The Corporation of Grimsby has been having some trouble over breaches of its building by-laws, and recently proceeded against half-a-dozen offenders. Mr. H. G. Whyatt, the Borough Surveyor, who prosecuted, explained that for a long time the Corporation had allowed persons to commence the erection of buildings before the plans had actually been deposited, and when the plans were found to be in order nothing was said. Last winter, however, cases arose in which buildings were so commenced, and the plans when deposited were all right, yet the buildings when completed did not accord with the deposited plans, and were in violation of the by-laws. Some builders were let off by the Corporation, others were made to alter their buildings, while yet others were compelled to pull down. These cases caused a good deal of friction between the members of the Committeee, the Town Council, and the builders of the town, and eventually the Council gave a hard-and-fast ruling that in the future cases of the kind the town clerk should at once proceed against the offenders; hence the present cases. Three cases were dismissed on technical grounds, the evidence as to dates of the offences not coinciding with the dates given on the summonses. Three other defendants were each ordered to pay 7s. 6d. costs. The usual custom is for the building owner to give fourteen days' clear notice of intention to commence building after the deposit of the plans. The present procedure, which, it is presumed, the Council will now reform, seems to afford endless opportunities for trouble and expense both to the Corporation and to the builders.

Law Cases.

ARCHITECT'S FEES AND A "SPECULATIVE ARRANGEMENT." — In the Manchester County Court on August 10th, John Knight, architect and surveyor, claimed £38 as fees for work done and services rendered to Julius Frankenburg, who trades as the Hulme Bacon-smoking Company in Milton Street, Hulme.—Dr. Atkinson, who appeared for the plaintiff, explained that the defendant was the owner of nine houses in Yarburgh Street, Moss Side, and that in October last his solicitor called on the plaintiff, told him of a scheme to turn the houses into a residential club, and asked him if he would prepare the plans. After an interview with Mr. Frankenburg, plaintiff did this, and made an extra copy for the solicitor. Subsequently the solicitor mentioned that the idea was to form a company to carry out the scheme, and asked him if he would put some money into it. When he declined, he was told that it would not matter, but that as Mr. Frankenburg would be taking a large part of the purchase money in shares he wanted to get rid of some of them. Mr. Knight then said something to the effect that if the thing turned out a success he might take some of his remuneration in shares, but that he could not promise anything.—In confirming this statement, plaintiff, in his evidence, denied that he ever promised to take shares as payment, and he denied that it was at all usual for architects to make plans on the system of "no cure no pay." The defence raised was that the whole arrangement was speculative. The solicitor who made it with Mr. Knight, had, it was urged provided him with similar work in the past, the conditions being that pay would only be given in the event of the syndicate being formed and the scheme carried through.—Judge Parry said he agreed that there had been a considerable amount of speculation in the case, but he had come to the conclusion that Frankenburg gave the order for the work to be done, and that the plaintiff looked to him for payment. The defendant had not proved, however, that the plaintiff had entered into a purely speculative bargain. The work of surveying and the drawing of the plans had been carried out, and the defendant had actually used the plans in attempting to carry out his scheme. Undoubtedly they would be the basis of the syndicate's operations if the scheme were carried through. At the same time he thought it was well understood that Mr. Knight was not to get the whole of his fees in cash, but that he was to accept part in the form of shares. He would therefore award him £25, with costs on that amount.

FACULTY FOR A SIDE CHAPEL.—At a Consistory Court of London, held in St. Paul's Cathedral on August 12th, by Dr. Tristram, K.C., Chancellor of the Diocese, a petition was presented praying for a faculty authorizing the erection of a side-chapel with the holy table in the church of St. Thomas, Orchard Street, Portman Square. The Rev. A. G. Locke, the vicar, in moving for the faculty, stated that the population of the parish at the last census was 7,979, and there was accommodation in the church for 1,050. The side-chapel was needed for the greater spirituality of the daily services when there were but few persons present, as well as for economy in light and fuel and for lessening the strain on the voice of the officiating minister. It was proposed to fit up a portion of the north aisle immediately west of the organ as a side-chapel with a holy table, and to substitute chairs for six pews under the gallery. The proposal was placed before a meeting of the vestry on July 24th, and unanimously approved. It was also supported by the congregation as a whole.—Mr. W. H. Trollope, the people's churchwarden, gave evidence in support of the application.—The Chancellor decreed the faculty as prayed. He had seen the plans and approved them.

INTERNATIONAL CONGRESS ON ROADS.

An important international congress, convened by the French Government, will meet in Paris in October next to deal with a great variety of problems concerning the construction, maintenance and regulation of roads. It is evident that many of these questions have an intimate connection with the enormous extension of motoring in recent years, and their solution has become an urgent necessity. Among the points to be considered are the materials used in constructing roads, the means of counteracting wear and dust, watering, turnings and obstacles, the deterioration caused by new kinds of locomotion, and signals and sign posts indicating dangerous gradients, distances, altitudes, and the like. Not only the wear and tear caused by motors but the reciprocal action of different kinds of thoroughfares on tyres and cars generally will be discussed. The congress will be the first of the sort ever held, and it will no doubt throw much interesting light on the highway of the future. The Roads Improvement Association is taking a very active interest in this congress, and Lord Cadogan, the president of the Association, has addressed a circular letter to the road authorities of Great Britain asking them for statistics respecting attempts to deal with the dust problem, which information will be submitted to the Congress. The circular asks for a return of the length, area, and cost of the roads (*a*) laid with dustless road material; (*b*) treated with a surface coating of tar; and (*c*) treated with other palliatives. Information is also sought as to comparative cost, results, notes of efficiency, etc. The returns, when collated and summarized, should be of considerable value to road authorities. It is estimated that the cost of collecting and summarizing these reports will be about £150. Contributions towards this expense are gladly received by the Hon. Secretary of the Roads Improvement Association, 1, Albemarle Street, Piccadilly, London, W.

THE PORTLAND CEMENT TRADE.

Trade continues dull, and consumption is still low for the time of year. The falling-off is no doubt mainly due to the diminished demand for export, for the published figures relating to Portland cement exported from the United Kingdom for the six months to June 30th last, show a reduction, as compared with the corresponding period of 1907, of no less than 90,666 tons. Notwithstanding the stagnation in the home building trades, it is pretty generally admitted that the demand in the United Kingdom itself is very much as it was a year ago, so that the present unsatisfactory position of the trade may be regarded as almost wholly due to the slackness in the over-seas markets. Whatever the cause, there is no doubt that the present low level of prices is causing grave anxiety to many manufacturers who are still suffering from dear fuel, and to an extent which means that present prices show little or no profit on their sales. Fortunately there is more activity in the larger constructional work throughout the country, and many important projects, we are informed, are about to be put in hand, owing, perhaps, to some extent, to the more favourable monetary conditions, which now permit the raising of loans on moderate terms. There is no doubt that cheap money is the one factor in the situation which the cement maker is relying upon at the moment for an improvement in his trade. A reduction in the cost of manufacture consequent upon cheaper fuel in the late autumn will result in some improvement in the position, and if by that time there is, as is expected, a substantial increase in the number of large constructional works put in hand, we shall certainly see a hardening of prices, and possibly a substantial advance. As evidence of the fact that present prices are absolutely unremunerative, it is mentioned that a number of works in practically all the cement-making districts have been closed, while others are on substantially reduced make; but notwithstanding this fact, it may be doubted whether stocks at works show in the aggregate any increase over the figures of a year ago.

Current Market Rates of Materials in the Various Trades.

The quotations given in this list apply only to larger quantities purchased in London (the minimum quantity for which these prices are applicable being given where practicable). Retail purchasers must expect to pay a reasonable advance on wholesale rates, as well as carriage. The trade discounts for each item have not been considered, as these would be affected by the quantity of the goods purchased. The endeavour is made to give fair average prices, which would in many cases be affected by the quality of the materials required.

BRICKLAYER.

The current rates for stocks, Flettons, and other common building bricks, and for local facings are not given, as local considerations obviously affect their prices, and readers who may make use of the information given in these columns can readily obtain quotations for themselves.

NEW BUILDINGS.

The Royal Princess's Theatre, Glasgow, has been remodelled at a cost of more than £2,000.

A cheap church that has just been completed is that of St. Paul, Stuart Street, Bradford, the cost per sitting being rather less than £8. The church seats 542 persons, and has cost only £4,000. Mr. E. Lingan Barker, of Manchester, is the architect.

A town hall and municipal offices for Girvan are to be erected at the expense of Mr. John McMaster, of Canterbury, who stipulates that the old town steeple shall be embodied in the design, and that the cost of the work is not to exceed £7,500.

New Council schools at Thornaby which have been built at a cost of £10,0 and are to be opened on August 24 will accommodate 800 children, and the is provision for further extensio Messrs. Clark and Moscrop, of Darlin ton, are the architects, and Messrs. Dickenson and Son, of Middlesbrou the contractors.

Obituary.

MR. DUNCAN MACKELLAR, R.S.W., Glasgow, who died last Thursday mo ing, at the residence of his brother, Lochgoilhead, was a native of Inverar where he was born about 60 years a He was, throughout most of his life, as ciated with Glasgow. As a student London, he spent much time in So Kensington Museum, making sketches old furniture and other articles, wh he afterwards found useful for the c tume subjects for which he had a spec liking; after leaving London he visit many well-known historical houses, su as Haddon Hall and Hardwicke Hall, Derbyshire, and old Moreton Hall, Cheshire, where he gathered material future pictures. One of his latest p tures, "The Minuet," and one of the b examples of his work, hung at this yea exhibition of the Royal Glasgow Ins tute of the Fine Arts, was purchased the corporation, and is now in the g leries at Kelvin Grove.

"Specification" provides all the information that professional men require when preparing drawings, writing specifications, or compiling bills of quantities, saving the time usually spent in consulting a large number of books. Each section is compiled by a specialist in the particular branch of which they treat, and is arranged under the usual trade headings of a complete specification, thereby greatly enhancing its value.

ARCHITECTURE... and JOURNALISM.

This is the title of a Booklet, beautifully printed and illustrated, giving an interesting account of the publications issued by this Company.

This booklet contains a suggestion, and sets out an arrangement showing how Architects and others can utilize any particular points of interest that they come across in their practice, and thus not only add to their own incomes, but add to the value and practical interest of our papers.

TECHNICAL JOURNALS, Ltd.
Caxton House,
Westminster, S.W.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

EAST HAM.—Erection of workshops, etc., in accordance with drawings, specifications, conditions, and bills of quantities (which may be obtained on application to Adam Horsburgh Campbell, M.Inst.C.E., Town Hall, East Ham, E.), for the Higher Education Committee. For a copy of the bills of quantities tenderers are required to deposit with S. A. Batchelor, secretary, the sum of £5, which will be returned upon the receipt of a bona fide tender. Tenders to be enclosed in a sealed envelope, addressed "To the Chairman, Technical College, East Ham, E.," and endorsed "Technical College Extension," not later than 10 o'clock a.m. August 31. The firm whose tender is accepted will be required to enter into a contract, with approved security, for the due and faithful performance thereof. Fair wages clause.

August 31. USWORTH.—1. Erection of 50 workmen's dwellings. 2. Roadmaking and surface drainage in connection therewith at Usworth, in the rural district of Chester-le-Street, for the County Council of Durham. Plans, specifications, and general conditions of contract can be seen and bills of quantities obtained at the office of Brown and Spain, architects, 51, Fawcett Street, Sunderland. Sealed tenders, endorsed "Usworth Housing," to be delivered to Robt. A. Wheatley, deputy-clerk to the County Council, Shire Hall, Durham, not later than August 31.

August 31. COVENTRY.—Construction of a canal quay wall about 660 ft. long, for the Gas Committee of the Corporation. Form of tender, specification, bill of quantities, and general conditions may be obtained, and drawing may be seen, on application to Fletcher W. Stevenson, engineer and general manager, Gas Works, Coventry, and on payment of one guinea, which will be returned on receipt of bona fide tender. Sealed tenders, addressed to the chairman of the gas committee, gas works, Coventry, must be delivered by first post August 31, endorsed "Tender for Canal Quay Wall."

September 1. CRADLEY HEATH.—Erection of library in front of Cornegreaves Old School, Spinner's End, Cradley Heath, for the Rowley Regis U.D.C. Plans, specification, and conditions, prepared by Wills and Anderson, the council's architects for this purpose, may be seen at the council's offices, Old Hill, on and from August 20 between the hours of 10 a.m. and 4 p.m. (Saturdays, from 10 a.m. to 1 p.m.) Quantities may be obtained at the same place on payment of £1, which will be returned if a bona fide tender is sent in. Tenders, duly endorsed, must reach Daniel Wright, clerk, Council Offices, Old Hill, Staffordshire, not later than noon on September 1.

September 2. POPLAR.—Erection of verandah at children's block of Poplar workhouse. Persons desirous of tendering should communicate with J. H. Lough, 45, Upper North Street, Poplar, E., by August 10. Tenders to be submitted not later than September 2.

September 2. GAINSBOROUGH.—Erection of the buildings in connection with proposed refuse destructor, for the U.D.C. Drawings may be seen, and specification, form of tender and bill of quantities obtained from Sam W. Parker, engineer and surveyor, Council Offices, Gainsborough, upon payment of £2 2s., which will be returned to the contractors on receipt of a bona fide tender, provided the same is not withdrawn. Tenders, enclosed in an official sealed envelope, endorsed "Refuse Destructor Buildings," must

be delivered to Decimus M. Robbs, clerk to the council, not later than September 2.

September 5. LEICESTER.—Erection of a superintendent's house in connection with the Beaumont Leys Farm Bacterial Works, for the Corporation of Leicester. Particulars may be obtained at the borough engineer's office, on payment to the Borough Treasurer of £2, which will be returned on receipt of a bona-fide tender. Sealed tenders, on the forms supplied, addressed to "The Chairman of the Sewage Works and Farms Committee, Town Hall, Leicester," are to be delivered not later than 9 a.m., on September 5, endorsed "Tender for Superintendent's House."

September 5. KIRKBURTON, near Huddersfield.—(1) Erection of six cottages; (2) sett paving road to boiler house; (3) extension to stables, for the West Riding County Council. Plans may be seen and bills of quantities obtained on application to the country architect. A deposit of £1 is required, which will be returned on receipt of a bona-fide tender. Cheques, etc., must be made payable to the West Riding Treasurer and sent to him direct at the county hall, Wakefield. Sealed tenders, properly endorsed, to be forwarded to J. Vickers-Edwards, county architect, County Hall, Wakefield, not later than 10.30 on September 5.

September 5. LEICESTER.—Erection of superintendent's house at the sewage disposal works, for the corporation. Tenders to be submitted to the chairman of the sewage works and farms committee not later than September 5.

September 8. HAWARDEN.—Erection or a new Council school to accommodate 500 scholars, at Shotton, for the Education Committee. Plans and specifications can be seen at the office of the county surveyor, County Buildings, Mold, from whom copies of the bill of quantities can be obtained on payment of a sum of two guineas, which sum will be returned on receipt of a bona fide tender. Tenders, on forms which will be supplied, to be delivered in sealed endorsed envelope, at the address printed thereon, not later than noon on September 8.

September 8. SPAXTON.—Structural reparation to the exterior of the fabric of the church of St. Margaret, for the Reparation Committee. Specifications and condition of contract may be inspected at the offices of the architects, Cottam and Samson, 43, High Street, Bridgwater, and 1, Hammet Street, Taunton, who will supply forms of tender; or at the church, where also the stone that will be used for the work may be seen between the hours of 10 a.m. and 5 p.m. Sealed tenders, endorsed "Tender for Works of Preparation, Spaxton Church," to be delivered at the offices of the architects, or at the address of the chairman of the committee, Spaxton Rectory, Bridgwater, not later than 5 p.m. on September 8.

September 9. LONDON, W.—Erection of a block of shops and showrooms at 143-9, Great Portland Street, London, W. Drawings, specification, and conditions of contract may be inspected at the offices of the architects, John W. Simpson and Maxwell Ayrton, 3, Verulam Buildings, Gray's Inn, W.C., from August 24 to Sept. 8, between 10 and 4. Bills of quantities and forms of tender may be obtained at the same address on payment of three guineas. The sums so paid will be returned to those persons who send in tenders on the forms provided in conformity with the conditions. Tenders must be delivered before noon on Sept. 9, addressed to the Owner, Great Portland Street site, care of Messrs. Jubber and Co., 61, Great Portland Street, W., and endorsed "Tender for Shops and Showrooms."

September 9. LETCHWORTH GARDEN CITY.—Erection and completion of a new County Council school at Letchworth Garden City, for the Education Committee of the County Council. Persons desiring to tender for the work may see the drawings, specification, agreement, etc., at the county surveyor's office, Hatfield, between the hours of 10 a.m. and 4 p.m., except on Saturday, when they may be seen from 10 a.m. till 12 noon. A copy of the schedule of works (quantities) and a form of tender can be obtained at the county surveyor's office, on or after the above-mentioned date, upon payment of two guineas, which sum will be returned to the tenderer upon receipt of a bona fide tender and the documents which have been supplied to him. Sealed tenders, endorsed "Tender for New School, Letchworth," must be delivered to Urban A. Smith, county surveyor, County Surveyor's Office, Hatfield, not later than 5 p.m. on September 9. Such security for the due execution of the works as the council may require must be given by the contractor.

September 12. KILLALOE (Co. Clare).—Erection and completion of a new chapel at Garraunboy, Killaloe, Co. Clare, for the Very Rev. Canon D. Flannery, P.P., and committee. Drawings and specification may be seen at the parish priest's house, Killaloe, or at the office of the architects. Bills of quantities for the use of builders tendering can be had at the office of O'Malley and O'Rourke, architects, 10, Glentworth Street, Limerick, or with the parish priest. Sealed tenders, endorsed "New Chapel, Garraunboy," accompanied by bills of quantities, must be delivered to the parish priest on or before September 12. Two solvent sureties required for the due performance of the contract.

September 14. FARNBOROUGH.—Erection of a children's home at the workhouse, Farnborough, Kent, for the Guardians of the Bromley Union. Plans and specification may be seen after the 25th inst., at the office of the architect, John Ladds, 93, Pemberton Road, Harringay, N., between the hours of 10 a.m. and 4 p.m. (Sundays excepted). Builders desirous of tendering must apply by letter to the architect on or before August 25 for copies of the quantities, enclosing a £5 Bank of England note, which will be returned to those builders sending in a bona fide tender upon their returning the receipt given within three months from the date thereof. Tenders, endorsed "Children's Home," must be delivered to Edward Haslehurst, clerk to the Guardians, Union Offices, Park House, Beckenham Lane, Bromley, Kent, not later than 5 p.m. on September 14. No order will be given for commencement of the work until the Local Government Board have sanctioned the necessary loan in connection therewith. The person whose tender may be accepted must be prepared to enter into a contract and a bond, with sufficient surety, for the fulfilment thereof.

October 7. INVERNESS.—Construction of a boat shelter at the Harbour of Inverness, the total cost of the scheme not to exceed £10,000, for the Harbour Trustees. Plans should be lodged with Kenneth Macdonald, clerk to the Harbour Trustees, Town House, Inverness, on or before October 7.

No date. BIRSTALL.—Erection of 16 cottages on a site adjoining Leylands Road, Birstall, for the Committee of the Birstall Industrial Co-operative Society. Tenders in separate trades required. Bills of quantities have been prepared, and may be obtained on payment of a deposit of one guinea on application to the architect, R. Worcester, Co-operative Wholesale Society, Ltd., 1, Balloon Street, Manchester. The deposit will be returned on receipt of a bona fide tender.

No date. BACUP.—Erection of Northern Council school, Bacup. Persons desirous of tendering are requested to forward at once a list of the branches for which they desire to compete, to the architects, S. Butterworth and Duncan, F.R.I.B.A., Rochdale.

No date. BELFAST.—Erecting and completing a pair of semi-detached villas on Ravenhill Road, Belfast, for W. E. Bourke, Esq., Rosemary Street, Belfast. Plans and specification can be obtained upon application to Frank J. M'Cann, C.E., architect, 102, Donegall Street, Belfast.

No date. COWDENBEATH. — Erection of a house at North Road, Cowdenbeath. For plans and specifications apply Brown, Annbank, Morayfield, Cowdenbeath.

No date. RESOLVEN.—Erection of two houses at Glyn Neath Road, Resolven, for Lewis Lewis, Brondeg House, Resolven. Plans and specification may be had on application to the abovenamed.

No date. BELFAST.—Roof 240 by 50 ft., for Belfast. All particulars with W. P. Butterfield, Galvanising Works, Shipley.

No date. FLEETWOOD.—Erection of new wards, etc., at the Fleetwood Cottage Hospital. Plans, specifications, and bills of quantities may be inspected until August 19 at the office of the architect, Bertram Drummond, A.R.I.B.A., 54, Alfred Terrace, Fleetwood. After inspection copies of the bills of quantities and specifications (the latter to be returned with tender) can be obtained from the architect on payment of the sum of one guinea, which will be returned upon receipt of a bona fide tender.

ENGINEERING.

August 24. RUISLIP-NORTHWOOD.—Supply and fixing of the following machinery (inter alia), viz.:—Two 10-10½ b.h.p. oil engines, two 6-6½ b.h.p. oil-engines, together with shafting, four centrifugal pumps, suctions, valves, spares, etc., for the Urban District Council. Further particulars and form of tender may be obtained from H. Howard Humphreys, M.Inst.M.E., 28, Victoria Street, Westminster, S.W., between the hours of 10 a.m. in the forenoon and 4 in the afternoon. A deposit of £2 2s. will be required, which will be returned on receipt of a bona fide tender. Sealed tenders, endorsed "Pumping Machinery," must reach Edmund R. Abbott, clerk to the Council, Council Offices, Northwood, R.S.O., Middlesex, not later than 4 p.m. on August 24.

August 24. RUISLIP-NORTHWOOD. — Supply and fixing the following plant at the sewage disposal works, near Ruislip Common, Middlesex, for the Urban District Council: Three 90 ft. diameter revolving sewage distributors. Further particulars and form of tender may be obtained from H. Howard Humphreys, M.Inst.M.E., of 28, Victoria Street, Westminster, S.W., between the hours of 10 o'clock in the forenoon and 4 o'clock in the afternoon. A deposit of £2 2s. will be required, which will be returned on receipt of a bona fide tender. Sealed tenders, endorsed "Sewage Distributors," must reach Edmund R. Abbott, clerk to the Council, Council Offices, Northwood, R.S.O., Middlesex, not later than 4 p.m. on August 24.

August 25. NUNEATON.—Construction of a waterworks filter-bed in Hennebique's ferro-concrete construction, for the Corporation. Plans and specification may be seen, and form of tender obtained, on application to the water engineer. Tenders, endorsed "Tender for Filter-Bed," must be delivered to F. C. Cook, water engineer, Municipal Offices, Nuneaton, not later than noon on August 25.

August 26. SUTTON-IN-ASHFIELD.—Supplying and fixing one set of "new treble barrel pumps" with a "coal-gas engine" to work the same, complete, for the Water Committee of the U.D.C. Engine and pumps must be guaranteed to deliver 12,000 gallons per hour, at the rate of 14 pump strokes per minute each barrel into reservoir, which is 150 ft. above the level of the pumps, through 3,333 yds. of 6 in. mains. Pumps will stand on the floor level, with 6 ft. of suction to work from tank below and fed with a ball valve. Sealed tenders, endorsed "Pumps," with plans, specifications, and full particulars, to reach T. Robinson, Waterworks Offices, Sutton-in-Ashfield, not later than August 26.

August 26. BURNLEY.—Supply and erection of steel roof for new retort house at the gasworks of the Corporation. Specification and forms of tender may be obtained on application to the engineer, J. P. Leather, Gas Works, Burnley. Drawings may be inspected at the gasworks, or if desired photo copies will be sent to intending contractors on receipt of 10s. Tenders, endorsed "Steel Roof," must be sent in not later than August 26, addressed to the Chairman of the Gas Committee, Town Clerk's Office, Town Hall, Burnley.

August 28. DONCASTER.—Construction of the Marsh Gate Bridge and approaches over the Great Northern Railway at Doncaster, for the town council. Contract drawings and specification may be seen, and copies of these and of the quantities, for which a charge of three guineas will be made, which will not be returned, may be obtained at the office of the engineers, Parry and Bidder, 13, Victoria Street, Westminster. Tenders must be sent in to R. A. H. Tovey, town clerk, Doncaster, not later than 2 o'clock, on August 26, endorsed "Tender for Bridge." Only tenders from contractors experienced in railway work will be considered

September 4. DONERAILE, Co. Cork.—Construction of waterworks, for proposed sanatorium at Streamhill, Doneraile, Co. Cork, in accordance with plans and specification prepared by Richard Evans, C.E., 53, South Mall, Cork, for the Joint Hospital Board. Plans and specification may be inspected at the engineer's office, between the hours of 10 and 5 o'clock. Quantities will be supplied on payment of a guinea, which will be returned on receipt of a bona fide tender. Each contractor shall lodge with his tender a sum of £10, or a cheque for that amount, duly certified, and, in separate cover, a detailed estimate. In case of a tender being accepted, the sum lodged shall be returned upon the contractor and his sureties signing his contract and bond within fourteen days of acceptance, or in default such sum shall be forfeited. In case of non-acceptance of tenders, the sums lodged shall be returned. The contractor whose tender may be accepted shall sign a bond in which he shall be joined by two sureties or a guarantee society approved of by the board, and shall pay the cost of such bond. Tenders, endorsed "Tenders for Waterworks," must reach E. J. Murphy, secretary, County of Cork Joint Hospital Board, Courthouse, Cork, on or before noon, September 4.

September 15. LEITH.—Execution of the undermentioned works by a utilisation of the material of the existing unfinished iron bridge over the Caledonian Railway Company's line at Victoria Park, for the Corporation of Leith. (1) Construction of a footbridge on the site of the bridge referred to. (2) Widening of Junction Bridge. All conform to relative plans and specifications to be seen at the surveyor's office. Offers, sealed and marked "Bridge," to be lodged with J. R. Findlay, burgh surveyor, Burgh Surveyor's office, 35, Charlotte Street, Leith, on or before September 15.

IRON AND STEEL.

August 26. CHORLTON-CUM-HARDY.—Supplying and fixing wrought iron railings, gates, and guards to staircases and staircase windows at the Oswald Road Municipal school, Chorlton-cum-Hardy, for the Manchester Education Committee. Drawings and specification may be obtained at the education offices, Deansgate, Manchester, on a deposit of £1 1s., which will be returned on receipt of a bona-fide tender. Tenders in the envelope provided must be delivered not later than August 26. Cheques to be made payable to the accountant education offices, Deansgate, Manchester.

PAINTING AND PLUMBING

August 22. BICESTER.—Painting the inside and outside of steel tanks at the Water Tower, and lime-washing and cement washing of the interior of tanks, etc., for the Urban District Council. Specifications and conditions of contract, with forms of tender, may be obtained from R. Parker, surveyor to the council. Tenders, on the prescribed forms, endorsed "Waterworks," must be delivered

to Edward Foster Tanner, clerk to the Council, Bicester, Oxon., on or before noon, August 22.

Plans and specifications may be seen and quantities obtained at the office of N. P. Pattinson, borough engineer, town hall, Gateshead. Tenders are to be sent in sealed and endorsed "Tenders for Street Paving," before 2 p.m. on August 25.

August 31. COVENTRY.—Paving 7,500 sq. yds. with 4 in. granite cubes and other work in connection therewith, for the Gas Committee of the Corporation. Forms of tender, specification, bill of quantities, and general conditions may be obtained, and drawing may be seen, on application to Fletcher W. Stevenson, engineer and general manager, Gas Works, Coventry, and on payment of one guinea, which will be returned on receipt of bona fide tender. Sealed tenders, addressed to the chairman of the gas committee, Gas Works, Coventry, must be delivered by first post August 31, endorsed "Tender for Paving."

August 31. ST. ALBANS. Supply of broken granite (about 1,000 tons) to be delivered at St. Alban's Station in full truck loads during the ensuing 12 months in such quantities as shall from time to time be ordered by the city surveyor, for the Corporation. Forms of tender can be obtained of the city surveyor, Victoria Street, St. Albans. Tenders (accompanied by samples) to be sent to A. H. Debenham, town clerk, St. Albans, by August 31.

September 1. STROOD (Rochester).—Making, paving, and channelling Bingham Road, Lindsbury, situated partly in the city and partly in the rural district of Strood. Plans and specifications can be seen, and forms of tender obtained, as to that portion within the city at the city surveyor's office, Guildhall, Rochester, during office hours, and to that portion in the rural district of Strood at the office of the district surveyor, L. Randerson, Blendon Villa, Meopham, near Gravesend, between the hours of 9 a.m. and 1 p.m. daily. Sparate tenders, addressed as to the portion within the city to the town clerk, Rochester, **and to that portion** within the rural district of Strood to the clerk at the Rural District Council's offices, 13a, Gun Lane, Strood, Rochester, must be sent in by September 1.

September 1. LEATHERHEAD.—Construction of Belmont Road, for the Urban District Council. 1. Making-up. 2. Construction of storm-water drain. Plans may be seen and specification, schedule of prices, and forms of tender obtained at the office of J. E. Smales, surveyor, Council Offices, Leatherhead, upon payment of a deposit of one guinea, which will be returned on receipt of a bona fide tender. Sealed tenders, endorsed "Private Street Works," must be delivered, addressed to the clerk, Council Offices, not later than 5 p.m. on September 1.

September 2.. LITTLEHAMPTON. — Supply and delivery free, as directed either at council's depots or at roadsides in Littlehampton district, of 500 cubic yards of clean, hand-picked land flints, broken to pass through a 2 in. ring, and equal to sample, which can be seen, for the Urban District Council. The whole to be delivered by the end of November. Forms of tender can be obtained of the council's surveyor, H. Howard, F.S.I., town offices, Littlehampton. Tenders, under cover and marked "Flints," to be forwarded to the chairman of the council, Town Offices, Littlehampton, not later than September 2.

September 5. SEAFORD.—Supply of 550 tons of 1½-in. granite chippings and 170 tons of cracked flints, delivered at Seaford Station, about the end of October, for the Urban District Council. Forms of tender can be obtained from the surveyor. Sealed tenders, endorsed "Road Material," to be sent to W. H. Pawson, clerk, Council Offices, Seaford, Sussex, on or before September 5.

September 14. STREATHAM.—Making up and paving the following new streets, viz.:—(a) Thrale Road, Streatham. (b) Part of Crowborough Road, Streatham, between Chillerton Road, and Ramsdale Road. (c) Part of Ramsdale Road, Streatham, between Rectory Lane and Crowborough Road, for the Council of the Metropolitan borough of Wandsworth. Specifications and drawings may be seen, and forms of tender obtained at the borough engineer and surveyor's office, New Streets Department, 53, East Hill, Wandsworth, between 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in separately sealed envelopes, and endorsed "Tender for Paving —— Road," must be delivered to Henry George Hills, Town Clerk, Council House, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose not later than 4 p.m. on September 14. If required, the contractor must provide two sureties for the due execution of the contract. Fair wages clause.

No date. CRICCIETH.—Construction of new roads and sewers of about 900 ft. in length on an estate at Criccieth. Full particulars may be obtained from G. Bovill, Esq., Estates Office, Rhydycreua, Bettws-y-Coed, North Wales.

FALMER AND OVINGDEAN.—Renovation of a portion of a road (known as "Warren Farm Road") in the parishes of Falmer and Ovingdean in the county of Sussex, for the Guardians of Brighton Parish. Specification, conditions of contract, form of tender, together with all information, may be obtained on application to George Burstow and Sons, surveyors, 16, Gloucester Place, Brighton. Sealed tenders, endorsed "Tender for Warren Farm Road," are to be addressed and delivered to B. Burfield, clerk to the Guardians, Parochial Offices, Prince's Street, Brighton, on or before 10 a.m. on August 25.

SANITARY.

August 21. HEATH TOWN.—Laying about 200 yards of 9 in. sewer and the construction of manholes, etc., in Cannock Road, for the Urban District Council. Drawings may be seen, and copies of the specification and quantities obtained at the office of the engineers, Berrington, Son, and Watney, Bank Buildings, Wolverhampton, on payment of one guinea, which will be returned upon the receipt of a bona fide tender. Sealed tenders, endorsed "Tender for Sewerage," must be delivered before noon on August 21, to J. W. E. Kirk, solicitor, clerk to the Council, Lichfield Street, Wolverhampton.

August 21. SKIPTON.—Construction of about 3,900 lineal yds. of 12 in., 9 in., 8 in., and 6 in. earthenware pipe sewers, with manholes, etc., also sewage tanks, continuous filters, pumping station, cast-iron rising main, and other works, for the Rural District Council. Drawings and specification may be seen, and form of tender with quantities obtained, at the offices of the engineer, H. A. Johnson, M.Inst.C.E., 15, The Exchange, Bradford; also at the offices of the council's surveyor, A. Rodwell, Gargrave Road, Skipton, on payment of a deposit of two guineas, which will only be returned on a bona fide tender being sent in in accordance with the specification. Sealed tenders to be sent to M. R. Knowles, clerk to the Council, Skipton, on or before August 21.

August 24. HALIFAX.—Construction of about 1,400 yds. of 15 in. and 12 in. diameter earthenware pipe sewers in Moor End Road, Mount Tabor Road, and Heath Hill Road, for the Corporation. Plans and specifications may be seen, and forms of tender obtained on application to James Lord, M.I.C.E., borough engineer, Town Hall, Halifax, upon payment of the sum of £1, which will be returned on receipt of a bona fide tender. Tenders, endorsed "Mount Tabor Sewers," must be sent to Keighley Walton, town clerk, on or before August 24. Fair wages clause.

August 24. TRING. — Execution of all work involved by the connection of house drains to the new system of sewerage in the town of Tring, on the basis of a schedule of prices, for the U.D.C. Specifications and schedules may be obtained at the offices of the engineers, Willcox and Raikes, of 63, Temple Row, Birmingham, on payment of a deposit of two guineas, which will be refunded on receipt of a bona fide tender and the return of all documents Sealed tenders, with schedule of prices filled in, in detail, on the form supplied, and endorsed "Tring, House Connections," must be delivered to A. W. Vaisey, clerk to the Urban District Council, Tring, Herts., not later than noon on August 24.

August 27. SURBITON.—Construction of main drainage, for the Urban District Council (subject to the sanction of the L.G.B.). The drawings, specification, bills of quantities and forms of tender may be inspected at the offices of the engineer, C. Nicholson Lailey, M.I.C.E., 53, Victoria Street, Westminster, between 10 a.m. and 5 p.m. (Saturdays excepted), until August 25. Tenders, sealed and endorsed "Surbiton Main Drainage," are to be addressed to F. J. Bell, deputy clerk, Surbiton Urban District Council Offices, Ewell Road, Surbiton, and delivered there before 6 p.m.

MISCELLANEOUS.

August 31. SHEFFIELD.—Foundations for new boiler, ashes and dust chambers, pipe trenches, retaining walls, etc., for the Electric Light Committee. Plans, specification, bill of quantities, form of tender, and general conditions of contract may be obtained from the engineer on making a deposit of one guinea for each set, which will be returned on receipt of a bona fide tender. Any person or firm sending in a tender will be required to add a schedule to such tender, stating the names of the various classes of labour which he or they intends or intend to employ, together with the places where such labour will be employed. Tenders, sealed and endorsed "Contract No. 54," to be delivered to S. E. Fedden, general manager and engineer, Corporation Electric Supply Department, Commercial Street, Sheffield, not later than 10 o'clock a.m. on August 31. Acceptance will be subject to the sanction of the Local Government Board for borrowing the necessary capital for the performance of the work. Fair wages clause.

September 1. LEATHERHEAD.—Supplying the undermentioned materials and labour for the year ending 30th September, 1909, for the Urban District Council:—Flints, team labour, provender, stoneware pipes, cement, disinfectants, ironmongery, smith's work, granite (Guernsey and Quenast), oil, steam rolling and scarifying, artificial paving. Tenders to be submitted, under cover, addressed to the clerk, Urban District Council, Council Offices, Leatherhead, on or before 5 p.m., September 1, endorsed "Tender for ——."

September 8. LONDON.—(a) Supply and delivery of 200,000 stoneware cable-ducts; (b) Laying of stoneware cable-ducts; (c) supply, delivery and erection of high and low tension switchgear; (d) supply, delivery and erection of six 500 kw., and one 150 kw. motor generators; (e) supply, delivery and erection at the Camden Town sub-station of one overhead travelling hand crane; (f) supply and delivery of low tension cables, cable boxes, etc., required for the wiring and fitting for electric lighting and power purposes of the electricity generating-station at East Greenwich and the central car repair depot, Woolwich Road, S.E.; and (g) wiring and fiting for electric lighting of the central car repair depot, Woolwich Road, S.E., for the L.C.C. Specifications, bills of quantities, forms of tender, etc., may be obtained from the clerk of the Council, at the County Hall, Spring Gardens, S.W., upon payment of the sum of £2 for each separate specification, etc. This amount will be returned to the tenderer, provided he shall have sent in a bona fide tender and not have withdrawn the same. Full particulars of the work may be obtained on application at the County Hall. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Ducts," "Tender for Laying Stoneware Ducts," "Tender for Switchgear," "Tender for Motor Generators," "Tender for Crane," "Tender for Wiring Material" or "Tender for Wiring Car Repair Depot," as the case may be. No tender will be received after 11 a.m. on September 8. Fair wages clause.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 10 o'clock on Tuesday morning.

A competent architectural assistant (24) desires appointment, permanent or temporary; good designer, accurate draughtsman; constructional details, specifications, quantities, moderate salary.—Box 4484, BUILDERS' JOURNAL Office.

AN Architect renders professional assistance, on Competition or contract drawings for any class of buildings; quantities accurately taken off; moderate terms.—C., 50, Elm Park Road, Finchley, London. 4437

ARCHITECTS' Assistant (20), 4½ years' thorough general experience, good draughtsman and colourist, details, perspectives, specifications, and quantities; first class references and testimonials; salary about 20s.—W. H., care of Hipwell, Surveyor, Chatteris, Cambs. 4456

ARCHITECT'S and Surveyor's Assistant (24), 8 years' experience, working and detail drawings, levelling, and surveying, special experience in engineering portion of public baths, etc.—C. O., 18, Kempston Road, Bedford 4425

ARCHITECT'S Assistant desires engagement; 6 years' general experience. — Sedgwick, Belvedere Road, Sunderland. 4367

ARCHITECT'S Junr., 5 years' London experience, neat draughtsman; good colourist, details.—Box 4480, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's Assistant (24); 9 years' London exp.; working drawings, specifications, superintendence, quantities and land surveying; prizeman, architectural drawing, and quantities; medallist building construction; excellent testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4408

ARCHITECT'S Assistant requires situation immediately; 7 years' varied experience; capable draughtsman, tracer, colourist, perspectives, details, specifications; assist quantities, supervision. Take charge; good education; 25th year; 35s. weekly.—Box 4481 BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (22), good varied experience; excellent testimonials; working drawings, details, measuring, supervising, etc.; holder of numerous certificates; moderate salary.—Box No. 4433, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (27), first-class artistic draughtsman, travelling studentship winner, 11 years' experience; perspectives, quantities, etc.; moderate salary.—Scott, 28, Cromwell Terrace, Halifax. 450c

ASSISTANT A.R.I.B.A. (29), thirteen years' London Provincial experience; testimonials, references, working drawings, details, specifications, supervision perspectives, office work; well up in management; salary 2 guineas.—Apply A., 31, Cotswold Road, Westcliff-on-Sea, Essex. 4512

ARCHITECT'S Junior Assistant, good draughtsman, 6½ years experience, working drawings, details, perspectives, surveying, specifications; assist quantities; mod. sal. for experience in good office.—"H.," 53, Hartwood Road, Southport. 4489

ARCHITECT'S Junior Assistant; disengaged; (21); 4½ years' experience; neat draughtsman and colourist; details; specifications; surveying; assist with quantities.—Box No. 4474, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (24), desires engagement; over seven years' varied experience; neat and expeditious draughtsman; honours construction and architecture certificates; excellent references; moderate salary.—W. E. K., 34, Wingate Road, Hammersmith. 4417

ARCHITECT'S and surveyor's assistant; seven years' country experience, working drawings, details, specification, surveying, levelling, school work a speciality; entire charge of contracts, 32s.; month's free services.—Box 4408, BUILDERS' JOURNAL Office.

ARCHITECT-SURVEYOR'S assistant requires situation at once. Three building construction certificates, and Prelim. R.I.B.A.; articled to A.M.I.C.E. and M.S.A.; good all-round experience. Age 24.—Box 4492, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (33), disengaged; 14 years' experience in good offices; first-class testimonials, and references; can take charge; specimens sent; salary £2. — Box 4491, BUILDERS' JOURNAL Office.

ARCHITECT'S Junior Assistant desires engagement (21); 4½ years' experience; neat draughtsman; assist with quantities; good references.—knowledge of gas-engine; good refs.—T. S., 4, York Terrace, King's Road, Herne Bay. 4450

ARCHITECT and surveyor's assistant (24); eight years' experience; working drawings, details, design, surveying, specifications, quantities; student R.I.B.A., moderate salary.—Box 4495, BUILDERS' JOURNAL Office.

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4493

BUILDER'S assistant disengaged, 21 years' experience, comprising office routine, plans, specifications, quantities, outside supervision; measuring-up, levelling and surveying; good references; abstainer—L. J. Greaves, Prestwood, Great Missenden, Bucks. 4494

BUILDER, with nine years' experience in first-class house-building and general repairs, desires appointment; fair draughtsman, well up all trades, tradesman; moderate salary; highest references. —Box 4507, BUILDERS' JOURNAL Office.

BUILDER'S Clerk (24), seeks situation; 7 years' London experience. P.C. jobbing wages; schedule work and assist estimates; good refs.—B., 11, Belitha Villas, Barnsbury, N. 4404

BUILDER'S Assistant (24), 8 years in and outdoor experience with large London contractor; quantities, general office routine; assist estimating and supervision.—Box 4401, BUILDERS' JOURNAL Office.

CARPENTER and joiner wants work; bench fixing, alteration, or jobbing. Could take charge of general work. Life abstainer. Good references. Age 32. Very energetic.—Pearson, 53, Hartham Road, Isleworth, W. 4471

CLERK of Works; age 30; practical and reliable; exceptional experience with buildings, plans, etc.; architectural training; would serve part time in office; cyclist.—Box 4464, BUILDERS' JOURNAL Office.

ENGINEER wants post, London or provinces; 12 years' experience; or undertakes preparations, calculations, quantities, designs, detail drawings, structural steelwork, and reinforced concrete.—Box 4451, BUILDERS' JOURNAL Office.

ESTIMATOR and building surveyor, Q.S.A., desires re-engagement with builder, architect, or surveyor; permanent or temporary; estimates, quantities, measurements, variations and accounts.—A 768, Fulham Road, London, S.W. 4501

EXPERT all-round Engineering draughtsman (over 10 years' experience) wishes for occasional work at his own home, or otherwise; lowest terms.—Freeman, 44, Horsell Road, Highbury, N. 4416

FOREMAN painter and decorator (well-experienced) wants re-engagement; not afraid of work. First-class references. Age 37.—Foreman, 16, Gambole Road, Garratt Lane, Tooting. 4431

FOREMAN of painters and decorators, take entire management of flats or estate; town or country; well up in all branches of building trades; total abstainer.—C/o G. N., Sanitary Works, Bridge Road, Chertsey. 4420

FOREMAN seeks engagement; shop or building; carpenter, joiner, practical, machinery, quick setter out; last refs. 7 years; age 38.—C. M., Cedars, Spring Road, Kempston, Bedford. 4483

GENERAL Foreman, of large and varied experience, thoroughly conversant with every branch of the trade, pushing and punctual; open to undertake any job; none too large; wages moderate.—J. M., 22, Eve Road, Tottenham. 4466

GOOD shopfitter and case-maker requires constant job; abstainer; refs. if required. Indoor hand. — Box 4388, BUILDERS' JOURNAL Office.

IMPROVER (Plumbing, Gasfitting), wants situation. Willing to fill up time.—A. R., 344, Commercial-road, Old Kent-road. 4455

JUNIOR Draughtsman (19), desires re-engagement; assist generally; good refs.; town and country; shorthand; probationer; R.I.B.A. — C. Weston, The Laurels, Rotherfield, Tunbridge Wells 4376

JUNIOR Assistant (20) requires situation in surveyor's or builder's office, 3 years' experience with London surveyor; can assist in abstracting, working up, variations, etc.; willing worker.—W. Cooke, 102, Faraday Road, Wimbledon, S.W. 4333

MACHINIST seeks permanency; work spindle, planer, tenoner, morticer, dovetailer, sharpen saws, make cutters, take charge of small plant; country job preferred. — Machinist, 39, Cathnor Road, Shepherd's Bush, W. 4504

PLUMBER (Registered) wants re-engagement as leading hand or otherwise. Thoroughly practical in all latest sanitary improvements. Town or country.—R. P., 18, Chertsey Street, Tooting, S.W. 4482

PLUMBER, gas, hot water, lead-laying and sanitary, wants job, or constancy; town or country. —S. W., c/o Editor, Box 4510, BUILDERS' JOURNAL Office.

SANITARY work wanted by practical man, 16 years' experience, iron or earthenware, capable to take charge, or would give estimate for good work; good references; age 40; abstainer.—Box 4499, BUILDERS' JOURNAL Office.

SHOP Foreman of joiners seeks re-engagement experienced, machinery, abstainer; reference; 12 years last situation; age 40.—T. R., 19, Second Avenue, Hendon, London, N.W. 4488

THOROUGHLY competent builder's book-keeper and general assistant requires engagement, 12 years' experience in London with builders and shopfitters; good reasons for leaving present berth; excellent references Age 32.—Apply Box 4414, BUILDERS' JOURNAL Office.

TO Property Owners.—Situation wanted on an estate or tenement property by a reliable man, aged 40, with a thorough practical experience of all repairs; capable of taking sole charge; distance no object.—Box 4503, BUILDERS' JOURNAL Office.

YOUNG Engineer (married), four years' Canadian experience, general engineering and concrete work (reinforced); returning to England, requires appointment; references from Can. Pack Railway Apply T. B., 2, Grange Road, Ealing. 4500

YOUTH (age 18) requires situation in builder's or surveyor's office. Desirous of learning estimating. Three years' previous experience.—Apply W. B., 8, Medley Road, West Hampstead, N.W. 444

YOUTH seeks situation with architect or builder good tracer, well up in p.c. and office work; excellent references.—J., 164, Wellesley Road, Ilford Essex. 448

Appointments Vacant.

EXPERIENCED representative wanted by well known firm of lock manufacturers; must have influential connection amongst leading architects and contractors in London district; state salary required and full particulars of experience. — Box 4427, BUILDERS' JOURNAL Office.

TRAVELLER wanted, with established connection amongst architects, builders, contractors, decorators, etc., to sell our Artificial Marble, on salary and Commission; must have exceptional reference as to ability. Apply by letter only, giving full particulars, and stating terms required, The Fassi Marble Company, Ltd., 46, Cannon Street, London E.C. 444

WANTED, for a permanency in the office of an old established firm of surveyors in the city, a youth of good appearance and education, with previous office experience, who can write a good hand quick and accurate.—Apply, in own handwriting with copies of testimonials, stating salary asked to Box 4457, BUILDERS' JOURNAL Office.

Business Wanted.

WANTED, a jobbing builder's business in London suburbs preferred. Apply, stating all particulars to Box 4415, BUILDERS' JOURNAL Office.

Businesses for Sale.

FOR Sale, a good old building business, in town of 10,000, at about £2,500, most of which could remain at 5 per cent. to good men; the business would suit joiner, bricklayer and painter; up-to-date shop and machinery.—Applicants for extended payment terms, must state amount of capital, age and class of work used to; good references indispensable.—Box 4452, BUILDERS' JOURNAL Office.

JOBBING builder and decorators' business Suffolk; old-established; freehold house and premises for sale.—Box No. 4475. BUILDERS' JOURNAL Office.

Partnerships & Practices

AN Architect and Surveyor practising in Essex anxious to collaborate or enter into partnership with another architect practising within easy distance of Chelmsford. — Apply "Essex," Box 4508, BUILDERS' JOURNAL Office.

Dissolution of Partnership

MR. A. E. TUTTE, architect and surveyor, having dissolved partnership with Mr. Cook (Cook & Tutte) and closed the offices at 394, Commercial Road, Portsmouth, has opened offices at 91, London Road, Portsmouth. 4

August 26, 1908. Volume 28, No. 707

Architect and Client.

Two questions in our "Enquiries Answered" columns bring to mind the very anomalous position occupied by the architect before the law. One correspondent raises the old, old question about the legal possession of plans; another has, unfortunately, discharged the functions of an architect without previously entering into a definite agreement with his client, and he is now apprehensive about his title to his fees—which, by the way, are less than half what they ought to be. In such circumstances it is not easy to give comforting advice. Before the law, the architect is a pariah—he has no standing and no rights. Reading over an old judgment recently we perceived underlying the learned judge's remarks a train of thought that might be rendered thus:—"Here is this man, calls himself an architect, and claims fees—£300! For what? Did he erect the building? Did he supply the materials of which it was built? Did he supervise the putting together of those materials? Well, he came and looked at the work now and then. What else did he do? Made a few lines on a piece of paper—I could do that myself. Says he is paid for his abilities as an artist. But even an artist puts the colours on the canvas or carves his figure out of the marble. This man's work is about equivalent to palmistry; but as architecture is not declared illegal, and the defendant was fool enough to employ him, he must pay something. How much? Five per cent.? Oh, no! Say, seventy-five pounds, and no order as to costs." That is not an exaggerated interpretation of the kind of judgment that has been given in our courts when an architect has had the audacity to sue for his fees. The Royal Institute scale is binding on no one but the members. Judges in the High Courts have stated quite emphatically that they did not intend to be bound by it, or even to consider it. The bricklayers' trade union may stipulate for a certain wage to their members, and the requisition will be listened to with respect; but no judge would entertain for a moment the opinion of architects, as a body, concerning the correct remuneration to be paid to one of their number. Clearly, the architects are self-interested and therefore biassed; but of the bricklayers' trade union no such suspicion can be entertained! Even in the case of the possession of plans, the same feeling runs. An architect's skill as an artist is too intangible to be paid for; it is his plans that the client must have. They are material, they can be seen, felt, handled, and reused, when necessary, without the payment of further fees. That is the law—for architects—and so it is likely to remain unless the R.I.B.A. bestirs itself to obtain for its disciples equitable treatment, to say nothing of proper recognition and respect.

The Builder's Ungenial Critics.

Adaptation to environment is not a conspicuous characteristic of modern building. It was recently remarked by a writer in these pages that "the charm of the English village"—and of course the observation would admit of a far more extensive purview—depends greatly upon the fact that its old buildings are indigenous; they are almost entirely the product of the soil upon which they stand, and hence they harmonise beautifully with their surroundings. Modern country houses seldom comply with this essential condition of æsthetic charm. They are apt to present the appearance of having been "dumped" from foreign parts. As a matter of fact, nearly all their units of construction have travelled many miles by railway. Hence the incongruous and intrusive appearance of the White City at Shepherd's Bush, and hence the impossibility that any Garden City can ever fully satisfy the eye of the artist. Buildings that do not spring from the soil must always lack "the grace of congruity," in spite of picturesque design, and in defiance of the softening effects of the great age which, it may be conceded, their soundness of construction will enable them to reach. We claim no originality for these statements. They are current commonplaces, and have been very much in evidence during the present holiday season. Moreover, while admitting the facts, we cannot pretend to deplore them overmuch. This is surely one of the many cases in which sentiment must yield to expediency. It is a common experience that the country cottage that is loveliest to look at is the worst to live in. While heavenly fair to outward seeming, the hovel may be within a veritable inferno of disease and discomfort, its atmosphere may be stifling, and its lack of sanitation utterly barbarous, its ravishing thatch may teem with the germs of a dozen deadly diseases, and may catch fire by spontaneous combustion; and a logical conclusion to the indigenous building theory would be the production, in some districts, of the picturesque but primitive mud and turf hut. Visual gratification is not the whole duty of the modern builder. He is not bound to be picturesque, but he is under many obligations to be practical. He is largely controlled by considerations of cost, and is governed in almost every operation by the enforcement of by-laws that prescribe or restrict size, form, or materials—any or all of them. He may not, hampered and harassed, and necessarily hard-headed and prosaic, as he is, succeed in charming the supersensitive eye of the amateur of æsthetics; but he is bound to produce a dwelling that will pass the test of the sanitary inspector, that, on the whole, is a healthy, comfortable and convenient home, and that, to the normal eye of the average person, is, in most cases, by no means hideous to look upon. He thus ministers to a solid satisfaction of the mind, and can therefore afford to regard with equanimity the abuse heaped upon him and all his works by those exquisite and lofty idealists who, at this season of the year, are allowed to fill the columns of the daily newspapers with cheap copy and cheaper sentimentality.

A Lady Critic of Country Cottages.

The feminine point of view as to the planning and internal arrangement of a dwelling has been often ably represented, and has no doubt afforded architects many a useful hint, as well as much searching of heart. It is obviously a matter upon which we are bound to defer to the ladies, even when we are reluctantly compelled to deny ourselves the pleasure of complying with their requests; for who should know the housewife's needs so well as she herself? "A Woman," writing in a northern contemporary, makes some very palpable hits with respect to the "domestic interiors" at the North of England Model Cottage Exhibition at Walker-on-Tyne. The model cottages there (of which, by the way, we show a few designs on pages 140 and 141 of the present issue), "A Woman" declares, repeat, in many instances, "old-fashioned, clumsy methods of doing things." She does not like the common form of copper or furnace-pan into which the water has to be laboriously poured, and from which the suds must be as tediously baled out. She suggests for the filling a conduit or pipe, and for the emptying a plug. This is doubtless very good doctrine; but, as usual, the difficulty arises in the attempt to apply it. The sinks excited the critic's "unholy derision." They are so small that she regarded them as

mere toys. She admires the exhibition committee's insistence on having a bath in every cottage, but, holding that the ideal position for a bath is on the bedroom floor, she objects to its being placed "in the scullery, sometimes close to the back door, or by an unplastered brick wall, in such positions as make one shiver for the bather in winter!" She further contends that a bath placed in a scullery should be accessible from the passage or hall, so that it may be reached without passing through the living-room. Then, as a matter of course, the critic complains about the storage accommodation, thus confirming the architect's impression that women are insatiable as to cupboards and wardrobes. This lady particularly demands a bicycle cupboard. Also she deprecates the absence of lobbies. "In some of the roomiest and most attractive cottages there is practically no lobby worth speaking of. You simply open the door, and a step brings you to the foot of the stair or to the door of the living room. "This is so sudden!" as other ladies are understood to have remarked in somewhat different circumstances. "There is not even room to bestow a wet umbrella, and one wonders how the doormat is to be placed." She bans the tiny panes shown in some of the upper sashes. They may be very pretty to look at, but they are very tiresome to clean. Finally, she condemns venetian blinds as dust-traps. She thinks that in order to secure these reforms, "what is needed is a lady architect, . . or, failing that, an architect who is married and not above taking his wife's advice about things that she knows better than he does." Surely these are desperate alternatives. We are credibly informed that in these hard times many architects are too poor to marry; and that a woman's ideal equipment for a cottage would cost about twice as much as the rearing of the structure.

London Building Act Amendments.

It was unofficially announced, last Thursday, that the Building Act Committee of the London County Council have decided to recommend to Parliament, next session, an amendment of the Building Acts, by which in the case of buildings constructed by reinforced concrete lower minimums of wall-thickness will be sanctioned. This somewhat tardy recognition of the obvious fact that walls constructed of reinforced concrete need not, to ensure stability, be nearly so thick as those of brick and stone, is mere justice, and comes as a welcome relief from an intolerable burden to practitioners of the modern system of building, whose operations have been hitherto greatly thwarted and hampered by absurdly inapplicable restrictions; and, by stamping the new system with the hall-mark of official sanction, it will remove the last lingering doubts of hesitating capitalists, and give an immediate impetus to building. Readers of this journal need not be reminded that modern enterprise in the building of huge business premises is hampered by other antiquated regulations that ought to disappear if the revision of the Acts is to be at all adequate to modern conditions. There is, for instance, the rather galling insistence on the division into comparatively small apartments of business premises in which large rooms are essential. It is to be hoped that this matter, and other details of importance, will receive due attention in the revision; the draft of which is awaited with keen interest.

Notes on Competitions.

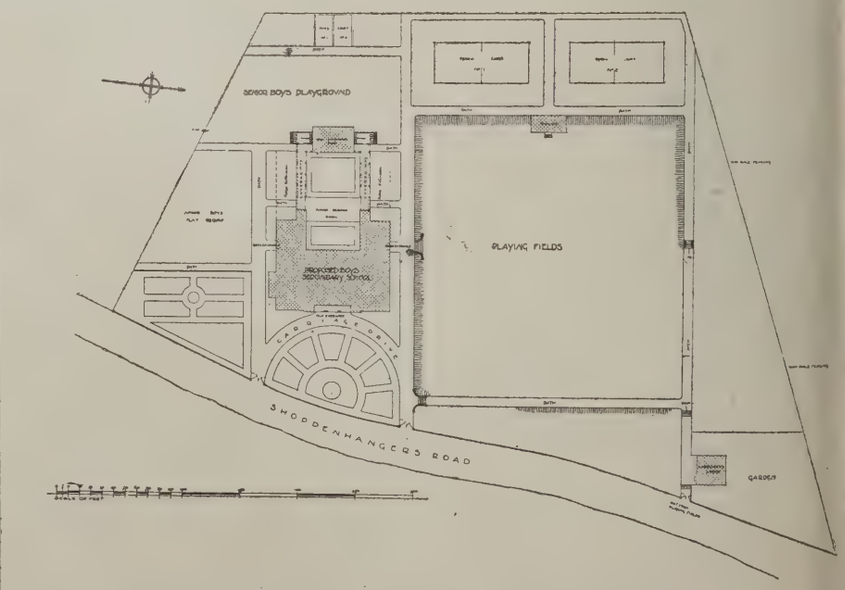
LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Aug. 31	PARISH CHURCH AT BISHOPSWEARMOUTH.—Limited to Sunderland architects. Conditions from H. E. Hinckley, 68, Cleveland Road, Sunderland. Deposit one guinea.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Oct. 7	BOAT SHELTER, INVERNESS. Engineers invited to submit plans for a scheme, not exceeding, in cost, the sum of £10,000. Conditions from Kenneth Macdonald, Clerk to the Harbour Trustees, Town House, Inverness.
Oct. 31	*COUNTY HIGH SCHOOL FOR GIRLS' ROMFORD.—Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
No date.	SITE-PLAN FOR COTTAGE EXHIBITION, SWANSEA, 1909. Gold, silver, and bronze medals, together with sums of £20, £15, and £10. Particulars from Henry R. Aldridge, Secretary to Exhibition, 7, Gower Street, Swansea.
No date.	*COUNCIL CHAMBERS AT BELLSHILL, BOTHWELL. To cost £2,000. Site plan and conditions from Robert Anderson, Parish Council Offices, Bellshill. Deposit one guinea.

** These competitions have been unfavourably reported upon by Correspondents.*

Unfair Competitions.



A Glasgow Correspondent writes as follows:—

I see from the columns of your valuable paper that you take up a strong position on the conduct of architectural competitions. May I, therefore, suggest that in your weekly list of competitions open you only include such as issue reasonable conditions and give no countenance or free advertisement to those who seek to take unfair advantage of the architectural profession. It would probably save a good deal of correspondence and annoyance to your readers who generally have to lodge a deposit in sending for some conditions of competition which are only fit for th waste paper basket. For instance, yo mention in your last two issues the Bells hill Competition, for which no architec with respect for his profession will com pete. On inquiry, you will find that th conditions in connection therewith pro vide for a fee to the successful architec of 3½ per cent. on the total probable cos £2,000. The above percentage is to cove beyond all ordinary services three sets c plans. No premiums are to be awarde in competition, and the only suggestion c an assessor refers to one who will repo on the "estimates," which seem to be th principal consideration. Plans, includin enlarged details, are to be submitted b September 1st, within about three week of first notice, while, of course, there the usual £1 deposit to lodge before or can see the conditions. It is to be hope that architects will bestir themselves, an do something by way of protesting again and exposing competition methods an conditions such as the above, and by a means abstain from encouraging same b competing.

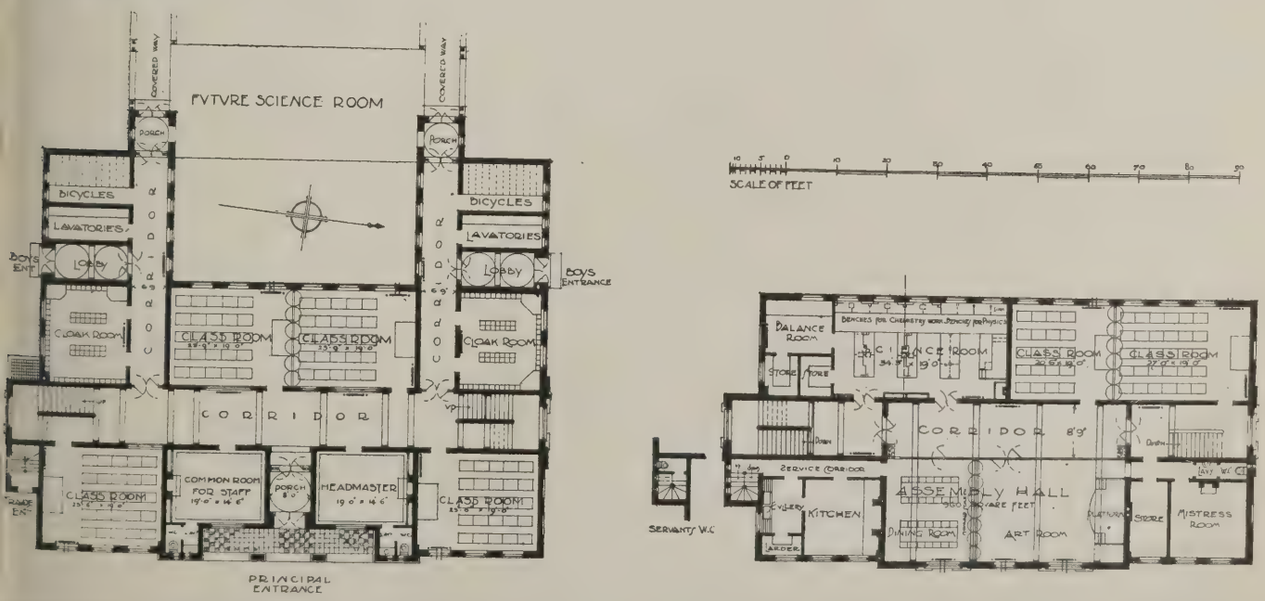
[Our correspondent will see that we hav adopted his suggestion so far as to st in our list those competitions that hav been unfavourably reported upon b correspondents. More than that we ca hardly be expected to do. There is, u fortunately, no way by which we ca obtain information earlier than o readers as to the conditions of any com petition announced in our column Though we apply for a copy of the co ditions in such competition, we a seldom favoured with it, and we a dependent, therefore, on information r ceived from intending competitors. is hardly necessary to say that it usually the promoters of unfair comp titions that are most chary of forwar ing a copy of the particulars and cond tions. We shall be pleased to give pu licity to complaints respecting any com petition, but our correspondents mu send also the printed conditions, as proof that their statements are we grounded. These will be returned i mediately after perusal.]

Secondary School, Cleckheaton.

In the architects' competition in desig for the new secondary school at Clec

SECONDARY SCHOOL FOR BOYS. MAIDENHEAD DESIGN PLACED SECOND. BLOCK PLAN.

heaton, it is reported that 64 sets of plans have been sent in. The services of an expert assessor have been engaged, with whose advice the committee will make their selection.



Convalescent Home, Worthing.

A design submitted by Mr. E. L. Lunn, of Guildford, has been selected for the Royal Surrey County Hospital Convalescent Home at Worthing. Six designs were received, and the selection appears to have been made by the Hospital Committee without professional assistance.

Workhouse Extension, Dudley.

Mr. C. E. Bateman, F.R.I.B.A., of Birmingham, the assessor in the above competition, has delivered his report. The first place is awarded to Design No. 25, submitted by Messrs. Nicol and Nicol, of King's Court, 117, Colmore Row, Birmingham, and special mention is accorded to the authors of designs Nos. 22, 23, 28, 26, and 31. The assessor recommends the successful design for erection.

COMPETITION FOR A SECONDARY SCHOOL FOR BOYS, MAIDENHEAD. DESIGN PLACED SECOND. WALLIS AND BOWDEN, ARCHITECTS.

This design was placed second out of 145 designs submitted. The assembly hall is situated on the first floor, and is so arranged that it can be used as an art room (with north light) and a dining room at the same time, each room having direct separate access; it is also planned so that it can be enlarged on special occasions by folding up the partition dividing it from the corridor adjoining. The dining-room is served direct from the kitchen adjoining, and the mistresses' room can be used as a retiring room from the stage. Separate entrances have been provided for the senior and junior boys, each having cloak, lavatory, and bicycle accommodation. Special attention was paid to the future extension, which can be easily obtained on the ground floor, without interfering with the light to any of the class-rooms or the corridors. The estimated cost is £5,075.

Proposed New Works.

L.G. Board enquiries into proposed expenditure by public bodies have been recently held with regard to the following works:—

Water supply works and plant: Acton U.D.C., £572; Billinge U.D.C. £12,000, including construction of two reservoirs to hold 8,000,000 and 144,000 gallons respectively (August 26); Oswaldtwistle U.D.C., £4,010 (August 25); Hexham R.D.C., £1,200 for Corbridge (August 25); Danby R.D.C., £300 for Ainthorpe, £200 for Castleton (August 25); Gas undertakings and plant: Oswaldtwistle U.D.C., £2,530 (August 25). Bridge construction and widening: Sunderland B.C., £2,010 (August 25). Sewerage, drainage, and sewage disposal works and plant: St. Mellon's R.D.C., £5,500 for Rogerstone (August 28), Northallerton U.D.C., £8,950 (August 27); Hatfield R.D.C., £5,000 (August 26); Acton U.D.C., £5,000 (August 25); Halifax B.C., £9,000 (August 26); Whitchurch U.D.C., £160 (August 27); Swansea R.D.C., £13,000 for Sketty (August 25); Llandaff and Dinas Powis R.D.C., £6,841 for Llandaff (August 26); Oswaldtwistle U.D.C., £4,880 (August 25). Street improvements, new roads, public parks, and pleasure grounds: Oswaldtwistle U.D.C., £4,000 and £3,300 (August 25); Flixton R.D.C., £867 (August 25). Various: Sunderland B.C., £3,809 for public baths and washhouses (August 26); Llantrisant P.C., £3,500 for burial ground (August 27); Acton U.D.C., £19,100 for public offices (August 25); Sunderland U.D.C., £1,288 for underground conveniences (August 26); St. Pancras B.C., increase in housing scheme (August 24).

A conference of chairmen and vice-chairmen of committees of Sunderland Corporation, convened recently for the purpose of dealing with the unemployment of the district, decided to recommend the further extension southward of the sea wall at Roker, and to obtain estimates for the construction of two salt water baths at Roker—one (for men) to be 110ft. by 30ft., and the second (for women and children) 70ft. by 20ft.

For the work of constructing the new central public library for Walthamstow, towards the cost of which Mr. Andrew Carnegie has given £10,000, Mr. J. Williams Dunford is architect.

An assembly hall is to be erected at Horsham, at the estimated cost of £2,750.

The Hampshire County Council offices at Winchester are to be enlarged, and the Surveyor is to prepare detailed plans and estimates for the work, and lay them before the November meeting of the Council. Mr. T. G. Jackson, R.A., or some other eminent architect, is to be consulted as architectural advisor.

A report on the condition of the church at Natland, Kendal, prepared by Messrs. Austin and Paley, of Lancaster, states that the fabric is nearly beyond repair, and the erection of a new church, at a cost of £4,500, recommended. As £3,000 has been already subscribed by two donors jointly, the parishioners have decided to make early application for a faculty.

For the construction of a new lock at Portsmouth Dockyard, the tender of Messrs. Morrison and Mason, of Glasgow, has been accepted; £940,000 is to be spent on structural works, entrance caissons, etc., and £60,000 on machinery. The lock is to accommodate a ship 850ft. long, but including the caisson and outer works the total length will be 921ft. A 110-ton crane will be erected near by. The lock has been designed, and the plans and specifications have been prepared, by the Naval Works Department at Portsmouth.

Stockport has accepted Mr. Andrew Carnegie's offer of £10,000 towards the cost of constructing a free library.

The Boys' Charity School, Sheffield, has been conducted, since 1810, in a building overlooking the parish churchyard. For some years the trustees have been anxious to erect a more suitable building on their freehold field in Psalter Lane, and now that a lady has given £4,500 for this purpose, the project will no doubt soon materialise.

A municipal building scheme that will probably be placed before Dunfermline Town Council next month provides for the erection of fifty cheap houses for workmen. A sketch plant outlining the scheme has been prepared by Mr. A. W. Bell, the burgh engineer.

Chichester's ancient Guildhall, in Priory Park, is to be thoroughly repaired in accordance with specifications that have been prepared by Mr. Prior. The amount to be spent on the work depends on the sum that can be raised by public subscription. The money in hand is about £560.

A Garden City or Model Village at Totley Rise, near Sheffield, is proposed, and a preliminary prospectus has been issued.

Correspondence.

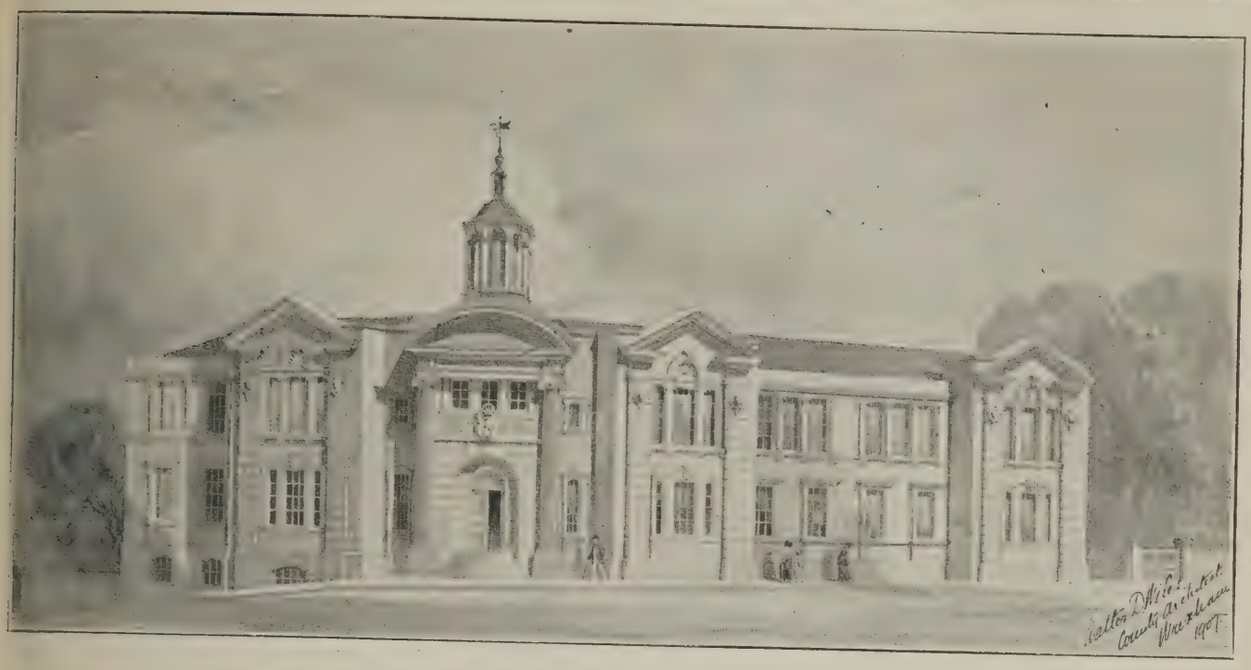
Romsey Abbey.

To the Editor of THE BUILDERS' JOURNAL.

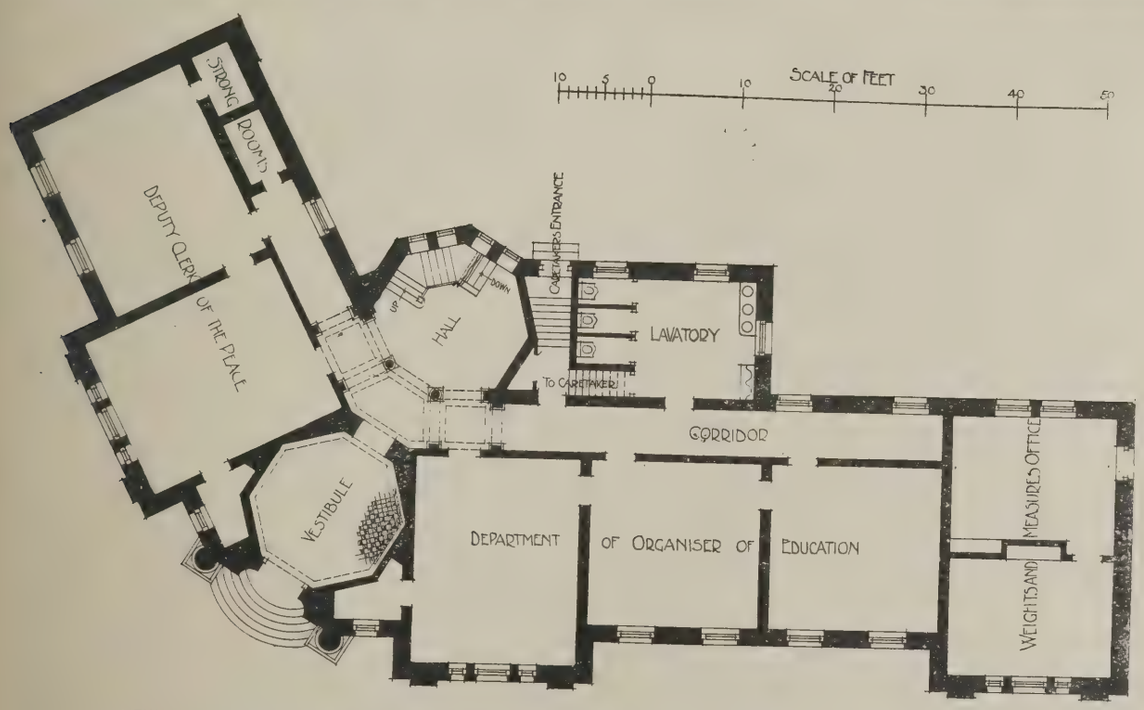
SIR,—Your leader in last week's issue of THE BUILDERS' JOURNAL, concerning Romsey Abbey, reveals a state of things which should cause us shame. So simple a proposal as the erection of a new porch is gravely stated to be "greatly disturbing the minds of the lovers of ancient buildings," and the inference is plain that the opponents of the scheme consider that in all England no architect can be found capable of carrying out a structure on even so modest a scale as this, and joining it on to the older work. This is a confession of ineptitude resulting from that pernicious doctrine that what is old can never be surpassed. Curiously enough, these good people forget that nearly every great church in Europe took centuries to build, and contains specimens of the style of each successive period. Westminster Abbey was commenced by Edward the Confessor, and finished 700 years later by Wren—each century adding its quotum and taking no heed of what had gone before.

The mediæval builders were progressive in their art, and considered all that preceded their own development of it as obsolete and crude. Hence we find Norman chancels in hundreds of cases replaced by Early English ones, and so it was in the centuries which followed. But to-day we have been taught that we can do nothing worthy to be placed within a thousand miles of the work of our forefathers.

Romsey Abbey may or may not need a new porch. The point is essentially a practical one, and if there is a necessity for it, it is difficult to see why it should not be put up. And why should we stay our hand because there are no plans or data to guide us as to the design of the structure which it is supposed formerly stood there? A like dilemma did not prevent Inigo Jones from adding a Classic portico to Old St. Paul's, and it is certainly not on record that the then Chancellor "wisely decided to defer judgment . . . and in the meantime fortify himself with the opinion of experts!" And ye Inigo Jones holds a very sacred place among the disciples of this school—merely one must suppose, because he has been dead these 250 years.—Yours truly,



FREDK. CHATTERTON.



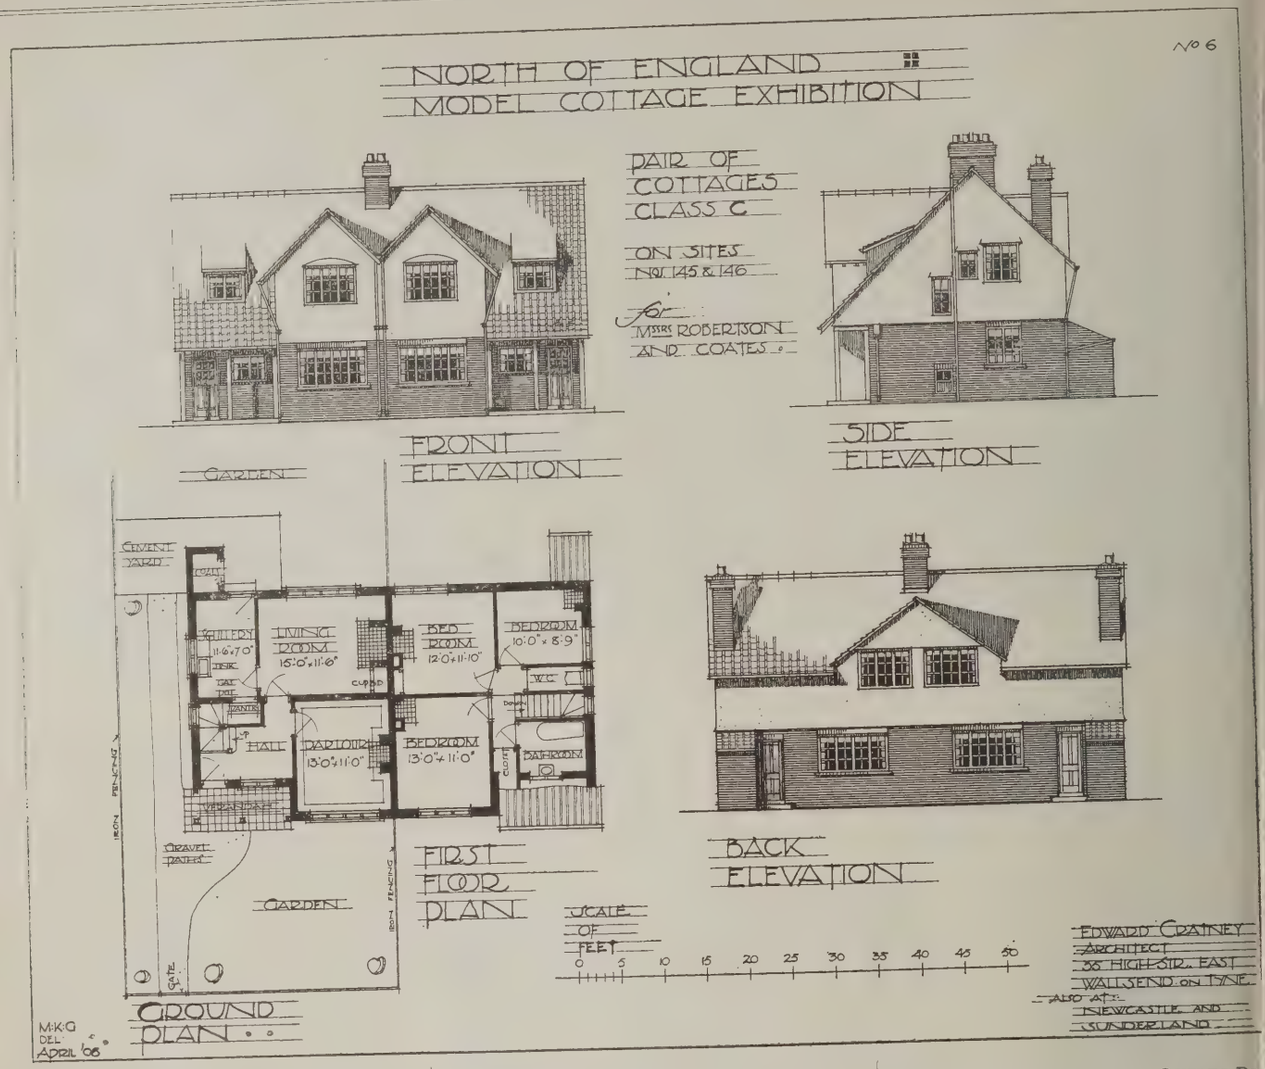
[Our correspondent has read more into our leader than we intended it to convey and we submit that our remarks were perfectly innocent of even the germs of the heresies developed in his somewhat strained inferences. Certainly we have very robust belief in the skill and taste of modern architects, and we think that our correspondent might have been more just to our point of view if he had exercised upon the following passage his extraordinary powers of inference: "Sentimentality is apt to run riot against every attempt, wise or foolish, at restoration." Surely he might have deduced from this that we are not to be classed among the extremists, but are disposed to adopt a judicial attitude, and to treat each case as "wise or foolish"—or neither, according to its particular merits.]

NEW COUNTY OFFICES, RUTHIN.

These offices, which are now in course of erection by the Denbighshire County Council to meet the requirements of the Education officials of the county, are being built from the designs and under the supervision of their county architect and surveyor, Mr. Walter D. Wiles, on a site presented by the Ruthin Town Council who have also placed their local limestone quarry at the disposal of the County Council. The building comprises, in the basement, storage rooms, heating chamber, etc. On the ground floor is a octagon vestibule, 16ft. in diameter, with the main staircase beyond, both panelled and fitted up in Austrian oak, and having polished granite columns. The rooms on this floor are for the use of the Deputy Clerk of the peace, and the Organiser of Education. Attached to this floor is lavatory accommodation for the use of the whole staff. On this floor level, but not communicating, are the Weights and Measures offices for the western part of the county. On the first floor, over the main staircase, is a small colonnade of polished granite columns, and the rooms are for the use of the Clerk of the Peace and Education staff. Four strong-rooms for the various departments, and a caretaker's residence, are provided. In the construction local limestone facings, with dressings of Runcorn stone, have been adopted. The main entrance is flanked on each side with polished emerald pearl granite columns 22ft. high. The steps are of Idle stone and the roofs covered with green slates. The general contractor for the work is Mr. William Hopkins, builder, of Birmingham. The heating, which is on the low-pressure system, is by Messrs. Dilworth and Carr, of Preston. All the floors are of reinforced concrete, by Messrs. Homan and Rodgers, of Manchester.

THE FORMAL RESIGNATION OF THE BRADFORD CITY ARCHITECT, Mr. F. E. P. Edwards, was read at a meeting of the Finance Sub-Committee of the Bradford Corporation on August 21st, and was accepted with an expression of regret at the loss of his services. Mr. Edwards states in his letter that he is to be allowed by the Sheffield Corporation to visit Bradford as often as he may deem it necessary until the Town Hall extension has been completed.

NEW COUNTY OFFICES, RUTHIN. WALTER D. WILES, COUNTY ARCHITECT. (*See opposite page.*)



Buildings in Progress.

dditions to St. Andrew's Parish rch, North Berwick, have been built m designs by Messrs. Henry and Mac-aan, of Edinburgh, and have cost rly £3,000. They include a new ch, in the tympanum of which is a re of St. Andrew carved by Mr. W. nie Rhind, R.S.A., while a tower 18ft. are on plan is 93ft. high. The style arly English.

he interior of the parish church of ston-in-Gordano has been carefully re-ed, under the direction of Mr. F. Bligh d, F.R.I.B.A., of Bristol. The carved bbean pulpit, which had been painted has been cleaned and oiled and restored to its original purity, a framed modern dado round the walls has been removed, and the masonry pointed to correspond with the other work. The interior arch of the south porch has been repaired, and the adjoining piscina uncovered and cleaned. The Sanctus bell has been repaired and rehung, and the masonry carrying it has been restored. In preparing to lay red encaustic tiling in the nave, the slabs of two small altar tables were found beneath the old stone floor. They are of polished stone, incised with five crosses, and decorated with scroll-work of blue fresco.

The New Hippodrome at Middlesbrough, which was opened on August 15, will hold 3,000 persons. It is built of red brick, with buff terra-cotta dressings. Mr. G. F. Ward, of Birmingham, is the architect, and Messrs. J. Parkinson and Son, of Blackpool and Newcastle, are the builders.

The Temple Church, London, E.C., which will be re-opened in October, is being rather extensively repaired internally. The altar, which was erected in 1682, and reconstructed in 1840, is being raised 2ft. from the ground, as also is the reredos. The latter shows carving by Grinling Gibbons. A new communion-rail of Purbeck marble is being erected. This will be quite innocent of decoration, to be in keeping with the columns of the same material supporting the inner circle of the church roof. The east window is also being repaired.

Torrington's new hospital, of which the foundation-stone has just been laid, is estimated to cost £1,190. It will comprise only two wards, one for males and the other for females, and each ward will contain two beds. The building will be of local stone, with brick facings. Mr. W. C. Medland is the architect, and Messrs. Charles Heard and Son, of Torrington, are the builders.

The Parish Church of St. Cuthbert, North Meols, Southport, is to be renovated and extended at an estimated cost of about £2,500. The present building was erected in 1730, but the foundation dates from Norman times. The architect is Mr. Isaac Taylor, F.R.I.B.A., of Manchester, and the contract is in the hands of Mr. J. Pilkington, of St. Helens.

A new Wesleyan Methodist chapel at Pateley Bridge, Yorks, of which the foundation-stone has just been laid, has been designed in the Decorated style, by Messrs. W. J. Morley and Sons, of Bradford and London. The contracts are let to various local tradesmen, and the total cost is estimated at £2,500.

The architect for the new Benedictine Abbey to be built at Dulwich is Mr. J. N. Comper, and it is stated that the work is to begin almost immediately.

Westminster Roman Catholic Cathedral is undergoing improvements to the interior in view of the coming Eucharistic congress. The workmen engaged include a number of Italians, who are employed in the decoration of the great galleries.

Notes and News.

BARGAINS IN BRICKS may now be effected in the Peterborough district, where, it is reported, a certain class of brick, much in demand at 28s. per thousand a couple of years ago, is now going a-begging at 8s. per thousand. Millions of bricks are in stock, yards are being closed, and plant dismantled.

* * *

ROYAL SANITARY INSTITUTE LECTURES to be given at the Parkes Museum, Margaret Street, W., during the forthcoming session, which begins on October 7th, include three by Mr. H. D. Searles Wood, F.R.I.B.A., on sanitary building construction and planning, and soil and local physical conditions, and four by Mr. John Edward Worth, M.Inst.C.E., district engineer to the London County Council, on sewerage, sewage disposal, scavenging, and the disposal of house refuse. Single lectures will be given as follows: Mr. Henry Adams, M.Inst.C.E., on calculations, measurements, and plans and sections; Mr. J. Osborne Smith, F.R.I.B.A., on ventilating, warming, and lighting; Mr. J. Wright Clarke on the details of plumbers' work; and Mr. W. C. Tyndale, M.Inst.C.E., on house drainage. There are also the usual lectures on elementary statics, on physics, chemistry, and meteorology, on sanitary law, and on the duties of sanitary inspectors.

THE REBUILDING OF THE QUEBEC BR is being undertaken by the Cana Government. A board of three emi engineers will be appointed to pre plans and superintend the construct

* * *

ERRATUM.—By an unfortunate graphical error, the address of M Richard Crittall and Co. was given in announcement of last week as " Wardour Street. Messrs. Crittall asked us to state that their address i 197, Wardour Street.

* * *

WEIGHT OF CRUSHED STONE.—A ence to any engineer's hand-book wil the weights of a unit volume of v kinds of stone, but the allowance made for the voids in a volume of cr stone is generally a matter of discr Prof. Ira O. Baker, of the Univers Illinois, has lately conducted a ser experiments for the purpose of asce ing the proportion of voids in cr stone of various sizes, and the resul thus summarised:—The mean coef by which to multiply the weight cubic foot of solid limestone to obta weight of a cubic yard of crushed stone is as follows:—For ½-in. scree 15.5; for ½-in. to 2-in. stone, 14.6; fo to 3-in. stone, 15.2. For trap-ro corresponding coefficients are as fo —For ½-in. screenings, 14.6; for ½ 1½-in. stone, 13.5; for 1½-in. to 3-in. 13.9. Copies of this bulletin may tained gratis from Urbana, Illinois

ARCHITECT'S PROTEST AGAINST EDUCATION COMMITTEE.—Mr. Edward Holmes, architect, of Birmingham, has addressed a letter to the President of the Board of Education, in which he complains that, in his opinion, he has been treated unfairly by the King's Norton and Northfield Urban District Council, and its Education Committee, in denying him certain official information necessary to the statement of his case to the Board, in his proposed application for an inquiry into his dismissal "without just cause or reason, as the Council's and the Education Committee's appointed board's architect for the erection of the Cotteridge Council School buildings."

* * *

THE NOTABLE BUILDINGS AND BEAUTIFUL SCENERY OF TUNBRIDGE WELLS are most attractively represented in an excellent guide-book which has been prepared by Mr. W. H. Watts. The buildings illustrated include the remains of Bayham Abbey; the more or less remarkable castles of Tonbridge, Hever, Brambletye, and Penshurst; and several churches, old and new. The district, besides being rich in historical interest, is notoriously one of England's most admired beauty spots, and, both in letterpress and in pictures, Mr. Watts has made excellent use of his abundant opportunities. A special "Walks and Drives" supplement is contributed by Mr. F. Roberts. The book is published, price 6d., by Photocrom Co., Ltd., for the Tunbridge Wells Tradesmen's Association.

* * *

A tunnel more than a mile in length, said to be the longest in existence for use by municipal electric surface car lines, has just been opened for operation by the Genoa Street Railway Company. It connects Genoa with the adjacent large commune of Rivarolo. The constructive works were begun on June 1st, 1905. The boring was accomplished by 900 workmen, partly by hand, by electrical machines, and by compressed air machines.

* * *

TO PRESERVE THE STONEWORK OF WESTMINSTER ABBEY, a liquid is being sprayed over it, with the object of preventing further decay. The nature of this liquid is not stated, but it may be remembered that the late Sir George Gilbert Scott sought to harden the decayed internal surfaces by the application of shellac dissolved in spirits of wine. The western and northern side of the Great Cloister, which is now the scene of the spraying process, were built about 1380 by Abbot Littlington.

MIDLAND COUNTIES BUILDING TRADES EXHIBITION.—Competitions for students and apprentices are to be held in connection with this exhibition, which, as announced in our advertising pages, will be held at Bingley Hall, Birmingham, October 12th to 21st. A committee of architects have been responsible for the arrangement of the syllabus, and for the successful competitor a handsome certificate has been designed in line by Mr. Sidney H. Meteyard, of the Birmingham School of Arts. The entries for these competitions close on August 31st.

Obituary.

DEATH OF MR. H. H. STANNUS, F.R.I.B.A.

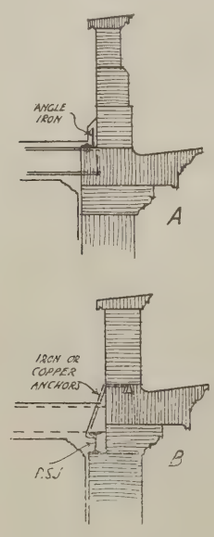
We regret to announce the death, at Hindhead, Surrey, of Mr. Hugh Hutton Stannus, F.R.I.B.A. A.R.C.A. Mr. Stannus was born at Sheffield, and studied at the local school of art. For some years he was lecturer on architecture and applied art at the Royal College of Art, South Kensington. He was also an attractive writer on art subjects, as well as a prolific lecturer and speaker. Noted for his devotion to Alfred Stevens, he wrote the life of that eminent sculptor, and was commissioned to superintend the completion of the Wellington memorial in St. Paul's Cathedral, which Stevens left unfinished. He was an active and a distinguished member of the Royal Institute of British Architects, of which he became Ashpitel Prizeman in 1873, Institute Medallist for Essays in 1877, Associate in 1880, and Fellow in 1887.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Qualifying as Civil Engineer.



BRISTOL.—G.H. writes: "Could you give me any information as to examinations to enable me to qualify as a civil engineer? I am anxious to take up studies in that direction?"

The aim of all aspirants in civil engineering should be to obtain the Associate Membership of the Institution of Civil Engineers. This would be of material advantage in any branch of civil engineering; but the examination is a very severe one, and requires great proficiency in mathematics. Particulars can be obtained from the secretary, Dr. Tudsbery, at the Institution of Civil Engineers, Great George Street, Westminster. If our correspondent desires to specialise in municipal engineering, he might study for the examination of the Incorporated Association of Municipal and County Engineers, which could be taken as a prelude to the other. Apply to Mr. Thomas Cole, secretary of the Association, 11, Victoria Street, Westminster. It is very desirable that "G.H." should obtain practical experience on engineering works, or that he should be apprenticed to a civil engineer.

Projecting Cornice.

PORTSMOUTH.—"PROVINCIAL" writes: "What is the London method for making safe the heavy cornices now in vogue? It seems nothing to have a cornice projecting 3ft. from an 18in. wall."

Cornices in London are not allowed to project more than 2ft. 6ins. over the public way, and must be weighted or tied down to the satisfaction of the district surveyor. The example shown in your sketch (not reproduced) would not appear

to be in need of any further security than that which is afforded by the parapet wall, or blocking course, shown, as it seems quite stable when worked out statically, as a cantilever. If the parapet were lighter, some additional means of tailing-down might be desirable, such as a section of steel joist or angle bolted to the ends of floor joists, as sketch A; or anchor ties might be fitted to a joist fixed at a lower level, as sketch B. There is no stereotyped method. G.

Stone Preservation.

EDINBURGH.—"W." writes:—"Some time ago I noticed that important experiments had been made by Professor Church, and that an elaborate report had been prepared by him on the subject of the preservation of stone. Can you direct me where this report can be obtained, and, if possible, advise as to the best approved preservative for free-stones?"

We believe this report was prepared for Parliament in connection with the preservation of the stone in the fabric of the Palace of Westminster. It can be obtained from Messrs. Eyre and Spottiswoode, Ltd., Government Sales Offices, New Street Square, London, E.C., or other Government publishers. We believe Professor Church recommends baryta water. At Westminster Abbey Professor Lethaby is using limewash—with satisfactory results.

Property in Sketch-plans.

NEWCASTLE-ON-TYNE. — "A.B.C." writes:—"I have prepared sketch-plans of business premises for clients in a distant town. After a lapse of some weeks, they inform me that they have decided to modify their original proposals, and to engage a local architect to act for them, and ask for my account. Can I legally demand the return of my sketch-plans?"

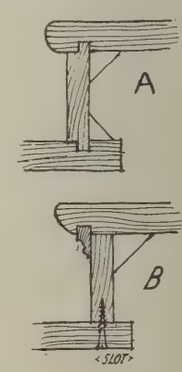
You cannot legally demand any plans or drawings from a client. A lawyer charges for verbal advice—and, very often, bad advice—which may cost his client hundreds of pounds if followed. But our lawyers and judges have held that an architect, in the absence of an agreement is not to be paid for his advice, but for the bits of paper upon which he sketches his ideas for the information of other people instrumental in the erection of a building. So your clients can retain your sketch-plans as proof that they have not been defrauded of their money. And if you have to sue for your fees, the learned judge will decide how much these pieces of paper are worth. Your skill, experience, or position in the profession have no part in this assessment.

Drainage of Country Houses.

SOUTHEND-ON-SEA. — "STONEWALL" writes:—"Will you advise me how to obtain information with respect to systems for the disposal of drainage from isolated country houses."

"The Drainage of Town and County Houses," by G. A. T. Middleton, A.R.I.B.A., 4s. 6d. post free from this office, has a chapter on disposal works; but there is no work devoted solely to this subject, and probably there will be none until the Royal Commission on Sewage Disposal issues its long-awaited report on artificial purification works.

Scale of Architects' Fees.



MANCHESTER.—"A.B." writes:—"I am a clerk of works, and was instructed to prepare plans for a pair of semi-detached houses estimated to cost £650. Additions by the owner will bring the cost to £700. It was necessary for me to prepare three sets of plans on tracing cloth, prepare the specification, and take off quantities. In addition, I issued eight sets of quantities, produced tenders, and wrote out acceptances, etc. I paid about twenty-five visits to the building to supervise the work, and prepared all details necessary for joiners, masons, etc. The work commenced in March, and is now nearly finished. A few weeks ago I sent in my account for £20 to cover all the above. My client seems to doubt my integrity. The job is prefectly satisfactory, and has his approval; but he thinks the account too large. Is the account too large for the work done? As my client doubts my integrity, I thought it better if another surveyor were employed to measure up the work. In that case, who would pay his fee?"

We do not consider that the charge is nearly enough. If "A.B." had charged according to the scale of the Royal Institute of British Architects (which we are strongly of opinion should be adhered to by everyone acting as an architect), his fee would be more than double that mentioned. In the absence of any agreement between "A.B." and his client, he must get what he can. If he sues for his charges, he may get £20 or 20 pence, according to the county-court judge's wisdom on the matter of architects' fees, though we think, in view of his low charges, he could hardly be awarded less than £20. If "A.B." employs another surveyor to measure up without the explicit consent of his client, the fee would have to be paid by "A.B."

Treads and Risers.

LETCHWORTH.—"J. C." writes:—"A few days ago I saw treads and risers fixed as sketch (A). I have never seen similar construction of treads and risers before. Will you kindly give me your opinion of it."

The construction is wasteful and bad. It is courting disaster to fix joiner's work in so rigid a manner, leaving no play for the movement caused by expansion

and contraction. If each complete step is put together in the usual way (as sketch B), and the bottom edge of the riser is fixed to the next tread below, only by screws working in slots in the back edge of the tread, it will be free to move slightly. Otherwise, the treads may crack in shrinking, or may draw the risers with them and break them away from the blocks.

Varieties of Mastics.

NEWCASTLE-ON-TYNE. — A.R. writes: "(1) Wherein does joiners' oil mastic differ from glaziers' oil putty? (2) What is the composition of slaters' mastic? (3) What is usually understood by 'mastic' in laying wood-block floors?"

Glaziers' oil putty consists merely of whiting ground in raw linseed oil; the various mastics are composed of a variety of substances, such as litharge, red lead resin, boiled oil, etc., which are mixed with fine sand, powdered brick, whiting etc. Another class of mastics have glu

for a base, and the composition varies considerably in different parts of ground slate and fine sand, with about 25 per cent. of litharge. These should be thoroughly mixed while dry, and then worked with, to a putty-like consistency, in boiled linseed oil—a little black or blue may be added if necessary to match the colour of the particular slate it is intended to repair. The following is a recipe for a waterproof mastic which is suitable for laying wood-block floors; but here, again, there are no definite formulæ: Mix together one part of red lead and six parts each of whiting and fine sand. When these are thoroughly mixed, work up to a putty or mastic with boiled oil. More whiting and less sand can be used if desired. A good mastic for general use can be made by mixing equal quantities of wood ashes, quicklime and pulverised brick, and working up in boiled oil as before mentioned. What is known as "Scotch mastic" is made on practically the same principle as the foregoing: Mix thoroughly fourteen parts of pulverised sandstone with three parts of whiting and one of litharge. Then amalgamate with linseed oil one part of boiled and two parts of raw. It will be observed that in each case sand, lime, or its equivalent is mixed with a strong drying agent, such as red lead, litharge, and boiled oil. The following is a favourite recipe which produces what is known as "London Mastic": Sift together 30 parts of pulverised stone or hard brick, ten parts of silver sand, and three parts of litharge. Then make these into a mastic by thoroughly incorporating with pure linseed oil—boiled and raw, half and half.

J.

Strength of Floor.

PAISLEY.—G. E. writes: "What should be the maximum distributed safe load, on a floor of a bonded store comprising 12in. by 6in. wood beam, with 11in. by 3in. joists at 18in. centres, supported on 6in. cast-iron columns?"

Say 9ft. spans for beam, $\frac{12 \times 12^2}{9}$ = 192 cwts., 192 × 1½ for continuous beam, = 288 cwts. gross, $\frac{20{\cdot}5}{2} \times 9 = 92{\cdot}25$ sq. ft. $\frac{288}{92{\cdot}25} = 3$ cwts. per ft. super. Say 10 ft. span for joists, $\frac{3 \times 11^2}{10} = 36$ cwts. gross, $\frac{36}{10 \times 1{\cdot}5} = 2{\cdot}4$ cwts. per ft. super. Therefore the maximum safe load on floor is 2½ cwts. per ft. super.

HENRY ADAMS.

CLYDE NAVIGATION TRUST'S BUILDING EXTENSION. FRANK BURNET, F.S.I., ARCHITECT.

The new portion of the Clyde Navigation Trust's premises in the Broomielaw, Glasgow, occupies the corner site between Robertson Street and the main Harbour thoroughfare. The Trustees' Hall, which occupies the second floor under the Dome, is circular in shape, and provides seating accommodation for more than 100 persons. The illustration is reproduced by courtesy of the *Glasgow News*.

A NEW WINCH FOR BUILDERS.

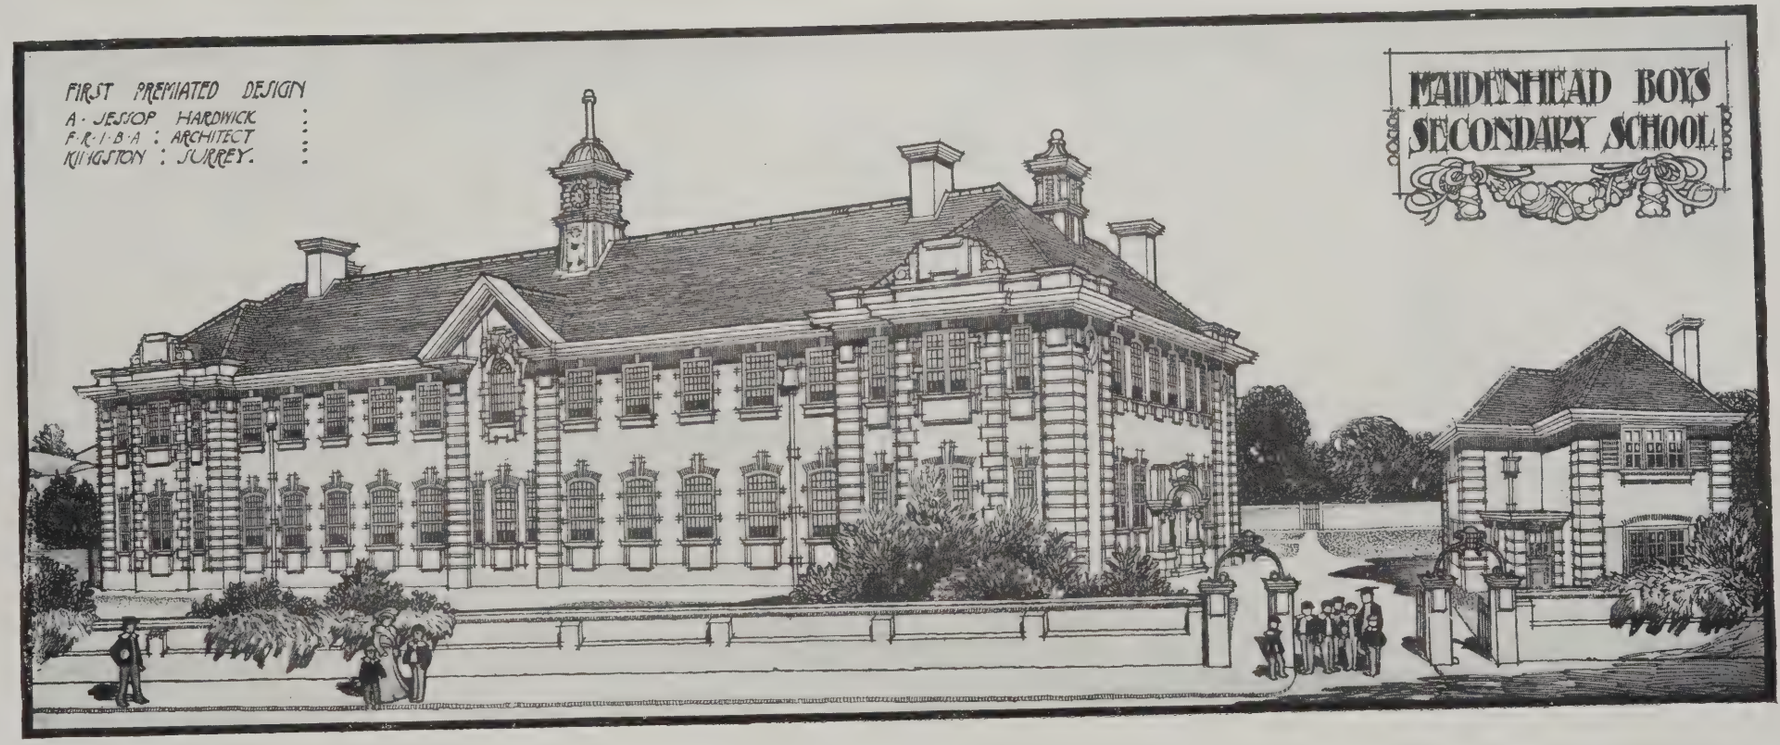
By the use of Stacey's hand-power winch, which we illustrate, material can be raised or lowered continuously to the scaffold. The apparatus can be made with reversible gearing for fast, medium, or slow supplies, and can be worked either by one or by two men, according to the load to be raised. Builders and others who are concerned in the raising and lowering of materials and goods, will be glad to

know that these winches have been approved by many members of the trade, by sewer contractors, merchants and others. In the illustration the apparatus is seen some 80ft. from the ground, on the roof of Bourne and Hollingsworth's extension in Berners Street, London. The winch here seen was fast-geared, and raised the whole of the concrete for the floors and the materials for the roof. When required for lowering material, as in sewer and well work, or lowering into barges, the winch is fitted with a brake. A building recently erected with the aid of these winches was the Round Tower of the Irish Village at the Franco-British Exhibition, which earned the makers a testimonal for facilitating the works.

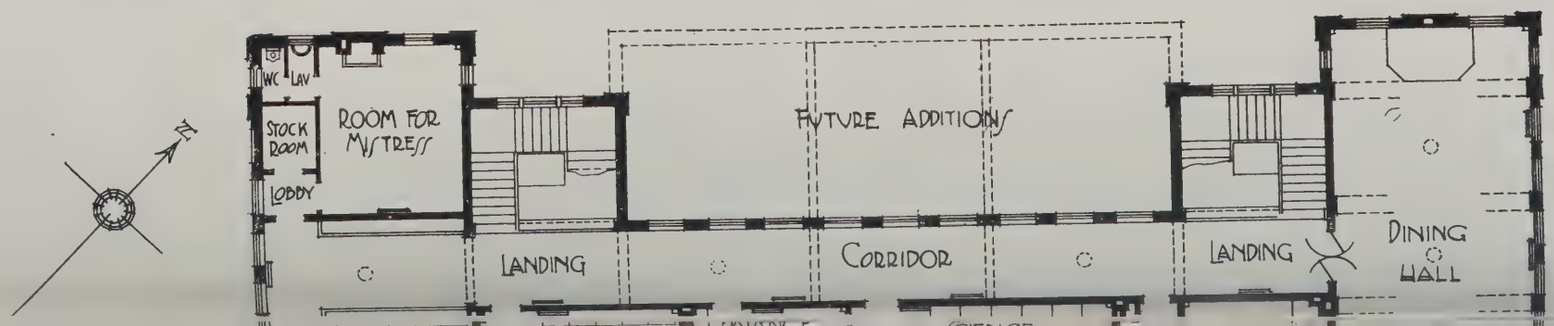
The winch is fitted with two fenced and sprocketed malleable iron wheels, and strong pitched chain (the breaking strain of which is two tons), and with a 30in. heavy cast-iron fly-wheel and cased handle, and can be supplied with or without a brake, as required. The wooden drum is 2ft. 6in. long, 10in. in diameter, and will take about 75ft. of 11in. rope, 94ft. of ¾in. rope, or 150ft. of ½in. flexible wire rope. The bearings of the driving spindle are made movable, and are adjusted with two set-screw bolts, in the iron-frame of the winch, for regulating the pitch chain.

Messrs. G. Stacey and Co., of 66, Lorrimore Road, Walworth, London, E.C., are the makers.

RUSSIA'S TIMBER TRADE.



A review of the timber trade of Russia for the first six months of this year shows a falling-off from last year. Russia does a timber business with all the chief countries of Europe and supplies even some countries, which are themselves rich in timber, such as Sweden and Norway. The following descriptions of timber all have a market in England, Germany, France, Belgium, and Holland—viz., deals, beams, sleepers, staves, poles, pit-props, wood for the production of cellulose, matches, and even firewood. Germany and England are the principal customers for Russian timber, and in 1907 they took quantities to the value of 38,400,000 roubles (£4,080,000) and 38,300,000 roubles (£4,069,000) respectively. The former takes principally beams and round wood. Deals form a relatively small proportion of her purchases, while deals, battens, and boards form the major portion of England's purchases, and amounted in 1907 to the value of 30,500,000 roubles (£3,241,000) out of the total noted above. Deals, etc., also form a large proportion of the exports to other countries; but these take a considerable quantity besides of squared beams and round wood. Business this year was very restricted with Germany, where the building trade was exceptionally dull. There were also considerable balances left over from last year. Prices this year as compared with last were lower by 15 to 20 per cent. Pine beams, which were worth 1.45 marks per cubic foot, are now sold at 1.20 marks, and scarcely find buyers. The situation is, of course, a serious one for the Russian timber merchants, for the timber has to be prepared a long time ahead. Business is better in the higher classes of goods used for joinery. Sleepers are in considerable demand, and prices are firm. The demand for oak sleepers has been particularly strong since the beginning of the year, and oak planks and staves likewise command good prices. Although there has been a larger export of timber to England than in the corresponding period of last year, the total value is in favour of 1907. The prices compare very unfavourably with those of 1907, and more so still with those of 1906. Pit-props are not included under this observation.



Our Plate.

This design for the Maidenhead Secondary School for Boys was awarded the first premium in open competition, in which 145 designs were submitted to the assessor, Mr. R. S. Wornum, F.R.I.B.A. The school is to be erected on a site of four acres, and provides for 150 places. The placing on the site formed an important point in the competition, owing to the position and irregularity of the land. The plan is arranged so that further additions could be easily and economically added to without disturbing the working of the school, or interfering with the general scheme of design. The walls are to be faced with local red bricks in two shades, and the roofs tiled with local red tiles. The centre feature of the main front will be in stone. The architect is Mr. A. Jessop Hardwick, F.R.I.B.A., of Kingston-on-Thames.

Recent Fires in Notable Country Houses.

Within the last few weeks a considerable number of serious fires have occurred in important private residences, notably in Lord Brassey's house at Normanhurst, Sussex. Without going into technical details, it may be useful to enumerate the following points of interest:—

The fire at Lord Brassey's mansion near Battle was noticed just after noon, when a little smoke was observed to be issuing from the upper portion of the house. An alarm was at once given, and there was no delay in telegraphing for brigades from the neighbouring towns. Two steam fire engines from Hastings, and manuals from Bexhill, Battle, and Normanhurst arrived, and 200 lads of the Church Lads' Brigade, who were camping in the vicinity, lent their aid. The fire burnt for about three hours, but, owing to the assistance available, the greater part of the valuable contents of the mansion were saved. There was a private fire brigade, as well as a special water-tank, in the house, the men being regularly drilled; but, unfortunately, something went wrong at the critical moment, otherwise the outbreak would have been more quickly subdued.

A second big country-house fire was that of Burley-on-the-Hill, one of the finest houses in Rutland, and it had been only recently renovated. The fire was first discovered at about one o'clock in the morning. It was a considerable time before assistance could arrive on the scene, and it was not until the Stamford brigade arrived with a steam engine that any determined attempt to subdue the flames could be made. In this case the damage was much more serious than at Normanhurst, the fine old building being burnt out, with the exception of one wing.

Cowfold Lodge, near Horsham, has also been completely burnt, and during the present year there has been a heavy roll of mansions destroyed by fire, many of them containing treasured antiquities and other articles of value.

Colonial Conflagrations.

The disaster which has overtaken British Columbia, and resulted in the destruction of a large number of villages, and even some small townships, by fire, is one that gives occasion for reflection as to the limited means at our disposal to prevent conflagrations of this type; and it is almost necessary to confess that beyond well-organised manual labour on entrenchments and earthworks, no means are available for preventing fires of this kind from destroying townships; and even entrenchments and earthworks frequently turn out to be labour wasted, if there has not been ample time available to do the work very thoroughly. It is, of course, needless to say that a long drought has much to do with the occurrence of such fires, and that a small spark may soon get well alight. Sparks, thrown down by careless persons, or scattered by passing locomotives, are not the only cause. It should be remembered that there is a fiery wind in Canada, just as there is in Switzerland, known as the "föhn," which blows with great violence. It is a very dry, dust-containing, one might almost say a gaseous wind, travelling at great speed, and its character is so well known that the Swiss laws compel inhabitants to put out all fires and lights if they receive warning of the approach of such a hurricane of wind. The "föhns," as known to those who take a technical interest in the subject, usually occur at intervals of about twelve years, and they are generally stated to have occurred round about the years '47, '59, '71, '83, '95, and '07, but whether this is mere coincidence or a regular sequence, is a matter of doubt. At all events, we are afraid that human limitations are such that, given the hurricane wind known as the "föhn," and that the "föhn" has once taken fire, little or nothing can be done to stop the destruction it initiates.

The Building Acts.

We observe, with considerable interest, that the London County Council, at its last meeting previous to the holidays, decided to take steps towards the consolidation and amendment of the London Building Acts. The matter has been before the Council for several years, but no decisive step has so far been taken, and we welcome the effort to obtain amended and simplified legislation. The London Building Act of 1894, which in many respects is nothing but a modification of the Building Act of 1851, is complex and antiquated to a degree; and to us it would seem that an entirely fresh code, framed to meet modern requirements, would be more beneficial to London than what at the most will be merely a tinkering of the 1851 regulations. Anyone who recollects the changes in construction in requirements since 1851 will realise how entirely hopeless it is to endeavour to modernise regulations that were framed to meet the necessities of those remote times. But if the Council cannot take the step of entirely reframing the Building Code of the metropolis—and we, of course, realise that it would be a difficult task—they would at least do well to overhaul thoroughly and bring up to date many of the present clauses, which are as ridiculous as they are antiquated. Most ridiculous of all are, we think, the clauses that require the external walls to be of a given thickness, no matter whether they carry weight or not, so that a mere screen has to be as heavily built as a wall that carries floors. Ridiculous to a degree is also a code which, whilst giving every possible attention to matters relating to external and party walls, seems entirely to overlook all question of divisional walls, internal columns, and the like, with the result that we find buildings of excellent exterior and most lamentable interior construction. Reinforced concrete, of course, was not with us in 1894, but steel-framed buildings were; and whilst the Parliament of the day did not properly consider steel-framed buildings, it is to be hoped that no similar mistake will be made next year with respect to steel-frame and reinforced concrete construction. It is obvious that properly protected steel-frame structures, in which all metalwork is, in the first place, correctly designed, and, in the second place, well protected by concrete, are useful economically, hygienically, and from the fire point of view, and the same can be said for reinforced concrete structures, with additional emphasis on the score of economy. It seems extraordinary that the building owners of the metropolis should not be able to avail themselves properly of the facilities offered by steel-framing and by reinforced concrete construction, and it is to be hoped that the new Building Act will allow these forms of construction to become freely available, of course with due regard to the precautions necessary to ensure fire resistance. What these precautions are, we need not detail at this point; but, speaking roughly, 2ins. of concrete of suitable aggregate should cover all metalwork, and it should be insisted that the Portland cement used should comply with the British Standard Specification. We shall not at the moment deal more fully with the points in the Building Act which we believe to require amendment from the fire point of view, but we would suggest at this stage that those in authority at Spring Gardens should invite suggestions from the various technical societies and bodies concerned, so that the views of these corporations could be made known at the earliest possible moment, and consequently much of the tedious argumentation between learned counsel in House of Commons committee-rooms would be avoided. It is this argumentation of learned counsel, and the compromises arrived at by the committees, that so often lead to complex and unworkable building codes. The clauses are perhaps drafted drastically, but probably they are drafted clearly; the amendments too often lead to confusion of purpose, and not necessarily to any less drastic reading.

THE LATE MR. JAMES SHEPPARD.

The Relations between Architects and Insurance Surveyors.

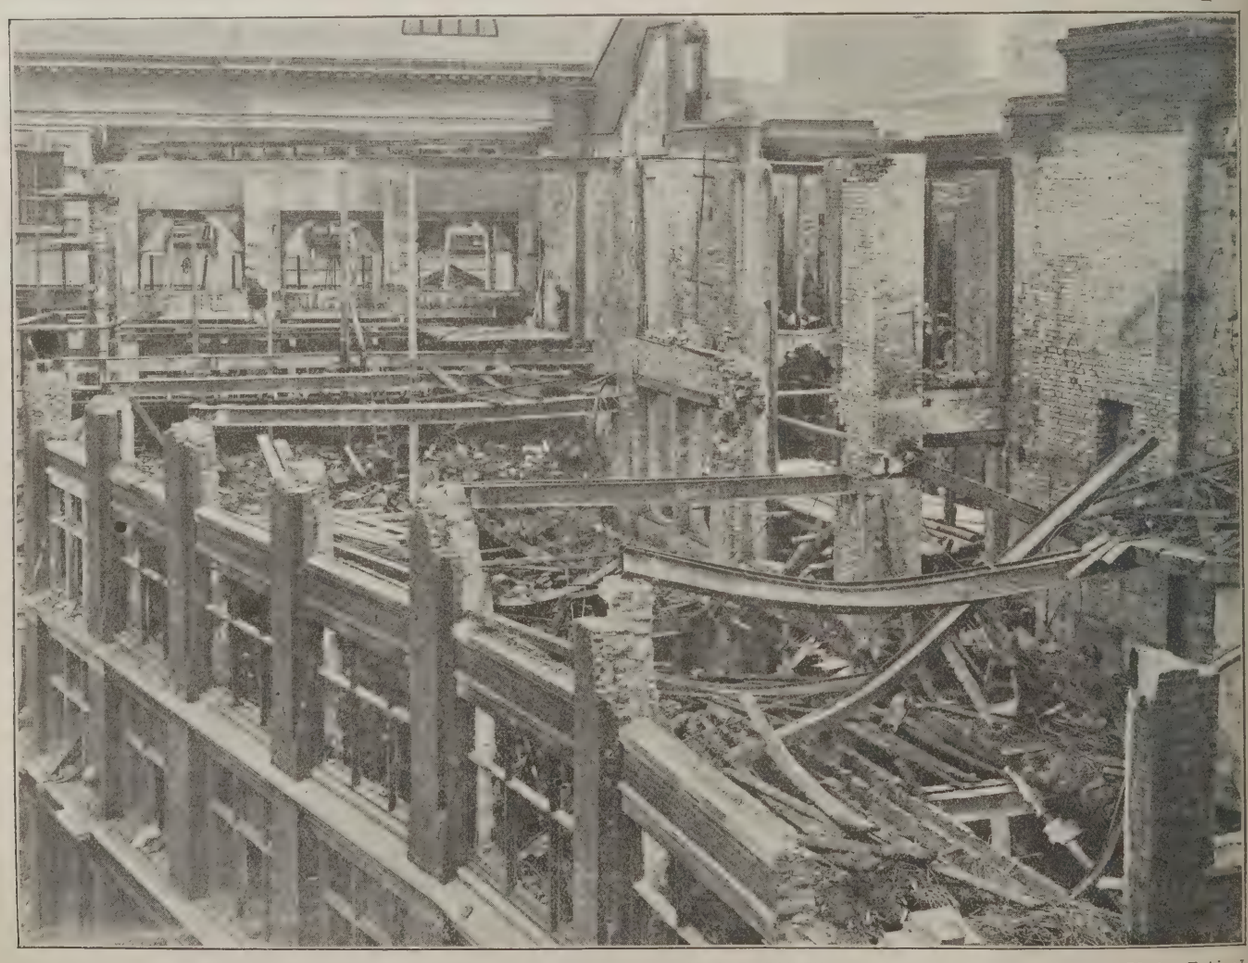
In our Obituary notices of August 12 we referred briefly to the death of Mr. James Sheppard, the chief surveyor to one of our leading insurance companies, whom we also had the pleasure of numbering among our occasional contributors; and we think we should take this opportunity to refer not only to Mr. Sheppard's lamented death, but to some of the aspects of insurance surveying as so admirably practised by him, this being a matter of some importance to architects and insurance surveyors generally.

Mr. James Sheppard stood for all that is best in the profession of insurance surveying, and whilst fulfilling his duty in a most successful manner in naming the rates of insurance to be granted on certain risks, and also most ably arriving at values in the case of loss by fire, he was always inclined to advise the insured as to how the premises could be

improved in order to reduce the insurance rate. Mr. Sheppard's view of profitable insurance was always in the direction of reducing the risk of fire, and of having the premises fully insured at the lowest rate obtainable on well-constructed and well-maintained premises rather than having buildings of a dangerous character under-insured at high rates.

His views also were generally most equitable as to what an improvement meant from a fire point of view; and if the building owner went to some expense in dividing up his risk, and generally improving the fire-resisting character of his premises, there was no one more ready than Mr. Sheppard to make an equitable reduction for the diminished risk.

The general tendency of an insurance surveyor is, as is well known, simply "to take risks as he finds them," to "name a rate," and to care little or nothing as to the general policy of fire-insurance profits, or for the improvement of premises with respect to fire risks. In a way, the majority of insurance surveyors are highly-trained appraisers, who, in accordance with given tariffs, by rule of thumb, or by conventional and arbitrary forms of practice, arrive at the rate upon which they think a building should be insured, and thereupon leave it to their managers to fix the rate according to their report. It is indeed the exception to find in their reports any recommendations as to how the premises could be improved and the fire risk reduced. Further, the attitude they generally take up as against the building owner, and more particularly as against the architect or engineer, is one that has long been a scandal. It is rare indeed to find an insurance surveyor helpful—although he is quite able to be most helpful—to the architect by suggesting to him in the early stages of the preparation of plans how matters would be looked upon from the fire point of view, and what a certain expenditure on improvements might mean in the way of reduced rating.



The orthodox policy of the insurance surveyor is simply to tell the architect, "Oh, *you* build the building, and when it is finished and installed *we* will quote a rate." On the other hand, the insurance surveyor of superior intelligence will go into the whole matter with the architect, and it will often be found that for a comparatively small additional expenditure a very much safer building, from the fire point of view, can be erected, and a reduced rate obtained from his insurance office.

We doubt whether, before we commenced publishing in these columns some of the more general fire-office rules, architects realised that such rules were even in existence. Were it not for the fact that the so-called tariffs were marked "confidential," we should also long ago have published the rules that govern specific hazards and risks; for we consider that an entirely unnecessary secrecy obtains among insurance men in respect to these "special risks."

In the case of Mr. Sheppard, his work in the direction of obtaining better fire risks for his company was, of course, greatly facilitated by his extraordinary knowledge of building construction; and we can truly say that there are few architects in large practice who had a more detailed knowledge of building matters. He was a veritable encyclopædia on all materials in their geological and chemical aspects, and on all methods of building practice, British, Continental, and American. The result was that, instead of being looked at askance by the members of the technical professions, as is the case with the majority of insurance surveyors, he was regarded not only as an equal professionally and as a friend, but as a leading authority on the subject under discussion; and his pronouncements on such questions as concrete and reinforced concrete, or on steel-frame buildings in particular, are to-day recognised as authoritative decisions, and they are quoted with equal respect at home, in the Colonies, and the United States.

No man was better fitted to occupy the position of chief arbiter of the country's building policy, from a general economic as well as from a fire point of view, than Mr. Sheppard, and his many friends (both architects and engineers) often regretted that he was not the official adviser of one of our great public departments rather than an officer of a private insurance company.

It would, indeed, be well for the in-

surance surveyors of Great Britain if they were to study somewhat closely the reasons for Mr. Sheppard's authoritative influence, popularity, and success; for there can be no doubt that, if his reasoning were more closely followed, not only would the standing of insurance surveyors be generally improved, but the insurance companies represented by them would be materially benefited; for co-operation between the insurance surveyor, the architect, and the engineer would lead to improved fire prevention; whilst, on the other hand, the antagonistic spirit that unfortunately prevails at the moment very often leads to an opposite result. How often do we hear an architect crowing over the fact that the insurance surveyor did not happen to "see" something which he wished to hide from him, and how often, also, do we hear of the insurance surveyor telling his colleagues how the architect, by some slight flaw, just missed getting a specific rate, and thus got into hot water with his client!

This, again, brings us to a point about which it would perhaps be well to speak quite clearly. We have often come across cases where the insurance surveyor has gone behind the back of the architect with the specific view of pointing out how, if Mr. Architect had done so-and-so, they would have been able to do so-and-so in the matter of the insurance rate; and we have often heard of cases where the architect and client have had a very serious disagreement over matters of this kind.

Such paltriness is, of course, indefensible, and can only be explained by the desire of some of the least suitable surveyors to air their importance before the building employer. But whatever the reason may be, such conduct does not tend to promote good feeling between the architect and the insurance surveyor.

It would lead us too far to enumerate the many writings of Mr. Sheppard, the last of which, we believe, were the papers he read before the London Insurance Institute and the Cardiff Insurance Institute. He was a prolific writer and contributor to the technical Press, and was rather addicted to controversy. To posterity, however, he will probably go down as one of the great leaders of research in the different forms of general building construction. There was no test, no enquiry, and no piece of research work in England with which he was not in some way or other connected during the last fifteen or twenty years. Most remarkable, of course, was his assiduity in all matters of fire tests, and in the many tests conducted by the British Fire Prevention Committee he served as a member of the sub-committees in charge of the majority of them, and in many cases as the directing member who undertook the hard work of keeping the records and drafting the reports.

Mr. Sheppard was a member of the executive of the British Fire Prevention Committee for some ten years, and was probably one of the most regular attendants at its meetings. He acted as chairman of the International Fire Library, which position entailed upon him a considerable amount of work; and latterly he was a member of the Special Commission on Concrete Aggregates. It was very typical of Mr. Sheppard's interest in matters of construction that he was one of the founders of the recently-formed Concrete Institute.

THE FIRE IN OLD BAILEY.

The fire which recently occurred in Old Bailey has the peculiarity of being, to a certain degree, a repetition of a serious one that occurred some fifteen or sixteen years back on the same site. The more recent fire was again a very dangerous one, having special regard to the locality and the character of the structures involved, which comprised Nos. 49, 50, and 50a, Old Bailey. The fire, too, had apparently obtained a very substantial start over the Sunday and August Bank Holiday, for the moment it was noticed it was already of an extent that made it extremely dangerous. Fortunately, however, the fire brigade was able to concentrate with that rapidity which has of late distinguished them to quite a remarkable degree, and the result was that what might have been a serious conflagration was limited to the buildings named.

What struck us in connection with this fire is the fact that a structure so recently built should have been of such unsatisfactory construction from a fire point of view. Unprotected steelwork, unprotected columns in particular, were features that might have been expected in a building fifty years old, but assuredly not in a structure erected at a time when architects and engineers had already commenced to realise the necessity of protecting their metal-work; and here we have a further instance of the urgent necessity for amending the London Building Act, so as to compel owners to give structures of this kind proper protection in the interior, over which there is little or no control at the present time.

The usual fire inquest, which is perhaps being convened in the City of London with inconvenient frequency of late, was held, although the fire had no elements of mystery or technical value. As usual, nothing of importance resulted from the inquest, except the academical suggestion from the jury advising the general adoption of automatic fire alarms, a recommendation which we are sure the patentees of various automatic fire alarms on the market will fully appreciate. We, of course, fully concur that automatic fire alarms, when reliable and when well maintained, are to be strongly recommended for certain classes of premises, but we cannot concur in the generalities of this eminently lay jury. For special risks we would go so far as to say that an automatic fire-alarm system should be compulsory, always provided that the maintenance of the appliances is carefully controlled; but we certainly do not think that such an installation is absolutely necessary in the average city office, or in structures of

BURLEY-ON-THE-HILL: INTERIOR AFTER THE FIRE.

an ordinary type in the metropolis, and we believe the jury's recommendation would have had much greater weight if they had limited their advice to stating that "printers' risks," or "stationers' risks," would be reduced by the adoption of efficiently-maintained and properly controlled automatic fire alarms. Mere vague generalising is but seldom translated into definite action.

One consideration that has lately very much struck us in connection with the fire inquests in the City, has also an obvious bearing on fire inquests held in other parts of the country. We hold that the City is fortunate in having such an able coroner as Dr. Waldo, who takes a keen interest in the fire question; but we think that, no matter how able the lay coroner may happen to be, he should have the assistance of technical advisers. As a precedent, we may point to the example of the Admiralty Courts, where naval officers, or officers of the mercantile marine, are available for the benefit of the Court.

Coroners holding inquests on fires should certainly receive such expert assistance as they may require from a fire brigade officer, and from a building surveyor conversant with the subject of fire prevention; and it might be desirable for the coroner to hold a consultation with these assessors with a view to ascertaining whether or not a public inquest was really necessary. Inquests would then be limited to really important issues, and would be in much less danger of becoming a matter of mere perfunctory routine. For, to put it quite plainly, these too frequent inquests, when there is really nothing of importance to inquire about, are likely to become a nuisance to all concerned. Fire inquests are wanted where there is a possibility of incendiarism, where life has been at risk, and where technical problems of importance demand inquiry. But to hold inquests in respect to fires of quite normal and featureless character is mere waste of time and energy.

SOME AMERICAN FIRE TESTS.

In our issue of July 1st we presented some interesting photographs of official fire tests undertaken in the United States of America with various building materials, but we were unable to present any official commentary on the subject, as the detailed report had not then been issued. On further enquiry we hear that there will be some delay in the issue of this detailed report, but that in the meantime a commentary has found its way into the American press, which gives some idea of the objects in view when these tests were undertaken, and also the personal view of Mr. Smith, a well-known authority in America on questions of fire prevention, as to the result of the tests so far as they have gone.

Perhaps we should add that the series is not yet complete, and is being repeated; but, nevertheless, we think that the American version of these tests should be of interest to our readers, especially if they refer back to page 15 of our issue of July 1st. The American semi-official memorandum, which we have seen, reads as follows:—

"The recent conflagration in the United States, with their terrible loss of life and property, have added much significance to the fire tests of building materials that have been conducted recently by the United States Geological Survey on behalf of the Government.

"The Federal Government, owner of buildings valued at more than half-a-billion dollars, and spending twenty million dollars every year for new structures throughout the country, conducted these tests in order that its architects and engineers may have definite information concerning the fire-resisting qualities of the different materials of construction, to the end that the Government's buildings may be properly safeguarded from within and without.

"The Government engineers have long contended that, with present methods of construction, a conflagration, resulting in the destruction of millions of dollars' worth of property and the sacrifice of human life is possible in every city of any size in the country. Their position has been proved in a tragic manner by the Baltimore fire, the fire following the earthquake in San Francisco, and that in Chelsea.

"It is the belief of the engineers that these great fires are unnecessary and can be prevented by the erection of proper fireproof buildings. The Government does not insure its buildings against loss by fire, but bends its energies towards making the structures fireproof. A small fraction of what would be paid to insurance companies in premiums is being spent in finding out the materials that are best adapted to resist fire.

"The first of a series of elaborate tests have just been completed by the Structural Materials Laboratories of the Geological Survey, under the direction of Richard L. Humphrey, engineer-in-charge. The tests were conducted at the Fire Underwriters' Laboratories in Chicago, and were made possible by the co-operation of the National Board of Fire Underwriters and the National Fire Protection Association. Thirty panels of various building

materials, including concrete building blocks, common, hydraulic-pressed, and sand-lime brick; concrete of gravel, cinder, limestone, and granite; glazed building and partition terra-cotta tile; sandstone, granite and marble building stone, were tested. The materials were subjected to the direct application of heat for two hours, and were then immediately quenched with water. An effort was made to obtain a maximum temperature of 1,700 degrees Fahr. within half-an-hour after starting the tests, and to maintain this temperature as nearly as possible constant through the succeeding half-hours.

"The building materials were placed in a sliding panel which, when arranged for the fire tests, formed one side of the furnace. In the furnace, gas-flames were forced by a blast of air against one side of the panel. After two hours, the panel was brought from the furnace, and the water turned on from a hose with a pressure of 50-lbs. to the square inch.

"The conditions under which these tests were made were unusually severe, and as none of the materials passed perfectly it proved a good test for comparative purposes. The temperatures used would hardly be reached in an ordinary fire, but might be in a conflagration.

"'While these tests are not conclusive, being but the beginning of a general line of investigation,' said Director Smith, of the Geological Survey, 'they bring out a number of important facts. The brick panels probably withstood the tests better than any other materials. There were two lots of common brick tested—one was an unused, recently manufactured brick, and the other a brick that had been in an engine foundation for some years. The latter seemed to withstand the test the better. Fifty per cent. of the new bricks were split, while 60 to 70 per cent. of the old bricks were not damaged. The bricks at the back of the panel were entirely unaffected. The hydraulic-pressed brick stood the test better than any other material. No damage was apparent whatever after the firing and before the water was applied; and although a number of the bricks cracked, 70 per cent. of them were found to be sound after quenching. There was apparently little difference in the strength of the bricks before and after firing. The natural building stones behaved the worst of all the material tested. The almost complete destruction of these stones precludes any comparison between them. The sandstone panel entirely collapsed soon after the test was started.

"The testing engineers report that it was difficult to determine whether the concrete made of limestone, granite, gravel, or cinders sustained the least damage. Their surfaces were all rather badly pitted by the fire and washed away by the stream of water. The test was unfair to cinder concrete, as the sample of cinder was very poor, containing a large percentage of unburned coal which ignited and left the surface of the concrete badly pitted. The granite concrete probably behaved the best. The damage in no case extended very far into the concrete—probably not more than 1½ins. The evidence shows that even at this depth the temperature was comparatively low. The rapid heating of the face of the concrete while the back remained cool caused the concrete to crack vertically for some distance back from the face. The cracking of the concrete can be avoided, it is believed, by using metal reinforcement, which would distribute the effect of the expansion.

"The tests also brought out clearly the low rate at which the heat travels through concrete. This is one of the desirable qualities in materials intended for fire-proofing purposes.

"Linen tags which were placed in the hollow concrete blocks when they were moulded were found to be undamaged after the fire test. In many instances the hollow blocks split after being subjected to the fire and water test. It was noticeable that the richer the mortars used in these blocks the less they were affected by the test. The mortars mixed with the greatest percentage of water gave the best results. The wetter, richer mixtures in these tests stood out apparently undamaged in contrast with the damaged faces of the leaner dryer blocks. It is apparent that one of the causes of weakness in the hollow cement building blocks is in the weakness of the concrete due to a too dry and thin mixture, which, coupled with the thinness of the webs—the thin pieces connecting the walls of the blocks to give strength—provides insufficient strength to resist the rapid expansion of the face of the block under test. By making the webs thicker they can be made to stand the fire test satisfactorily."

FIRE AT THE ROYAL OPERA-HOUSE, BERLIN.

The cross shows the point at which the fire originated.

THE BERLIN OPERA HOUSE FIRE.

We have previously referred to this fire, which was made the subject of many sensational paragraphs in the daily press, but which, as a matter of fact, was a very small matter, as will be seen from the accompanying photographic illustration, which indicates the full extent of the fire. The cross marked on the illustration shows the position at which the fire broke out; and in these days, when the question of the fire resistance of materials is being so largely discussed, it is interesting to observe that, although the fire spread along the timbering, the result has been only a superficial charring, which can be plainly seen from the illustration.

More extraordinary, however, than any question relating to the actual fire is the fact that a roof of this description should have been allowed to exist over an opera house which, we are told, has had the special attention of the public authorities at Berlin, and even the personal interest of the German Emperor, who subsidises the royal opera at Berlin. In the case of a similar building situated in London, the L.C.C. would long since have directed that the soffit of the timbering and boarding should be protected in some manner by a non-combustible material, so that the woodwork would not immediately flame. Probably the Council would have suggested protection by asbestos slabs or by plastering; but, at any rate, some effort would have been made to give so much woodwork a protective covering of some sort.

It is, of course, impossible, with an old building, to require entire reconstruction, or even to require alterations of an all too considerable extent; but the least that can be done is to protect highly inflammable surfaces, and this, we believe, has now been generally achieved in all the older London theatres: and even where such protective measures have not been required, the spaces are no longer allowed to be used for storage purposes, and have generally been closed up by doors. As a matter of fact, one would say that the Berlin opera house requires to be entirely rebuilt; but this might also be said with equal truth of many opera houses of more than 100 years' standing. Our whole ideas on opera-house and theatre construction are so different from what they were at the beginning of the last century. The photographic view we present, by-the-bye, is one of somewhat unique interest, as it is but seldom that a detailed photograph of this description is available to the public.

PARIS THEATRE REGULATIONS.

New theatre regulations in Paris, which have just been issued by M. Lepine, the Prefect of Police, include provisions for the abundant ventilation of the premises between performances, including the dressing-rooms, and elaborate precautions to be taken against fire, with rules as to the width between rows of seats, etc.; but it does not appear from the published summary that the practice of allowing people to sit in the gangways is to be discontinued. If it appears that the new fire regulations are in any way noteworthy, we shall give due attention to them in a future issue.

FIRES IN COUNTRY HOUSES.

The fact that recently several well-known country houses have been the scenes of serious fires has led to a considerable discussion on the subject of protection from fire in buildings of this description. There cannot be the least doubt that the risk of fires in country houses is considerable, and if the large number of small fires that occur in such buildings were known—that is, fires that are put out by the home staff, and, no notable member of the House of Lords or the House of Commons having assisted, are not advertised in the daily press—it would certainly seem that greater care should be taken to obviate such ever-present dangers. The large majority of country houses of the type we have in mind were erected long before the time when the question of fire protection was seriously considered; and the most elementary rules regarding building construction as practised to-day often entirely neglected. But, entirely apart from the structural hazard of the building as originally erected, there has been the additional risk of numerous alterations, reconstructions, and redecorations frequently undertaken without skilled supervision, and too often leading to the accentuation of the dangers we have in mind. We have seen cracked flues covered with valuable tapestry fixed to a canvas backing; we know of boiler pipes hidden behind upholstery in which the wool stuffing was of a somewhat oily nature; in fact, we have come across every possible form of negligence in the work of alteration and redecoration in places of this type. Next we have the fact that the methods of illumination have been changed from the original lamps or candles to, say, gas in the first instance, and latterly to electric light; and in many instances the electric installation in particular has been carried out by unskilled hands. It is true that occasionally a first-class electrical engineer is commissioned to prepare the lighting scheme; but as a rule the work is put into the hands of a contractor without supervision, and too frequently the contractor is careless of the fire risk. The very most he does is to pass the fire office rules, and there are even contractors who spare no effort to throw dust in the eyes of the insurance surveyor. Apart altogether from original structural errors, the errors of alteration and redecoration, the errors of illumination, all the possible additional risks to be met with in a factory or warehouse, hazard can occasionally be observed in a country house. The kitchen is sometimes turned into a veritable bakehouse, and, as a matter of fact, baking appliances are installed which do not receive proper supervision. The so-called lamp-room becomes a veritable oil store; the hot-water system becomes a specific danger, owing to special heating being required at high temperatures after a long period of disuse; the hot-water service is strained to an extraordinary degree, when the house is in use, by large demands for baths on the occasion of shooting parties. Smoking seems to be carried on all over the house now-a-days, and the ash-tray and match are just as common in the lady's boudoir as they are in the servants' boot-house. Altogether, an old country house conducted on up-to-date lines has about as many fire hazards as a badly conducted factory. In the circumstances, indeed, it is remarkable that the insurance companies, which do not fail to wring every possible penny out of an industrial fire hazard, have generally put such a low rate of insurance on the country house, and to our knowledge some of the worst structures of this kind stand to-day on what is known as the "half-crown rate." The country house would not be such a matter of importance as a fire risk were it not also that in many cases the building is an archæological monument of considerable national value, and that quite apart from any question of loss to the owner the destruction of an historic country house is a national loss of no small moment. It should thus be the endeavour of every architect in touch with old country houses to use his influence to obtain a remedy for some of these fire hazards. As a matter of fact, however, it is difficult to obtain these remedies, for many reasons, not the least being the absence of skilled advice. The architect, with few exceptions, does not take that interest in fire protection that is desirable. He is apt to lean too heavily upon the so-called fire engineer or engine-maker, whose sole interest is rather to instal hydrants and hand pumps or sprinklers, than to go to the root of the matter, which is that of fire prevention and the division of fire risks.

HEIGHT OF BUILDINGS IN RELATION TO FIRE RISKS.

One of the most difficult of the problems that the New York Building Code Revision Commission are trying to solve is that of limiting the height of buildings. It is true that in London we are not confronted with the same difficulty. Nevertheless, the subject presents many points of interest for those who aim at a broad survey of the whole subject of fire risks. The position of the New York underwriters in the matter is conceded by progressive architects and business men to be reasonable, but the question as to what the limit of height shall be seems almost unanswerable, for various reasons arising from personal interests.

Mr. Ernest Flagg, the architect of the Singer Building, offered a solution that was novel and also worthy of consideration. "Evidently the old plan of limiting the height of buildings to secure light and air will not avail in New York to-day," he said, "for we will never consent to place that limit low enough to do any good. We must seek a new method, and I believe the one I suggest will do the work.

"To meet present conditions we must place our buildings on end, so to speak, like teeth on a harrow, and separate them sufficiently to let sunlight and air in between. In other words, build a city of towers. I advocate the following plan: (1) No limitation at all on the area which can be covered to a height equal to once and a half the width of the street, but in no case to a greater height than one hundred feet. For if the limit of height is not too great, there is no necessity to limit the area covered. People always have, and of necessity will leave, enough land vacant to light the interior in all buildings except those for the poor. It is only when buildings are abnormally high that the courts become too small.

"(2) No limitation at all to the additional height to which buildings or parts of buildings can be carried covering an area equal to one-quarter of the area of the plot on which they are built. For if only one-quarter of the land is built on to a great height, it makes no great difference what the height maybe. There will be plenty of space vacant to let in sufficient light. Practical considerations of economy and engineering will afford all the curb necessary.

"(3) A restriction against building higher than the first-mentioned limit within a distance of the building line equal to the combined width of the sidewalk and area of the street on which the building faces. The high part of the building should be kept back from the building line, both to preserve the uniformity of height for the facades, and to insure sufficient light for the street.

"(4) A requirement that all facades which are carried above the first mentioned limit of height must be treated architecturally. For as the high part or tower would be seen from all sides, all sides of it should be attractive to look at.

"(5) A provision that the right to build above the first mentioned limit of height shall be negotiable in favour of adjoining land. This provision is made because some people may not want to build above the height established for the facades; others may want to build high on more than 25 per cent. of their land; therefore, one may wish to sell, and another may wish to buy, this right. Land having parted with its right to go high in favour of adjoining land would, of course, be always restricted to the height established for the street facades. As matters stand at present, an owner may find his land built up on three sides to any height, his light pre-empted, and his property rendered practically useless Were the proposed plan in operation, his rights would be protected. Adjoining owners could only build high on one-quarter of their property, and do him comparatively little harm, unless they bought the rights of adjoining land, in which case the owner selling would receive compensation for the damage done him.

"(6) A requirement that no wood whatever, either for the building or its equipment, should be used above the first mentioned limit of height.

"Danger from fire is one great objection to high buildings. If a district is closely built up with high buildings, fire in the upper part of one may spread to others and create a general conflagration far beyond the reach of the fire department. If only one-quarter of the land could be covered by high buildings, they would be sufficiently separated to prevent such a catastrophe, even if they were not fireproof. Few people realise to what a great extent wood is used in most of our so-called fireproof buildings. Double floors, sleepers, doorbucks, window frames, doors, sash and trim, to say nothing of furniture, etc., require an immense quantity. No wonder they burn. It is perfectly practicable to build without wood, and certainly no wood should be used in any part of a building which is above the convenient reach of the fire department.

"The plan I propose is simple; it would work automatically. It would, I believe, rid us of all the evils with which we are threatened by the present unrestricted multiplication of high buildings.

"The Singer Building is not a complete illustration of what I propose, because the low part of that building is far higher than the limit of height here proposed, but in other respects it may serve as a sample. The high part occupies even less than one-quarter of the area of the plot; it interferes with no adjoining property; it depends on its own land for its light; it presents an ornamented facade to every point of view; it stands well back from the street line so as not to mar the facade, and no wood whatever has been used in its construction. It is what all tall buildings ought to be—really fireproof."

Photo: Topical.

FIRE AT A PIANO FACTORY, KING'S PLACE, CAMDEN TOWN.

Some 400 Pianos were destroyed with the building, which, as may be seen, had no fire-resisting floors.

A FIRE EXTINGUISHER FATALITY.

At the Paddington Coroner's Court, on August 19th, Mr. W. Schroder held an inquest on the body of William Bowen, aged 46, of Dartmoor Street, Notting Hill, caretaker at the Elysée Art Galleries, Queen's Road, Bayswater, whose death was caused by the explosion of a patent fire-extinguisher while it was being tested. Mr. F. G. Oliveri, the proprietor of the galleries, said that on the preceding Saturday he directed Bowen to light a fire, so that he could test the extinguisher. The witness played on the flames for about half a minute. The extinguisher had got practically exhausted, when Bowen took it from him, and it exploded almost immediately, throwing the man violently to the ground. He died in a few minutes. The witness bought the extinguisher from the London agents of the Continental Chemical Fire Extinguishing Company, a firm which no longer existed. A doctor said that Bowen was severely injured, his collar-bone, chest bone, and wrist bones being fractured, and his windpipe mangled, and he had internal injuries also. Death was due to shock following these injuries. The manager of a firm who supply recharges for fire extinguishers said that, according to the circulars of the manufacturers of this extinguisher, it had been made to withstand a pressure of 144lb. to the square inch, but in his opinion nothing less than 250lb. was safe. The inspector of explosives for the London County Council said the extinguisher was of extremely frail construction. The wire gauze covering the entrance to the tube was coated with rust, which greatly increased the pressure, and caused the explosion. The jury returned a verdict of "Accidental death," and added a condemnation of the extinguisher, but the coroner refused to accept the rider in the absence of the parties concerned.

GREAT FIRE IN CONSTANTINOPLE.

A Reuter's cablegram from Constantinople, dated August 23rd, announced that there was then raging a great fire in the Stambul quarter of Constantinople. It had then been burning for six hours, being fanned by a strong wind. It was estimated that more than 1,500 houses and shops had been burned. The wind was then subsiding, but, in spite of the efforts of the fire brigades, the conflagration was still raging. In this lamentable fire, many interesting examples of Moslem architecture must have perished. Possibly the rebuilding may see the introduction of modern fire-resisting methods, and of Western ideas generally. Constantinople's great fire, disastrous though it may appear for the moment, may, in accordance with many precedents, result in great ultimate gains of sanitation and safety.

TIMBER FAMINE AND FIRE RESISTANCE.

"The Coming Timber Famine" has, during the past week or so, formed the subject of a good deal of correspondence in the "Times" and elsewhere, and on August 18th the "Times" published a leading article headed "The World's Supply of Timber." The discussion has been for the most part rather pointless and unilluminating. The pessimism that pervades it is largely discounted by the observation made by a Hampstead correspondent. He points out, with reference to Mr. Angus Cameron's prophecy of a timber famine that is to become acute twenty-five or thirty years hence, that the use of wood in up-to-date building is decreasing rapidly. "In the modern good-class building, fire-resisting and more lasting materials have taken its place in every way, and with the exception of doors and floor-finishings (for the latter there are many successful substitutes on the market) the wood employed is practically nil." This is a good point, and it gains force from the changed attitude of the London County Council with regard to improved methods of construction, these methods, of course, having direct reference to fire-resistance. But, so far as we have seen, nobody seems, in the course of the discussion, to have taken note of the enormous consumption of timber involved in its use for railway sleepers. Until this extravagant practice is stopped by the adoption of some form that reinforced concrete experts may be able to suggest, reafforestation, with its requirement of about forty years for maturity, does not appear to have much chance of staving off the threatened dearth. If, however, fire-resisting construction continues to develop on the present lines, the prospect of famine is much more gloomy for the timber merchant than for the builder, who, indeed, does not seem to be greatly scared, nor even mildly excited by the prediction of a shortage of wood that may or may not be experienced some thirty years hence. Moreover, what is for the moment the chief anxiety of the timber merchant is the falling-off in the demand. On the whole, the discussion seems to be rather ill-timed, but is, perhaps, a good enough topic for the silly season.

Views and Reviews.

Decoration and Diffidence.

The author of this very useful manual need not have been so meekly apologetic to architects for daring to provide them with trustworthy information on a subject on which they could hardly pretend to possess minutely accurate technical knowledge. "He ventures to hope that while architects rightly object very strongly to be in any way dictated to by a tradesman as to how work shall be done after the contract is signed and while the work is in progress, they will not take exception to an earnest effort being made by a practical man to throw light on a subject which is, at the best, but imperfectly understood, and is withal exceedingly intricate and comprehensive." Apparently, the author does not see that, in making this too deferential approach, he comes near to suggesting that the average architect is a blend of Sir Oracle and Caius Martius Coriolanus—too loftily contemptuous to listen to meaner men, and entirely disdainful of the old tag, *Experto crede*. Architects, however, will be glad to have this book, which, so far as we can see, affords excellent guidance as to the choice of the methods and materials of decorators' work.

Specifications for Decorators' Work. A Guide to Architects, Engineers, Property Owners, Estate Agents, House Painters, and others. By Fredk. Scott-Mitchell, Lecturer on Decoration to the City and Guilds of London Institute, etc. London: The Trade Papers Publishing Co., Ltd.

Brickwork and Masonry.

Some time ago the authors of "Mitchell's Building Construction" re-issued the chapters from that work dealing with most of the aspects of brickwork and masonry. They interpreted the title of the volume in a very wide sense, presumably because students of brickwork and masonry would be interested in allied subjects, such as drain-laying, excavation, etc., but we do not consider it quite wise to have branched out into so many side issues, for, surely, if the student of brickwork and masonry buys a book on his own particular subject, he may expect it to be confined to that subject. If he wished to obtain information on allied subjects of building construction he would, in our view, consult a book on building construction. We cannot quite understand either why brickwork and masonry should have been associated. We know the former is a kind of masonry, and, in fact, that in the United States both subjects are called by the general term "Masonry," but they are really things apart, and we certainly do not expect a bricklayer to be a mason, or vice versa. A book dealing with these special branches of building construction

must appeal generally to craftsmen, and therefore the mason does not want to have his text-book padded with information on brickwork, nor the bricklayer his book largely concerned with masonry. There is need for a good deal of extended information on each subject, but the authors have in great part reprinted the matter from their book on "Building Construction." Thus it is that while in the latter the information was very properly condensed, for a book dealing with the subject in detail the information which the authors provide is far too scanty. In short, we consider they have not taken sufficient trouble in the compilation of this volume. In a book dealing with brickwork one might expect considerable information on bricks and brickmaking. Ornamental brickwork might also be included, and terra-cotta is a subject that comes within the bricklayer's scope. In the same way, in a book on masonry there is a call for an extended treatment of the subject of stones and quarrying. The craftsmanship has been sadly neglected in this volume. We note that a chapter has been included on reinforced concrete construction in which the report of the R.I.B.A. Committee has been incorporated. We really do not see how this can be legitimately called either brickwork or masonry; it is quite specialist work. Furthermore, the authors have not dealt with the subject at all satisfactorily. There is, of course, much useful information in the book on various subjects, and we are sorry to be unable to accord it less qualified praise.

"Brickwork and Masonry." By Charles F. Mitchell, assisted by George A. Mitchell. Second edition. London: B. T. Batsford, 94, High Holborn, W.C. Price 7s. 6d. nett.

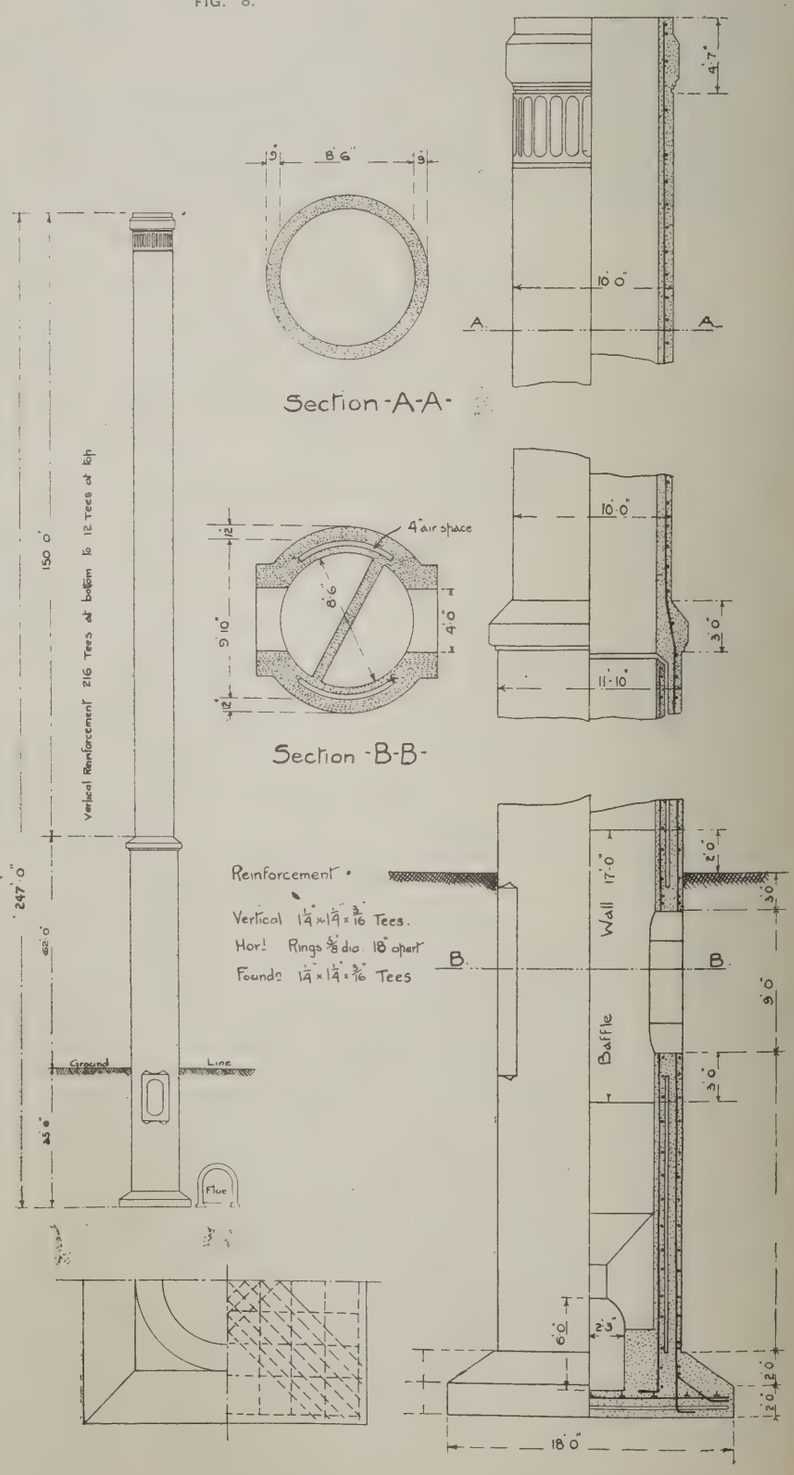
Cementing and Plastering.

The author of the "Cement Workers' and Plasterers' Edition of 'The Building Mechanics' Ready Reference," states that it is intended for the use of the "ordinary mechanic or worker in cement and concrete." If he is justified of his confidence in the belief that the mechanics of his country are sufficiently numerous and sufficiently enthusiastic to create a satisfactory demand for this manual, then the "ordinary mechanic or worker in cement" of America must be of a very different type from his congener of our own country. Not that our man is less intelligent, but that he has probably less initiative than the American, and, being accustomed to implicit obedience to orders, is by no means studious of what is rather loosely termed the "literature" of the subject. Much of the information contained in the book is reduced to tabular form; and in this country such a comprehensive "ready reference" book will probably be found serviceable by those who have the control or superintendence of cementing and plastering work, and possibly by here and there a "mechanic" ambitious of promotion.

The Building Mechanics' Ready Reference. Cement Workers' and Plasterers' Edition. By H. G. Richey, Superintendent of Construction, U.S. Public Buildings; 16mo, vi. by 458 pages, 193 figures. Morocco, 6s. 6d. net. New York: John Wiley and Sons. London: Chapman and Hall, Ltd.

Homeland Handbooks.

We have received two more of the excellent series of handbooks issued by the Homeland Association, of 15, Bedford Street, Strand. These are the fourth edition of the handbook on "Minehead, Porlock, and Dunster," vol. 18 of the series, and "Dover and Its Surroundings," a first issue of vol. 71 of the series.



MODERN PRACTICE IN TALL CHIMNEY CONSTRUCTION.

By Hector St. G. Robinson.

(Continued from page 112, No. 705, and concluded.)

An interesting example of this class of chimney is shown in Fig. 8. This chimney was built by the Weber Company for the Associated Portland Cement Manufacturers, Ltd., and is situated at their Bevans Works at Northfleet. This is a typical example of the class of chimney built by the Weber Company. The total height of the chimney is 247 ft., 35ft. of which is below ground level, the inside diameter being 8ft. 3ins. throughout. The outside shell up to the offset is 12ins. thick, the inside lining 4ins. thick, with a ventilated air space of 4ins. between the lining and shell; the outer diameter of this portion being 11ft. 10ins. above the offset, the single shell having a uniform thickness of 9ins. The vertical reinforcement consists of 1½in. by 1¼in. by 3-16in. Tee-bars, the horizontal reinforcement being round rods ⅝in. diameter spaced at 18in. centres. There are 216 vertical bars in the outside shell, commencing at the base and running up for a distance of 50ft., from which point they

FIG. 8.

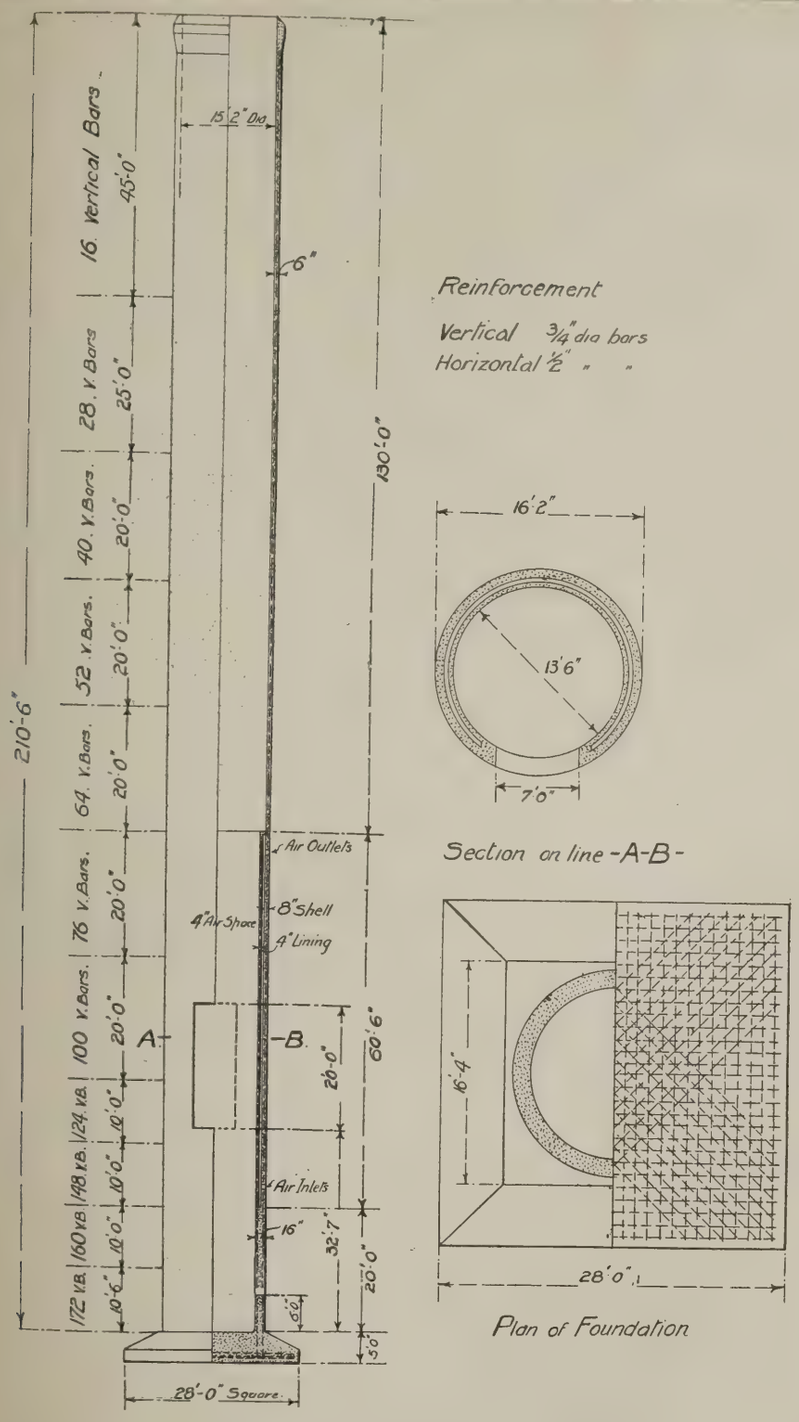


FIG. 9.

are reduced in number every 10ft., until in the last 67ft. from the top only 12 bars are used. In chimneys of this type great care should be exercised in constructing the battered offset. Owing to complication of the form-work at this point, considerable delay is frequently caused, with the result that planes of separation and soft spots in the concrete are likely to occur. At this point also the outside shell first receives the hot gases, the thermal stresses being considerable. It can be claimed for this type, however, that the flue is of uniform diameter throughout, and the area of chimney exposed to the wind is a minimum. A chimney with the outside shell of uniform diameter is illustrated in detail in Fig. 9. This example was designed and executed by the American branch of the Alphons Custodis Chimney Construction Company for the Edison Electric Illuminating Company in Brooklyn, N.Y. The total height above the ground is 210ft. 6ins., the diameter of flue being 13ft. 6ins. in the lined portion and 15ft. 2ins. in the unlined portion. Owing to the boiler flue entering the chimney fairly high up, the first 20ft. of the chimney are in the form of a solid shell 1ft. 4ins. thick, from which point the lining commences. The shell in the lined portion is 8ins. thick, both the lining and the air space being 4ins., the top portion of the shell being 6ins. thick.

The vertical reinforcement in this case consists of ¾in. diameter round steel bars, the spacing being shown on the illustration, the horizontal rings being ½in. diameter round steel bars. This type of chimney avoids the complication of the battered offset, and the slight increase in the diameter of the flue is too small to have any appreciable effect on the draught. The area presented to the wind is slightly increased, but the moment of resistance is also increased, due to increased diameter.

Reinforced Concrete and Tile Chimneys. Reinforced concrete and tile chimneys are of a type that distinguish themselves from others of the reinforced concrete class. They are known in America as the Weiderholt type. A typical example is shown in Fig. 10. The construction employs burnt clay tiles of a peculiar shape, the tile blocks being laid in the wall with vertical joints broken or staggered as in ordinary brickwork, and serve both as centering or framework for the concrete, and as a hard and durable facing material. The space between the inner and outer plates of the tile contains the reinforcing steel and the concrete. This portion, of course, is like the shell of an ordinary reinforced concrete chimney, except that it is intersected by the lines of vertical webs, and can be designed in a similar manner. As there is usually no inner concrete lining to this class of chimney, it is customary to protect the shell for some height with asbestos. A firebrick lining could, however, be adopted if required. In the example given the vertical bars are of square twisted steel, the horizontal bars being of the "Indented" type. Anchor rods project up 4ft. to 5ft. above the foundation block into the chimney wall as an additional security. The concrete filling is usually composed of 1 part of Portland cement to 3 parts of clean river sand.

These chimneys should not be built too quickly, as, owing to the impervious nature of the tile used, the concrete will take some time to arrive at its full strength, especially if a "wet" mixture is used. A point that requires consideration in all classes of concrete chimneys is the speed of erection; if this is too slow planes of separation between the old and the new concrete are liable to develop, while on the other hand if the progress is too rapid, the "green" concrete structure may be subjected to the full force of the wind with probably disastrous results. It is a very good precaution, in any case, to give ample laps to all the bars, or fix the ends together by mechanical means.

THE AGITATION AGAINST OFFICIAL ARCHITECTS.

That the agitation against the appointment of Government and civic architects is not confined to this country is apparent from the following particulars which we cull from our Australian contemporary "Building":—The New South Wales Institute of Architects sent a deputation on July 15th to wait upon the Minister for Works, and ventilate a professional grievance that is fairly common throughout Australia. It is the monopoly that the Government holds in the architecture of public buildings. In some States, Queensland, for instance, it is not so pronounced. In no other country do we find large public buildings, such as our National Library, the new Parliament Houses, the Registrar-General's Offices, withheld from public competition. The system of public competition has been found to work most satisfactorily in England, and other great centres. It is the only true system whereby the best results are obtained. As a

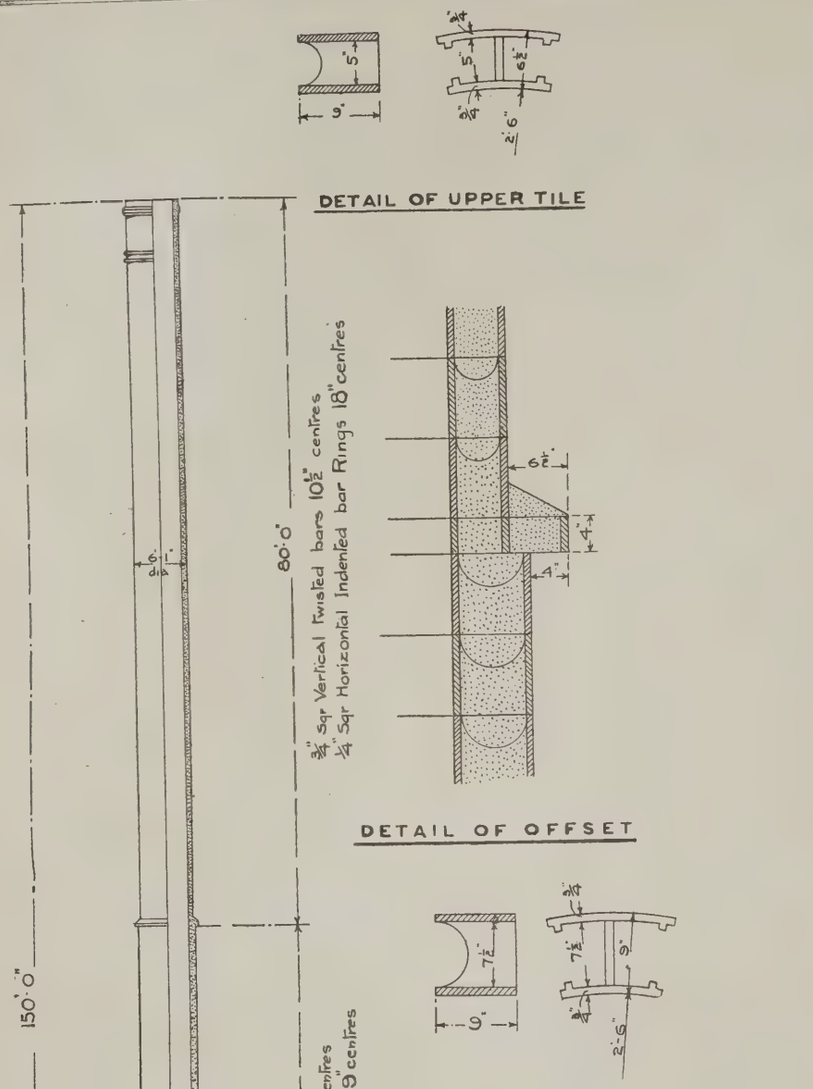

FIG. 10.—MODERN PRACTICE IN TALL CHIMNEY CONSTRUCTION, *See previous page.*

graphic illustration, take the great competition for the London County Council Hall, which brought to public notice undoubted talent in a young man who otherwise would never have had the opportunity of obtaining recognition of his ability. This question must be considered by every Government for granting fair opportunity for the best development of its native talent. There is a mistaken notion that it is desired to do away with the position of Government architects. It should be remembered that the adoption of a proper competitive system will still necessitate the retention of the services of an architect possessing the attainments of the existing Government architect, as in England, where the Government architect is retained to advise and observe that the accepted competitive design is carried out in all its details. There is, however, one point that stands out clearly in all the agitation, and that is the high esteem universally held for the present Government Architect, Mr. W. L. Vernon, F.R.I.B.A., whose high capabilities have never been questioned.

Bankruptcies.

Beach, Chas., builder, 50, Argyle Avenue, Whitton Park, Hounslow. Adj. Aug. 12.

Beckett, Joseph Fountain, builder, contractor, and undertaker, Upwell, Isle of Ely. 1st meeting, O.R.'s, Norwich, Aug. 22. P.E., C.C., King's Lynn, Aug. 20. Adj., Aug. 10.

Broadbank, Caleb Geo., house decorator, 5, Park Road, and Wellesley Road, Ashford. R.O., Aug. 14. Adj., Aug. 14.

Cowap, Joseph, plumber and decorator, 645, Oldham Road, Newton Heath, Manchester. R.O., Aug. 14. 1st meeting, O.R.'s, Manchester, Aug. 26. at 3.30. P.E., C.C., Manchester, Sept. 18, at 10. Adj., Aug. 14.

Daw, Ada Cecilia (widow, trading as H. L. Daw), retailer of wallpapers and house-decorating materials, 108, Commercial Street, Newport. R.O., Aug. 15. Adj. same day.

Dyett, Herbert Chas., builder, 4, South View Road, Shirley, Southampton, and High Street, Woolston. R.O., Aug. 13. 1st meeting, Midland Bank Chambers, High Street, Southampton, Aug. 26, at 11.30. P.E., C.C., Southampton, Oct. 28, at 12. Adj., Aug. 13.

Eardley, Bertram Cooper, plumber, Moorland Road, Burslem. R.O., July 31. 1st meeting, O.R.'s, Newcastle, Aug. 26, at 3.30. P.E., Town Hall, Hanley, Aug. 26, at 11. Adj., Aug. 14.

Foulkes, Hy. Cresswell, builder, 149 and 150, Finsbury Pavement House, E.C. Adj., Aug. 14.

Hibbs, Geo., contractor, 13, Clarence Villas, Connaught Road, Margate. R.O., Aug. 10. 1st meeting, O.R.'s, Canterbury, Aug. 27, at 11. P.E., Guildhall, Canterbury, same day at 10. Adj., Aug. 11.

Javens, Jas. Joseph, late joiner and builder, lodging at Park Road, Carlton. R.O., Aug. 13. Adj., same day.

Mackenzie, Tom, builder and contractor, Workington Road, and Gravel Street, Maryport. R.O., Aug. 10. 1st meeting, C.C., Cockermouth, Aug. 24. P.E., same.

Nicholls, Jno. Wood, and Harry Beaumont James (partners in the firm of Nicholls and James), builders, Whyteleafe, Upper Caterham. Adj., Aug. 10.

Robbins, Thos., jobbing builder and painter, 11, Bordesley Green Road, Birmingham. R.O., Aug. 15. Adj., same day.

Strevens, Edmund Joseph (described in R.O. as E. J. Strevens), architect and surveyor, 292, Camberwell New Road. Adj., Aug. 10.

Tinson, Eli, builder, 169, Warwick Road and Shaftesbury Road, Kensington. R.O., Aug. 10. 1st meeting, Bankruptcy Court, Aug. 24. P.E., same Sept. 29, at 11.30. Adj., Aug. 10.

Warne, Jno. Wm., builder and contractor, Albert Inn, Albert Street and Tennyson Avenue, King's Lynn. 1st meeting, O.R.'s, Norwich, Aug. 22. P.E., C.C., King's Lynn, Aug. 20. Adj., Aug. 13.

Watkins, Thomas, plumber, 14, Gower Street, Swansea. 1st meeting, O.R.'s, Swansea, Aug. 25. P.E., Town Hall, Swansea, Sept. 25, at 11.30.

Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

Free £500 Insurance Coupons have this week been sent to the following:—

J. E. S. (St. Monans), G. T. B. (Wrexham), S. W. (Sowerby Bridge), J. H. B. (Burnley), W. T. (Galashields), E. S. (Oldham), J. F. H. (Barnstaple), A. H. N. (Wakefield), A. O. G. (Birmingham), W. J. Heavy Fireclay Slop Sinks.

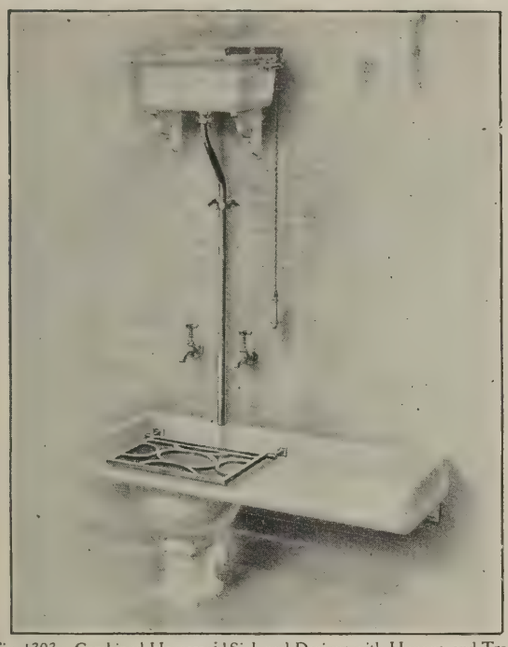

Fig. 1303. Combined Housemaid Sink and Drainer with Hopper and Trap.

COMBINED

HOUSEMAID'S SINK.

¶ Completely fitted to answer every modern demand from the points of view of Convenience, Sanitation, and Efficiency.

¶ All corners are rounded. The glaze used, which is leadless, gives an absolutely smooth and bright surface, and thus the collection of dirt is rendered absolutely impossible.

¶ Designs and Estimates submitted for every class of Sanitary Appliance for Public Buildings, Hotels, Hospitals, Schools, Offices, Workshops, or Private Houses.

Late News.

(*See also p. xxviii.*)

A residence for the French Ambassador at Washington, U.S.A., is being designed by M. Berner, Member of the Institute.

Renfrew's new high school, which was opened recently, has a total floor area of 3,000 sq. ft., with class-room accommodation for 780 pupils, and was designed by Mr. John Arthur, of Glasgow.

A Baptist church for Pendleton, for which Messrs. Cook and Son, of Manchester, have prepared the designs, is to provide accommodation for 450 persons, and is estimated to cost £2,500.

A new parish hall at Treharris will hold 205 persons on the ground floor, and the same number in the basement, and has cost about £1,440 to build. Mr. W. Dowdeswell prepared the plans and supervised the work.

Heating contracts have been secured by Messrs. J. F. Phillips and Son, of Richmond Buildings, Brighton, and 21, Old Queen Street, Westminster, for the Royal Portsmouth Hospital, Portsea; new secondary schools at Chichester; and new elementary schools at Ramsgate. Messrs. Phillips, who install Barker's patent cable system of vacuum hot-water heating, have recently completed the heating of new Council schools at Cowes, Isle of Wight, at Union Church and Institute, Brighton; and at the Standard Tablet Company's Factory, Hove.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

August 27. HUDDERSFIELD.—Erection of a two-storey warehouse at Longroyd Mills, Thornton Road. Plans may be seen and bills of quantities obtained at the office of J. Berry, architect and surveyor, 3, Market Place, Huddersfield. Tenders, free of charge, must be sent to the architect by August 27.

August 27. PORT TALBOT (WALES).—Erection of new premises, for the Taibach and Port Talbot Co-operative Society. Plans and specifications to be seen on the premises. Tenders must be delivered by August 27 to the committee, sealed and endorsed "Tenders." A deposit of £1 1s., to be returned if tender not accepted.

August 27. BANGOR.—Erection and completion of a museum at the rear of the free library, Bangor, for the museum and general purposes committee. Drawings, specifications and conditions may be seen at the surveyor's office. Tenders, addressed to John Gill, A.M.Inst.C.E., city surveyor, city surveyor's office, Bangor, and marked "Museum," to be delivered not later than 5 p.m. on August 27.

August 27. FARNWORTH, LANCS.—Erection of destructor building, approach road, and extension of electricity works in Albert Road, for the Urban District Council. Drawings may be seen and specifications, quantities, and forms of tender obtained at the offices of the engineer, W. J. Lomax, A.M.I.C.E., 11, Fold Street, Bolton, on a deposit of a cheque for £2, which will be returned on receipt of a bona fide tender. Tenders, sealed and endorsed "Destructor," to be delivered to W. Tyldsley, clerk, Council Offices, Farnworth, by 10 a.m. on August 27.

August 28. MANCHESTER.—Repairs to river wall, Philips Park Cemetery, for the Corporation. Drawing may be seen and specification and form of tender obtained on application at the city surveyor's office, town hall, Manchester, on payment of two guineas, which sum will be returned on the receipt of a bona fide tender. Cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope and addressed to the chairman of the parks, etc., committee, are to be delivered at the city surveyor's office not later than 9.30 a.m. on August 28.

August 28. DARTFORD.—Erection of a playshed and improvements to the ventilation, also for a urinal and removal of gallery at Dartford Heath Street, York Road, and West Hill council schools. Specifications can be seen and further information obtained at the office of Miss M. L. Dixon, 8, Hythe Street, Dartford. Tenders sealed and endorsed must be forwarded to Miss Dixon not later than 4 o'clock on August 28.

August 29. WINTERSLOW.—Erection of Wesleyan schoolroom and classrooms at Winterslow. For view of plans and specifications apply to Sidney J. M. Moody, Fisherton Street, Salisbury, to whom tenders must be sent not later than August 29, marked "Winterslow Schoolroom."

August 29. CHELMSFORD.—Erection of new offices, for the education committee of the Essex County Council, at Chelmsford. Drawings, specification, and conditions of contract may be seen on application to the architect. Applications for the bills of quantities and form of tender must be made to F. Whitmore, architect, 73, Duke Street, Chelmsford, on or before August 29, enclosing a cheque for five pounds, which will be returned on receipt of a bona fide tender. The contractor will be required to give the bond of an approved guarantee society in the sum of £500, for the due performance of the contract.

August 29. ROMSEY.—Erection of an additional building, comprising 5 new wards, nurses' room and offices, also alterations to the present building, for the trustees of the nursing home and cottage hospital. Drawings, specifications, and conditions of contract may be inspected at the offices of James Jenvey, architect and surveyor, Market Place, Romsey. Bills of quantities and forms of tender may be obtained at same address on payment of one guinea, to be returned to those persons who send in a bona fide tender in the forms provided. Sealed tenders, in envelopes to be supplied, must be sent in to the architect on or before August 29.

August 29. ROTHWELL.—Reconstruction of under oven bridge on the Leeds and Barnsdale main road, within the urban district of Rothwell, for the West Riding County Council. The bridge has a span of 16 ft. General conditions, specification, and bill of quantities may be obtained at the office of the surveyor. A deposit of £1 will be required, which will be returned on receipt of a bona fide tender. Cheques, etc., should be forwarded to the West Riding treasurer, at the county hall, Wakefield. Plans may be seen at the office of the West Riding surveyor. Sealed tenders, duly endorsed, to be delivered not later than 10 a.m. on August 29, to F. G. Carpenter, West Riding surveyor, County Hall, Wakefield.

August 31. TONYPANDY.—Erection of business premises in Bridge Street, Tonypandy. Tenders to be delivered to Mrs. Williams, Anchor House, Tonypandy, where plans and specifications may be seen, by August 31, endorsed "Tender."

August 31. METHLICK. — Mason work of buildings, for the trustees of Beaton Hall, Methlick. Plans and specification may be seen with James Cobban, architect, Haddo House; and sealed tenders will be received by him up to 10 o'clock on August 31.

August 31. WREXHAM.—Construction of a new goods yard and sidings at Wrexham, for the directors of the Great Western Railway Co. Plans and specification may be seen, and forms of tender and bills of quantities obtained, at the office of the resident engineer at Birmingham (Snow Hill) Station, between 10 a.m. and 4 p.m. Tenders, marked outside "Tender for Works at Wrexham," must be sent to G. K. Mills, secretary, Paddington Station, London, by August 31.

August 31. CALE GREEN.—Erection of high school for girls, Beech Road, Cale Green, for the Corporation of Stockport. Spalding and Spalding, King Street, Cheapside, London, architects. Persons desirous of tendering for the whole of the works are requested to send their names, together with a deposit of £3 3s., which will be returned on receipt of a bona fide tender, to Arthur Lawton, secretary to education committee, education offices, town hall, Stockport, not later than August 31, after which date bills of quantities will be supplied and the drawings and conditions of contract may be inspected. Fair wages clause.

August 31. MANNINGHAM.—Works of all trades required in the erection of branch library, Carlisle Road, Manningham, for the Bradford Corporation. Drawings and general conditions of contract may be seen, and bills of quantities and form of tender obtained, on application to the city architect, Whitaker Buildings, Brewery Street, Bradford. Sealed and endorsed tenders must be sent to Frederick Stevens, town clerk, Town Hall, Bradford, not later than noon on August 31. The contract will be let subject to the fair contracts clauses of the Corporation, which may be seen at the town clerk's office, and which the accepted contractors will be required to sign.

August 31. STRETFORD.—Extension of buildings at the electricity works, Longford Bridge, Stretford, for the Urban District Council. Bills of quantities, drawings, and other particulars can be obtained on application to Ernest Woodhouse, F.R.I.B.A., 88, Mosley Street, Manchester, on payment of a fee of two guineas, which will be returned on receipt of a bona-fide tender. Tenders in sealed envelopes and endorsed "Tender for Buildings" to be addressed to the chairman of the electricity committee, council offices, Old Trafford, and delivered not later than noon, August 31.

August 31. LITHERLAND.—Construction of stabling, etc., at the council's depot, School Lane; 2, construction of new mortuary, situated on canal side, opposite council's depot, Church Road, for the Urban District Council. Drawings and specifications may be seen and quantities, forms of tender, and all other particulars obtained on application to A. H. Carter, surveyor to the council, public offices, Sefton Road, Litherland, on payment of the sum of £1 1s., which will be returned on receipt of a bona fide tender. Sealed tenders endorsed "Tender for Stables and Mortuary," to be sent to William Kirk and J. W. Allen North, clerks to the council, at or before noon, August 31.

September 1. SALISBURY.—Erection of stables in Friary Lane, for the Urban District Council. Plans and specification can be seen, and bills of quantities with form of tender obtained on application to W. J. Goodwin, A.M.Inst.C.E., city engineer and surveyor, Municipal Offices, Salisbury. Tenders, endorsed "Stabling," must be delivered not later than 3 p.m. on September 1, to Francis Hodding, town clerk, Municipal Offices, Salisbury.

September 1. BIRMINGHAM. — Erection of umbrella roof coverings over platforms at Birmingham (Snow Hill) station, for the Great Western Railway. Plans and specifications may be seen and forms of tender and bills of quantities obtained at the office of the new works' engineer at this station, between the hours of 10 a.m. and 4 p.m. Tenders addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Roof Coverings, Birmingham," will be received by September 1.

September 1. KENNYHILL.—(1) Digger, mason and brick works; (2) carpenter, joiner, glazier, and ironmongery works; (3) slater work; (4) plaster work; (5) plumber, gasfitter and bellhanger works; (6) painter work of three tenements of dwelling-houses to be erected in Cumbernauld Road, Kennyhill, for the Corporation of Glasgow. Plans may be seen and copies of the specification, schedule of quantities, and form of tender obtained on application at the office of the city engineer, 64, Cochrane Street. Tenders, marked "City Improvements Department, Kennyhill Tenements. Tender for ..... Works," to be lodged on or before September 1, with A. W. Myles, town clerk, city chambers, Glasgow.

September 2. KENFIG HILL (WALES).—Erection of a school hall for the English Presbyterian Church at Kenfig Hill. Plans and specification may be seen at the office of Arthur Lloyd Thomas, architect and surveyor, Church Street chambers, Pontypridd. Sealed and endorsed tenders must be sent to Edgar Ware, secretary, Crescent Place, Kenfig Hill, by September 2.

September 2. PECKHAM RYE.—Erecting a wall and executing other work at Peckham Rye, London, S.E., for the Metropolitan Asylums Board. Form of tender, with conditions of contract and specification, may be obtained at the office of the board, Embankment, E.C., on payment of a deposit of £1, which will be returned only on receipt of a bona fide tender. Plan may be seen at the offices of T. W. Aldwinckle and Son, 20, Denman Street, London Bridge, S.E., between 10 a.m. and 4 p.m. (Saturdays 10 a.m. and 1 p.m.). Tenders properly endorsed, and addressed to T. Duncombe Mann, clerk to the board, must be delivered at the office of the board, by noon on September 2.

September 2. CARSHALTON.—Making and fixing joinery fittings at the Southern Hospital, Carshalton, Surrey, for the Metropolitan Asylums Board. Plans, specification, and conditions of contract may be seen at the offices of the architects, Treadwell and Martin, 29a, Charing Cross Road, London, W.C. between 10 a.m. and 4 p.m. (Saturdays 10 a.m. and 1 p.m.). Copy of tender form and bills of quantities may be obtained on and after August 27 at the office of the Board, Embankment, E.C., on payment of a deposit of £5, which will be returned only on receipt of a bona fide tender. Tenders, properly endorsed and addressed, must be delivered at the office of the board by noon, on September 2.

September 3. THURNSCOE.—Excavator, mason, and bricklayer, carpenter and joiner, slater, and plasterer's work required in the erection of 18 houses for proposed garden village at Thurnscoe, for the Barnsley British Co-operative Society, Ltd. Plans and details may be seen and quantities and specification obtained, on application at the office of the architect, on payment of one guinea, which will be returned on receipt of bona fide tender. Tenders, sealed and endorsed "Houses, Garden Village," must be delivered not later than 2 p.m. on September 3, to Ernest W. Dyson, architect and surveyor, 10, Regent Street, Barnsley.

September 4. CHEPSTOW.—Additions to the master's residence at the Chepstow workhouse for the Guardians of the Poor. Plans and specification can be seen at the workhouse offices, or at the office of the architect, John W. Rodger, 14, High Street, Cardiff. Bills of quantities can be obtained on application to the architect. Sealed tenders, endorsed "Master's Apartments," are to be delivered to Fothergill Evans, clerk, Union Offices, Chepstow, Mon., not later than September 4.

September 7. NEWPORT (MON.)—Erection of a new building and adaptation of existing premises in accordance with drawings and specification prepared by the architects, C. E. Compton, M.S.A., and Habershon, Fawckner, and Co., High Street, Newport, for the building committee of the Y.M.C.A. Drawings, specifications, and conditions of contract may be inspected at the office of the architects, and copies of the quantities can be obtained at the office of the quantity surveyor, Charles Miles, Central Chambers, Newport, upon payment of a deposit of two guineas,

returnable upon receipt of a bona fide tender. Sealed and endorsed tenders, on the printed forms supplied, must be received by Geo. W. Rankin, buildings' secretary, at Bronheulog, Church Place, Penarth, Glam., not later than nine a.m., on September 7.

September 9. SHEERNESS.—Erection of hall upon site at corner of High Street, and St. George's Road, Sheerness, for the trustees. Plans and specification may be seen between the usual office hours at the office of the architect, 21, Balmoral Road, Gillingham, Kent, and copy of the bills of quantities obtained upon receipt of fee of 10s. 6d., which will be returned upon receipt of a bona fide tender on lithographed form supplied. Sealed tenders to be addressed to J. Auty, secretary to trustees, 3, Trinity Road, Sheerness not later than noon on September 9, endorsed "Tender for Masonic Hall, Sheerness."

September 9. LONDON, W.—Erection of a block of shops and showrooms at 143-9, Great Portland Street, London, W. Drawings, specification, and conditions of contract may be inspected at the offices of the architects, John W. Simpson and Maxwell Ayrton, 3, Verulam Buildings, Gray's Inn, W.C., from August 24 to Sept. 8, between 10 and 4. Bills of quantities and forms of tender may be obtained at the same address on payment of three guineas. The sums so paid will be returned to those persons who send in tenders on the forms provided in conformity with the conditions. Tenders must be delivered before noon on Sept. 9, addressed to the Owner, Great Portland Street site, care of Messrs. Jubber and Co., 61, Great Portland Street, W., and endorsed "Tender for Shops and Showrooms."

September 9. LETCHWORTH GARDEN CITY.—Erection and completion of a new County Council school at Letchworth Garden City, for the Education Committee of the County Council. Persons desiring to tender for the work may see the drawings, specification, agreement, etc., at the county surveyor's office, Hatfield, between the hours of 10 a.m. and 4 p.m., except on Saturday, when they may be seen from 10 a.m. till 12 noon. A copy of the schedule of works (quantities) and a form of tender can be obtained at the county surveyor's office, on or after the above-mentioned date, upon payment of two guineas, which sum will be returned to the tenderer upon receipt of a bona fide tender and the documents which have been supplied to him. Sealed tenders, endorsed 'Tender for New School, Letchworth," must be delivered to Urban A. Smith, county surveyor, County Surveyor's Office, Hatfield, not later than 5 p.m. on September 9. Such security for the due execution of the works as the council may require must be given by the contractor.

September 12. KILLALOE (Co. Clare).—Erection and completion of a new chapel at Garraunboy, Killaloe, Co. Clare, for the Very Rev. Canon D. Flannery, P.P., and committee. Drawings and specification may be seen at the parish priest's house, Killaloe, or at the office of the architects. Bills of quantities for the use of builders tendering can be had at the office of O'Malley and O'Rourke, architects, 10, Glentworth Street, Limerick, or with the parish priest. Sealed tenders, endorsed "New Chapel, Garraunboy," accompanied by bills of quantities, must be delivered to the parish priest on or before September 12. Two solvent sureties required for the due performance of the contract.

September 14. HERTFORD.—Erection and completion of a new county record and strong room at Hertford, for the County Council. Persons desiring to tender may see the drawings, specification, agreement, etc., at the county surveyor's office, Hatfield, between the hours of 10 a.m. and 4 p.m., except on Saturdays, when they may be seen from 10 a.m. to 12 noon. A copy of the schedule of works (quantities) and a form of tender can be obtained at the county surveyor's office upon payment of two guineas, which sum will be returned upon receipt of a bona fide tender and the documents which have been supplied. Sealed tenders, endorsed "Tender for New Record and Strong Room, Hertford," must be delivered not later than 5 p.m. on September 14, to Urban A. Smith, county surveyor, county surveyor's office, Hatfield. Such security for the due execution of the works as the county may require must be given by the contractor.

September 15. OXFORD.—Erection of the new church of St. Stephen, Lonsdale Road, Summertown, Oxford, for the building committee. Plans, specification of works, and conditions of contract may be seen, and form of tender, with bills of quantities obtained, at the office of A. Mardon Mowbray, architect, 117, St. Aldate's Street, Oxford, during office hours, on payment of five guineas, which will be returned on receipt of a bona fide tender. The contractor will be required to enter into a bond, with two responsible sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. Tenders, sealed and endorsed "Summertown New Church" to be delivered not later than noon on September 15, to Rev. C. J. Burrough Summertown Vicarage, Oxford.

September 21. SUTTON COLDFIELD.—Erection of a school to accommodate 200 children in the Green Lanes, Chester Road, for the Corporation. Specification and quantities may be obtained from Crouch, Butler, and Savage, architects, 39, Newhall Street, Birmingham, on deposit of two guineas. Tenders, marked "Green Lanes School," to be delivered on or before September 21, to R. A. Reay Nadin, town clerk, council house, Sutton Coldfield.

No date. ARNOLD.—Erection of a Baptist chapel, Cross Street, Arnold. Builders desirous of tendering are requested to apply to W. H. Higginbottom, architect, Friar Yard, Friar Lane, Nottingham.

No date. WORMINGFORD.—Alterations and additions at the Grove, Wormingford, for T. Eustace Smith, Esq. Plans and specifications may be seen at the office of J. W. Start, F.S.I., architect and chartered surveyor, Colchester.

No date. KINGSTON-BY-SEA.—Erection of new balconies and carrying out of other work at the infirmaries, Kingston-by-Sea, for the Guardians of Steyning Union. Persons desirous of tendering are requested to send their names to Arthur Flowers, clerk to the guardians, union offices, New Shoreham, Sussex, when the plan and specification prepared by the board's architects (Clayton and Black) will be sent to them.

ENGINEERING.

August 28. MANCHESTER.—Work required in boring and lining a deep well, and the supply and erection of pumping plant on land adjoining the Stuart Street generating station, for the electricity committee of the Corporation. Specification and form of tender may be obtained on application to F. E. Hughes, secretary, electricity department, Town Hall, Manchester, on payment of one guinea, which amount will be refunded on receipt of a bona fide tender. Further particulars and information may be obtained from S. L. Pearce, chief electrical engineer, Dickinson Street, Manchester. Tenders, duly endorsed and addressed to the chairman of the electricity committee, must be delivered at the town hall before 10 a.m. on August 28.

August 28. CORK. — Making, supplying, and fixing hot water heating apparatus in city hall, Albert quay, and Carnegie free library, Anglesea Street, Cork, for the Corporation. Plans, specification, and conditions of contract prepared by the city engineer. General conditions, specification of requirements, and plans of buildings can be seen or obtained in the city engineer's office, city hall, from 10 to 4 daily, where tender forms will be issued. Intending contractors when making application for the necessary information must first lodge with the city treasurer the sum of £1, which sum will be returned when a bona fide tender is sent in. All materials to be, where possible, of Irish manufacture. Sealed tenders, endorsed "Tender for Heating City Hall, and Carnegie Library," must be deposited before 2 p.m. on August 28, with F. W. McCarthy, town clerk, City Hall, Cork. Fair wages clause.

September 7. DUBLIN.—Construction of five deviations on the main line of the Tralee and Dingle Light Railway, comprising the removal of about 32,000 cubic yards of earthwork, the erection of 3¼ miles of fencing, the building of a bridge over the river Finglas. The provision of broken stone, and the execution of various other works, for the public works board. Copies of plans and specification may be seen at the secretary's office, or at the offices of the Tralee and Dingle Railway company, Tralee, county Kerry. Copies of the specification will be supplied from the office of public works on payment of £1 1s., which will be refunded on receipt of a bona fide tender. Sealed tenders, addressed to H. Williams, secretary, office of public works, Dublin, will be received up to 10 a.m. on September 7.

September 7. DERBY.—Construction of 6 separator tanks and pump-house, together with all the necessary culverts, pipes, and other works connected therewith. Drawings may be seen and copies of specification and bills of quantities obtained at the office of the engineers, James Mansergh and Sons, 5, Victoria Street, Westminster, on the deposit of cheque or banknote for £5, which will be returned after the receipt of a bona fide tender with the bills of quantities and schedules fully priced out. Sealed tenders, endorsed "Derby Corporation, Sewage Disposal Works Contract No. 7—Tender for Separator Tanks," are to be delivered at or before noon on September 7, to G. Trevelyan Lee, town clerk, town clerk's office, 15, Tenant Street, Derby.

September 15. LEITH.—Execution of the undermentioned works by a utilisation of the materials of the existing unfinished iron bridge over the Caledonian Railway Company's line at Victoria Park, for the Corporation of Leith. (1) Construction of a footbridge on the site of the bridge referred to. (2) Widening of Junction Bridge. All conform to relative plans and specifications to be seen at the surveyor's office. Offers, sealed and marked "Bridge," to be lodged with J. R. Findlay, burgh surveyor, Burgh Surveyor's office, 35, Charlotte Street, Leith, on or before September 15.

IRON AND STEEL.

August 31. MALDON.—Supplying 620 yds, of 6 in. and 4 in. C.I. water-mains, for the Corporation. Specification and form of tender may be obtained from the borough surveyor. Tenders, endorsed "Water-Mains," to be sent to F. H. Bright, town clerk, municipal offices, Maldon, Essex, on or before August 31.

September 5. WAKEFIELD.—Supply of about 20 tons of special cast-iron pipes, for the Corporation. Drawings and specification may be seen, and bills of quantities and form of tender obtained, at the office of C. Clemesha Smith, M.I.C.E., the waterworks engineer, Town Hall, Wakefield. Tenders, under cover, marked "Cast-iron Pipes," must reach W. W. Greenhalgh, town clerk, not later than September 5.

September 8. INDIA OFFICE, WHITEHALL.—Supplying girder bridges, 100 ft. and 40 ft. span, for the India Office. Conditions of contract may be obtained on application to E. Grant Burls, director-general of stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 o'clock p.m. on September 8.

September 8. LONDON.—1. Supply and delivery of the following steel rails, which will form the subject of separate contracts, for the L.C.C.: (a) About 3,600 tons of steel girder tramway track rails and fastenings; and (b) About 1,550 tons of steel slot rails, and about 590 tons of conductor tee rails. (2) Roadwork and platelaying required for the electrification, on the conduit system of traction, of tramways in Wandsworth Road, Lavender Hill, and East Hill, Wandsworth, from Nine Elms Lane to the terminus at East Hill; total length is equivalent to about 6¾ miles of single line. The contractor for the roadwork will be required to use the rails, etc., and the special work for the various junctions and crossovers, which will be provided by the council under other contracts, but all the remaining metal work and other materials will be included in the contract for roadwork. Persons desiring to submit tenders may obtain the specifications, bills of quantities, forms of tender, and other particulars from the chief engineer of the council, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment of the sum of £2 for each of the two specifications for rails, and £5 for the specification for road-work, etc. These amounts will be returned provided a bona fide tender shall have been sent in and not withdrawn. Full particulars on application at the County Hall before payment of the fee. Tenders should be delivered at the County Hall in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Track Rails," "Tender for Slot Rails and Conductor Tees," and "Tender for Roadwork, etc.," as the case may be. No tender will be received after 11 a.m. on September 8. Fair wages clause.

PAINTING & PLUMBING.

August 27. SURBITON.—Painting the outside and a portion of the interior of the council offices, for the Surbiton U.D.C. Specification and form of tender can be obtained upon personal application to Henry T. Mather, engineer and surveyor, Council Offices, Surbiton, any day during office hours. Tenders, made out on the forms supplied and enclosed and sealed up in official envelopes, must be delivered at the council offices at or before noon on August 27.

August 27. BRADFORD.—Painters' work required at several parks, recreation grounds, and cemeteries, for the Corporation. General conditions of contract may be seen, and specifications and form of tender obtained, on application to the city architect, Whitaker Buildings, Brewery Street, Bradford. Sealed and endorsed tenders must be delivered at the office of Frederick Stevens, town clerk, town hall, Bradford, on or before August 27. Contractors whose tenders are accepted will be required to sign the fair contracts clauses of the Corporation.

August 28. HARROGATE.—Painting several blocks of property. Particulars of J. R. Usher, 26, Dragon Parade, Harrogate. Tenders to be sent to J. Chippindale, on or before August 28.

September 1. LEEDS.—Painting, etc., at section 3 and the nurses' home of the union infirmary, Beckett Street, Leeds. Specification and form of tender may be obtained on application to the clerk to the Guardians, or will be sent on receipt of stamped addressed envelope, and must be received duly filled in not later than noon September 1, by Jas. H. Ford, clerk to the guardians, poor law offices, South Parade, Leeds.

September 2. BRENTWOOD and DARTFORD.—Cleaning and painting works at (i.) High Wood School, Brentwood, Essex; (ii.), small pox hospitals, Dartford, Kent, for the Metropolitan Asylums Board. Conditions of contract and specification prepared by W. T. Hatch M.I.C.E., M.I.Mech.E., engineer-in-chief. Specifications, conditions of contract, and forms of tender may be inspected at the office of the board, Embankment, E.C., and can be obtained upon payment of a deposit of £1 in respect of each institution. The amounts of the deposits will be returned after the receipt of bona fide tenders, and after the specifications have been returned. Tenders, addressed as noted on the form, must be delivered at the office of the board not later than 10 a.m. on September 2.

ROADS AND CARTAGE.

August 27. HARROGATE.—Private street works required in streets off St. Mary's Walk, for the Corporation. Tenders must be submitted not later than 9 a.m. on August 27, to F. Bagshaw, borough engineer and surveyor, at whose office the specification may be seen, and quantities obtained.

August 27. DEWSBURY.—Paving, flagging, etc., of Oastler Street, for the Corporation. Plans, specifications, etc., may be seen and forms of tender obtained, on application to the borough surveyor's office, town hall, Dewsbury. Tenders under sealed cover, endorsed "Private Street Paving," must reach H. Ellis, town clerk, town hall, Dewsbury, not later than August 27.

August 29. INVERBERVIE.—Laying concrete footways, etc., in the burgh of Inverbervie. Plans may be seen of James Andrew, burgh chamberlain, Bervie; and schedule of measurement may be obtained from the burgh surveyor, John Sim, C.E., Montrose, on payment of a fee of 10s. 6d., which will be returned to all bona fide offerers. Sealed offers, marked "Tender for Footways," must be lodged with the burgh chamberlain, not later than August 29.

August 31. EMLEY (near Wakefield).—Steam rolling within the district, for the Emley U.D.C. Price per day to be quoted. Sealed tenders to be sent to F. C. Heath, clerk, on or before August 31.

August 31. COVENTRY.—Paving 7,500 sq. yds. with 4 in. granite cubes and other work in connection therewith, for the Gas Committee of the Corporation. Forms of tender, specification, bill of quantities, and general conditions may be obtained, and drawing may be seen, on application to Fletcher W. Stevenson, engineer and general manager, Gas Works, Coventry, and on payment of one guinea, which will be returned on receipt of bona fide tender. Sealed tenders, addressed to the chairman of the gas committee, Gas Works, Coventry, must be delivered by first post August 31, endorsed "Tender for Paving."

August 31. LYMINGTON.—Supply and delivery (by rail or water) of about 235 tons of either Devonshire granite or basalt, broken to 2 in. gauge, and about 15 tons of granite chippings, broken to ¾ in. gauge, for the Corporation. Samples to be forwarded to F. Hill Parr, borough surveyor, and tenders (without forms), endorsed "Tender for Granite," to be sent to the town clerk not later than noon on Aug. 31. Tenders are also invited for steam rolling, etc., in the borough during the coming season (particulars of which can be obtained upon application to the borough surveyor). Tenders should be sent to J. Davis Rawlins, town clerk, town clerk's office, Lymington, Hants. not later than noon on August 31, endorsed "Tender for Steam Rolling, etc."

August 31. FAVERSHAM.—Supplying 655 tons (more or less) of Guernsey granite or basalt broken to a 2 in. gauge and 60 tons (more or less) of clean ½ in. Guernsey granite or basalt chippings, free from dust, for the Corporation. The material to be delivered on to the Town Wharf, Faversham, in accordance with the rules and regulations of the wharf, or into carts or trucks as may be directed by the borough surveyor. The whole of the material to be delivered in such quantities and at such times not later than December 25, as may be directed by the borough surveyor. Tenders must be accompanied by a sample of each material tendered for. No special forms of tender will be provided. Tenders, in sealed envelopes, endorsed "Road Metal," must be sent not later than noon on August 31 to Allan Tassell, town clerk, Faversham. Should a tender be accepted the person tendering will be required to enter into a contract with the Corporation for its due performance, and also to provide a certified weighbridge note with each cargo delivered.

September 1. MACCLESFIELD.—Workmanship and materials required in scarifying digging out, concreting, and paving gas road, portion of Waters Green, and Sunderland Street, main roads in the borough, for the Corporation. Plans, sections, and specification may be seen and bills of quantities obtained on application to the borough surveyor, at the town hall, upon payment of £2 2s., which will be returned on receipt of a bona fide tender. Sealed tenders (upon the forms supplied) to be delivered before 2 o'clock September 1, to Arthur T. Pattinson, town clerk, town clerk's office, District Bank Buildings, Macclesfield. Fair wages clause.

September 1. STROOD (Rochester).—Making-up, paving, and channelling Bingham Road, Frindsbury, situated partly in the city and partly in the rural district of Strood. Plans and specifications can be seen, and forms of tender obtained, as to that portion within the city at the city surveyor's office, Guildhall, Rochester, during office hours, and to that portion in the rural district of Strood at the office of the district surveyor, L. Randerson, Blendon Villa, Meopham, near Gravesend, between the hours of 9 a.m. and 5 p.m. daily. Sparate tenders, addressed as to the portion within the city to the town clerk, Rochester, and to that portion within the rural district of Strood to the clerk at the Rural District Council's offices, 13a, Gun Lane, Strood, Rochester, must be sent in by September 1.

September 1. SCUNTHORPE.—Supply of all material and execution of the works in laying out new Building Estate, Clayfield Closes, Scunthorpe, in the county of Lincoln. The works involved include the construction of streets and back roads, and kerbing the same, the provision of all sanitary and storm water sewers and manholes, and other works on the basis of a schedule of prices. Specifications and plans may be seen, and schedules with forms of tender obtained, at the office of A. M. Cobban engineer and surveyor, 12, Home Street, Scunthorpe. Sealed tenders are to be sent in on or before September 1, endorsed "Tenders for New Building Estate, Streets and Sewers," addressed to H. M. Hett, Esq., solicitor, 2, Trafford Street, Scunthorpe.

September 3. HOUNSLOW.—Making up Bulstrode Avenue, Hounslow, for the U.D.C. of Heston and Isleworth. Plans and sections may be seen, and specification, bills of quantities, and form of tender obtained from J. G. Carey, engineer and surveyor to the council, Council House, Hounslow, on payment of the sum of two guineas, which will be returned upon receipt of a bona fide tender. Sealed tenders, on the form provided, must reach H. J. Baker, clerk to the council, Council House, Hounslow, not later than noon on September 3, endorsed "Private Street Works, Bulstrode Avenue."

September 14. STREATHAM.—Making up and paving the following new streets, viz.:—(a) Thrale Road, Streatham. (b) Part of Crowborough Road, Streatham, between Chillerton Road, and Ramsdale Road. (c) Part of Ramsdale Road, Streatham, between Rectory Lane and Crowborough Road, for the Council of the Metropolitan borough of Wandsworth. Specifications and drawings may be seen, and forms of tender obtained at the borough engineer and surveyor's office, New Streets Department, 53, East Hill, Wandsworth, between 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in separately sealed envelopes, and endorsed "Tender for Paving —— Road," must be delivered to Henry George Hills, Town Clerk, Council House, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose not later than 4 p.m. on September 14. If required, the contractor must provide two sureties for the due execution of the contract. Fair wages clause.

September 16. BEXLEY HEATH.—Levelling, kerbing, channelling, tar paving, draining, and making good nine streets on the Oaklands and Broadway estates, and carrying out the Lion Road improvement, all at Bexley Heath, for the Urban District Council. Plans and sections may be seen and specification, conditions and bills of quantities obtained, on application to W. T. Howse, surveyor, council offices, Bexley Heath, and upon payment of two guineas, which sum will be returned upon receipt of a bona fide tender and the documents which have been supplied. Sealed tenders, together with fully priced in quantities endorsed "Private Street Works," must be delivered to Thos. G. Baynes, clerk to the council, council offices, Bexley Heath, Kent, not later than noon September 16.

SANITARY.

August 27. WILLIAMSTOWN, Penygraig. — Laying about 400 yards of 12 in. and 9 in. surface water drain at Williamstown, Penygraig, for the Rhondda U.D.C. Plans and specification may be seen and forms of tender obtained from W. J. Jones, engineer and surveyor, Public Offices, Pentre, Rhonda, on payment of a deposit of one guinea (to be returned on receipt of a bona fide tender). Sealed tenders must be delivered on or before August 27, addressed to the chairman of the council, Public Offices, Pentre. Fair wages clause.

August 31. HASTINGS.—Laying a pipe sewer in road at rear of Robertson Street, Hastings, and other work in connection therewith, for the Corporation. Drawing and specification may be seen, and form of tender obtained, at the office of the borough engineer, P. H. Palmer, M.I.C.E., town Hall, Hastings, between the hours of 10 a.m. and 5 p.m. Tender, under cover, endorsed "Tender for Sewer at rear of Robertson Street," must be delivered not later than noon on August 31, to Ben. F. Meadows, town clerk, town hall, Hastings.

August 31. HARWICH.—Execution of the following works for one year from October 1, for the Tendring R.D.C. Lawford, Manningtree, and Mistley. — House refuse removal, cleansing of street gullies, etc. Parkeston.—House refuse removal, cleansing of street gullies, attention to sewage tank, etc. Kirby.—Attention to sewage tanks, cleansing of effluent ditch, flushing of sewers, etc. St. Osyth.—Cleansing of sewage tanks. Further particulars may be obtained upon application to the clerk to the council, or the inspector of nuisances, E. H. Grant, of Thorpe-le-Soken. Tenders must reach A. J. H. Ward, clerk to the council, 42, Church Street, Harwich, not later than August 31.

September 1. WATFORD. — Construction of about 130 yds. lineal of 6 in. stoneware pipe sewers, with the necessary inspection chambers, etc., for the Urban District Council. Persons desirous of contracting for the work may see the drawings and specification and obtain the form of tender on application to D. Waterhouse, engineer, council Offices, High Street, Watford. Sealed tenders, addressed to the clerk to the council, and endorsed "Tender for Sewerage," must be delivered under cover to H. Morten Turner, clerk, Council Offices, 14, High Street, Watford, at or before noon on September 1.

September 2. CLACTON-ON-SEA.—Construction of 193 yards of 24-in. and 367 yards of 18-in. diameter stoneware pipe storm-water relief sewers in Rosemary Road, Clacton, together with all appurtenant works, for the Urban District Council. Plans may be seen and quantities and form of tender obtained at the office of the engineer, W. H. Radford, C.E., Albion Chambers, King Street, Nottingham, on deposit of two guineas, which will be returned on receipt of a bona-fide tender and the return of the quantities within two months of tendering. Plans may also be seen at the surveyor's office, town hall, Clacton-on-Sea. Sealed and endorsed tenders must be sent in to Geo. T. Lewis, clerk to the council, town hall buildings, Clacton-on-Sea, by noon on September 2.

September 9. GROOMBRIDGE.—Providing and laying about 200 yds. lineal of 9 in. stoneware pipes, and about 35 yds. lineal of 9 in. cast-iron pipes, together with the construction of manholes and other appurtenances, for the R.D.C. of East Grinstead. Drawings may be seen by appointment on and after August 31, at the office of the surveyor, Charles Turton, 6, High Street, East Grinstead, from whom, on and after the abovementioned date, copies of all bills of quantities, specification, schedule of prices, and forms of tender may be obtained on payment of the sum of one guinea, which will be returned on receipt of a bona fide tender and all documents received. Tenders sealed and endorsed "Groombridge Sewer Extension," must be delivered to Francis S. White, clerk to the council, 6, High Street, East Grinstead, before noon on September 9.

September 14. GALASHIELS.—Drainage and sewage purification works.—The town council of the Burgh of Galashiels have postponed the date for lodging tenders for the above works, which will now be received by J. B. Lumsden, town clerk, town clerk's office, Galashiels, up till 1 p.m. on September 14. The engineer, W. A. Baird Laing, or his assistant, will attend at the burgh buildings, Galashiels, on August 18 and 25, to accompany contractors over and point out the site of the works. Plans and drawings may be inspected at the engineer's office, 175, Hope Street, Glasgow, up to September 14. Specifications applicable to contract No. 3, being for the erection of pump house, with sludge tank and manager's house, and the formation of approach roads, has been withdrawn in the meantime.

September 15. BARKING. — Construction of about 325 lineal yds. of sewer and surface-water drain, 15 in. diameter, with manholes and catchpits complete, in connection with the Upney Valley drainage scheme, for the Urban District Council. Plans, sections, and details can be seen, and specification, conditions of contract, bill of quantities, and form of tender obtained, upon application to C. F. Dawson, surveyor to the council, public offices, Barking. The contractor whose tender is accepted will be required to employ, as far as possible only workmen resident within the district of Barking Town. Tenders are to be sent in, marked on the outside "Tender for Upney Valley Drainage," and addressed to the chairman of the public health committee, public offices, Barking, not later than 4 p.m. on September 15. Fair wages clause.

September 21. PRESTWICH.—Supplying and laying about 2,800 yds. of 24 in. diameter stoneware, or earthenware, and cast-iron pipe sewer, together with all necessary river, brook, ravine crossings, manholes, lampholes, overflows, and other appurtenant works, for the U.D.C. Detail drawings and specification by Sydney H. Morgan, A.M.Inst.C.E. Drawings may be seen and copies of the specification, bill of quantities, and general conditions of contract obtained at the office of Sydney H. Morgan, the council offices, Prestwich, Lancashire, between the hours of 10 a.m. and 12 noon, and from 2 p.m. to 4 p.m. each day, except Saturdays and Sundays, upon payment of two guineas, which will be returned on receipt of a bona fide tender, and the return of all documents within 14 days of notice that a tender has been accepted. The successful contractor will be required to enter into a bond, with approved sureties, for the due performance of contract. Tenders, endorsed "Tender for Main Outfall Sewer—Contract No. 1," must be sent not later than noon on September 21, to Lewis A. Orford, law clerk to the council, council offices, Prestwich, Lancashire.

MISCELLANEOUS.

August 28. RUSHOLME. Cleansing and repairing the Gore Brook in Birchfields Park, Rusholme, for the Corporation of Manchester. Drawing may be seen and specification and form of tender obtained on application at the city surveyor's office, town hall, Manchester, on payment of two guineas, which sum will be returned on the receipt of a bona fide tender. Cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope and addressed to the chairman of parks, etc., committee, are to be delivered at the city surveyor's office, not later than 9.30 a.m. on August 28.

ARCHITECT'S Assistant desires engagement; 6 years' general experience. — Sedgwick, Belvedere Road, Sunderland. 4367

ARCHITECT'S Junr., 5 years' London experience, neat draughtsman; good colourist, details.—Box 4480, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's Assistant (24); 9 years' London exp.; working drawings, specifications, superintendence, quantities and land surveying; prizeman, architectural drawing, and quantities; medallist building construction; excellent testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4498

ARCHITECT'S Assistant requires situation immediately; 7 years' varied experience; capable draughtsman, tracer, colourist, perspectives, details, specifications; assist quantities, supervision. Take charge; good education; 25th year; 35s. weekly.—Box 4522, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (22), good varied experience; excellent testimonials; working drawings, details, measuring, supervising, etc.; holder of numerous certificates; moderate salary.—Box No. 4433, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (27), first-class artistic draughtsman, travelling studentship winner, 11 years' experience; perspectives, quantities, etc.; moderate salary.—Scott, 28, Cromwell Terrace, Halifax. 4500

ASSISTANT A.R.I.B.A. (29), thirteen years' London Provincial experience; testimonials, references, working drawings, details, specifications, supervision perspectives, office work; well up in management; salary 2 guineas.—Apply A., 31, Cotswold Road. Westcliff-on-Sea, Essex. 4512

ARCHITECT'S Junior Assistant, good draughtsman, 6½ years experience, working drawings, details, perspectives, surveying, specifications; assist quantities; mod. sal. for experience in good office.—"H.," 53, Hartwood Road, Southport. 4489

ARCHITECT'S Junior Assistant; disengaged; (21); 4½ years' experience; neat draughtsman and colourist; details; specifications; surveying; assist with quantities.—Box No. 4474, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (26), disengaged, 10 years' experience; competent draughtsman, colourist, etc.; working drawings, details, surveying, levelling; specifications, specimens; excellent testimonials; moderate salary.—Box 4515, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's Assistant (24), desires engagement; seven years' general experience, working and detail drawings, specifications, superintendence, surveying and levelling; excellent references; moderate salary.—H. M., Parkhurst, Ilkeston. 4514

ARCHITECT-SURVEYOR'S assistant requires situation at once. Three building construction certificates, and Prelim. R.I.B.A.; articled to A.M.I.C.E. and M.S.A.; good all-round experience. Age 24.—Box 4492, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (33), disengaged; 14 years' experience in good offices; first-class testimonials, and references; can take charge; specimens sent; salary £2. — Box 4491, BUILDERS' JOURNAL Office.

ARCHITECT'S Junior Assistant desires engagement (21); 4½ years' experience; neat draughtsman; assist with quantities; good references.—knowledge of gas-engine; good refs.—T. S., 4, York Terrace, King's Road, Herne Bay. 4450

ARCHITECT and surveyor's assistant (24); eight years' experience; working drawings, details, design, surveying, specifications, quantities; student R.I.B.A., moderate salary.—Box 4495, BUILDERS' JOURNAL Office.

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4493

BUILDER'S assistant disengaged, 21 years' experience, comprising office routine, plans, specifications, quantities, outside supervision; measuring-up, levelling and surveying; good references; abstainer—L. J. Greaves, Prestwood, Great Missenden, Bucks. 4494

BUILDER, with nine years' experience in first-class house-building and general repairs, desires appointment; fair draughtsman, well up all trades, tradesman; moderate salary; highest references. —Box 4507, BUILDERS' JOURNAL Office.

BUILDER'S Assistant (24), 8 years in and outdoor experience with large London contractor; quantities, general office routine; assist estimating and supervision.—Box 4401, BUILDERS' JOURNAL Office.

BUILDER'S Assistant (23), disengaged; construction, surveying, mensuration; fair knowledge quantities and levelling; also costs, accounts, wages, etc.; good draughtsman; supervise jobs and assist estimating.—Box 4523, BUILDERS' JOURNAL Office.

CARPENTER and joiner, work wanted, piecework; any quantity; labour only; good references.—W., 14, Gorrings Park Avenue, Mitcham, Surrey. 4526

CARPENTER and joiner wants work; bench fixing, alteration, or jobbing. Could take charge of general work. Life abstainer. Good references. Age 32. Very energetic.—Pearson, 53, Hartham Road, Isleworth, W. 4471

CLERK of Works; age 30; practical and reliable; exceptional experience with buildings, plans, etc.; architectural training; would serve part time in office; cyclist.—Box 4464, BUILDERS' JOURNAL Office.

ENGINEER wants post, London or provinces; 12 years' experience; or undertakes preparations, calculations, quantities, designs, detail drawings, structural steelwork, and reinforced concrete.—Box 4451, BUILDERS' JOURNAL Office.

ESTIMATOR and building surveyor, Q.S.A., desires re-engagement with builder, architect, or surveyor; permanent or temporary; estimates, quantities, measurements, variations and accounts.—A 768, Fulham Road, London, S.W. 4501

EXPERT all-round Engineering draughtsman (over 10 years' experience) wishes for occasional work at his own home, or otherwise; lowest terms.—Freeman, 44, Horsell Road, Highbury, N. 4416

FOREMAN, decorator good colourman, grainer and paperhanger; able to estimate; thoroughly experienced in management of men, for general jobbing work; age 42; wages £2 per week.—Box 4524, BUILDERS' JOURNAL Office.

FOREMAN painter and decorator (well-experienced) wants re-engagement; not afraid of work. First-class references. Age 37.—Foreman, 16, Gambole Road, Garratt Lane, Tooting. 4431

FOREMAN of painters and decorators, take entire management of flats or estate; town or country; well up in all branches of building trades; total abstainer.—C/o G. N., Sanitary Works, Bridge Road, Chertsey. 4420

FOREMAN seeks engagement; shop or building; carpenter, joiner, practical, machinery, quick setter out; last refs. 7 years; age 38.—C. M., Cedars, Spring Road, Kempston, Bedford. 4483

GENERAL Foreman, of large and varied experience, thoroughly conversant with every branch of the trade, pushing and punctual; open to undertake any job; none too large; wages moderate.—J. M., 22, Eve Road, Tottenham. 4466

GOOD shopfitter and case-maker requires constant job; abstainer; refs. if required. Indoor hand. — Box 4388, BUILDERS' JOURNAL Office.

IMPROVER (Plumbing, Gasfitting), wants situation. Willing to fill up time.—A. R., 344, Commercial-road, Old Kent-road. 4455

MACHINIST seeks permanency; work spindle, planer, tenoner, morticer, dovetailer, sharpen saws, make cutters, take charge of small plant; country job preferred. — Machinist, 39, Cathnor Road, Shepherd's Bush, W. 4504

PLUMBER (Registered) wants re-engagement as leading hand or otherwise. Thoroughly practical in all latest sanitary improvements. Town or country.—R. P., 18, Chertsey Street, Tooting, S.W. 4482

PLUMBER, gas, hot water, lead-laying and sanitary, wants job, or constancy; town or country. —S. W., c/o Editor, Box 4510, BUILDERS' JOURNAL Office.

SANITARY work wanted by practical man, 16 years' experience, iron or earthenware, capable to take charge, or would give estimate for good work; good references; age 40; abstainer.—Box 4499, BUILDERS' JOURNAL Office.

SHOP Foreman of joiners seeks re-engagement, experienced, machinery, abstainer; reference; 11 years last situation; age 40.—T. R., 9, Second Avenue, Hendon, London, N.W. 4488

THOROUGHLY competent builder's book-keeper and general assistant requires engagement, 15 years' experience in London with builders and shopfitters; good reasons for leaving present berth; excellent references Age 32.—Apply Box 4414, BUILDERS' JOURNAL Office.

TO Property Owners.—Situation wanted on an estate or tenement property by a reliable man, aged 40, with a thorough practical experience of all repairs; capable of taking sole charge; distance no object.—Box 4503, BUILDERS' JOURNAL Office.

YOUNG Engineer (married), four years' Canadian experience, general engineering and concrete work (reinforced); returning to England, requires appointment; references from Can. Pack Railway. Apply T. B., 2, Grange Road, Ealing. 4505

YOUTH (age 18) requires situation in builder's or surveyor's office. Desirous of learning estimating. Three years' previous experience.—Apply W. B., 8, Medley Road, West Hampstead, N.W. 4441

Appointments Vacant.

ARCHITECT'S pupil, vacancy in busy West-end architect's office; small premium required but must be fond of drawing.—Stanley-Barrett and Driver, 23, York Place, Baker Street, W. 4521

EXPERIENCED representative wanted by well-known firm of lock manufacturers; must have influential connection amongst leading architects and contractors in London district; state salary required and full particulars of experience. — Box 4, 7, BUILDERS' JOURNAL Office.

TRAVELLER wanted, with established connection amongst architects, builders, contractors, decorators, etc., to sell our Artificial Marble, on salary and Commission; must have exceptional references as to ability. Apply by letter only, giving full particulars, and stating terms required, The Fassio Marble Company, Ltd., 46, Cannon Street, London, E.C. 4449

WANTED, for a permanency in the office of an old-established firm of surveyors in the city, a youth of good appearance and education, with previous office experience, who can write a good hand, quick and accurate.—Apply, in own handwriting, with copies of testimonials, stating salary asked, to Box 4457, BUILDERS' JOURNAL Office.

Business Wanted.

WANTED, a jobbing builder's business in London, suburbs preferred. Apply, stating all particulars, to Box 4415, BUILDERS' JOURNAL Office.

Businesses for Sale.

FOR Sale, a good old building business, in town of 10,000, at about £2,500, most of which could remain at 5 per cent. to good men; the business would suit joiner, bricklayer and painter; up-to-date shop and machinery.—Applicants for extended payment terms, must state amount of capital, age and class of work used to; good references indispensable.—Box 4452, BUILDERS' JOURNAL Office.

JOBBING builder and decorators' business in Suffolk; old-established; freehold house and premises for sale.—Box No. 4475. BUILDERS' JOURNAL Office.

Partnerships & Practices.

AN Architect and Surveyor practising in Essex is anxious to collaborate or enter into partnership with another architect practising within easy distance of Chelmsford. — Apply "Essex," Box 4508, BUILDERS' JOURNAL Office.

Dissolution of Partnership.

MR. A. E. TUTTE, architect and surveyor, having dissolved partnership with Mr. Cook (Cook and Tutte) and closed the offices at 394, Commercial Road, Portsmouth, has opened offices at 91, London Road, Portsmouth. 4496

September 2, 1908. Volume 28, No. 708

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

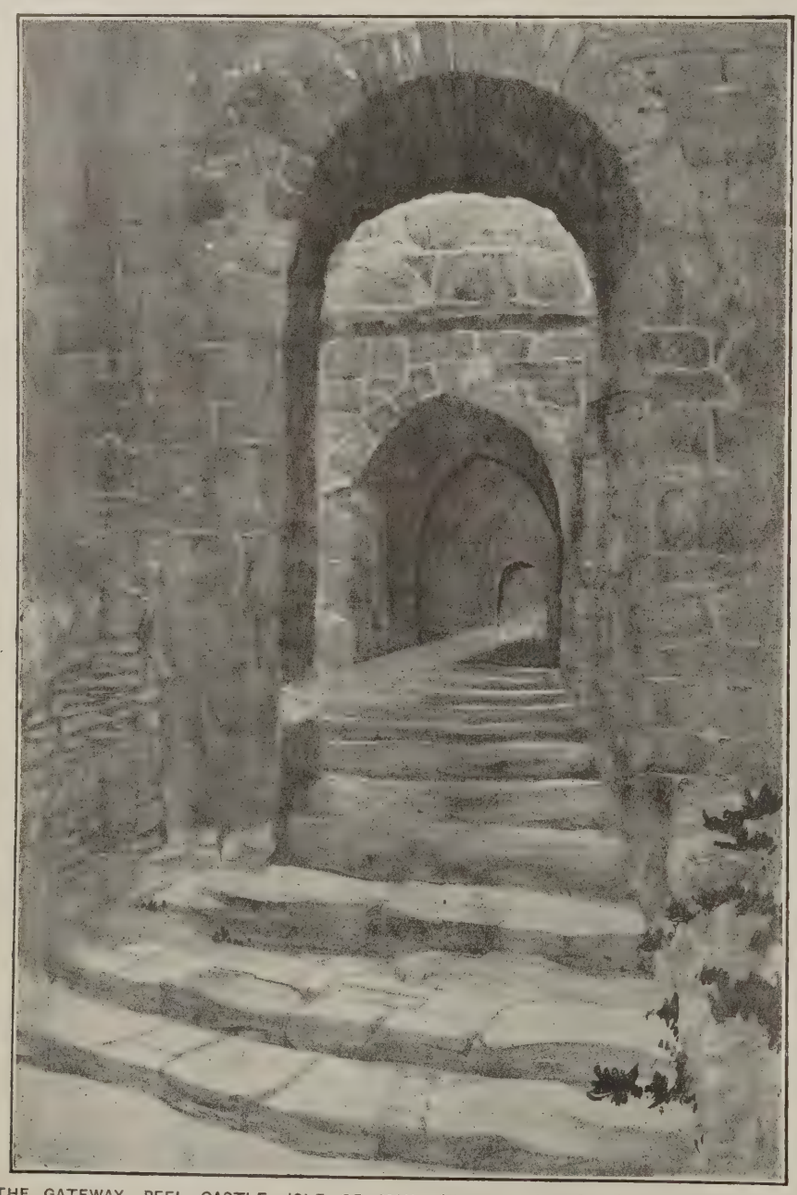
Out-of-work Architects.

The letter of "A Young Architect," which appeared in the "Daily Express" of August 25th, strikes at once a pathetic and a warning note. After three years' pupilage and sixteen years as chief draughtsman to one firm, the writer, "married, and with a family," finds himself "stranded and unable to get a situation, or any work to do. Such is the over-crowded state of the profession and the utter absence of work." Unfortunately this is by no means an isolated case. The numerous schools and training centres, with their excellent organisations and curricula, without doubt attract many lads towards a profession in which the majority of them can never hope to earn a bare living. Parents and guardians are liable to be enamoured of an occupation which is "respectable and gentlemanly"; and the absence of any legal check to the incursion of untrained and uneducated men, who live mainly on work obtained by undercutting the proper standard of fees, has contributed to the present condition of overcrowding; while the advent of this unhappy state of things has been considerably hastened by the present paralysing depression in the building trade. It is not too much to say that we are now face to face with a crisis in the profession of architecture. Well-qualified men are holding subordinate positions; numbers of assistants are out of work, many practically starving; and emigration holds out no prospects, for our Colonies seem to need architects as little as does Great Britain. Meanwhile, our schools and training centres are turning out scores of fresh men to swell the already overcrowded ranks. We have heard all kinds of explanations for this congestion. One is that the schools are sending out better-trained men who are ousting those of inferior education; another has it that the schools are responsible, and that they should be stopped for the present, or the number of their pupils regulated, as, in the nature of things, they must, if they are to continue, keep on tempting men into the profession for the sake of the fees; a third explanation, which also has the ring of truth, is that the profession is being over-run by men blessed with private means, or who are being supported by their relatives for an indefinite period; these men will work for nothing, and consequently turn out men who are working for their living. This is a real hardship, but it is by no means confined to the profession of architecture. The remittance man is not less a curse to society here than he is generally represented to be in Colonial circles. But of these three explanations, apart from the present depression in the building trade, which is the correct one?—or are they all true? Perhaps some of our readers can tell us!

London County Hall Again.

Criticism of the new County Hall for London is likely, it may be supposed, to continue either mildly or violently epidemic until some considerable time after the building is completed. Within the past few days there has been a fresh outbreak. The revised designs, one correspondent declares, have caused "much painful surprise and consternation." He seems to prefer the original elevation, for he complains that apparently the river frontage is now "to be shorn of its characteristic motif—the very architectural effect by which, on the verdict of the selected judges, chosen on the ground of their undeniably expert knowledge, the successful competitor triumphantly carried off the blue ribbon of the *concours*. As proposed to be altered, the design gives place to effects suggestive of two linked cotton-mills, with an apologetic architectural feature, apparently appliqué, to form something central, and thus, desperately, to save the situation. A more disastrous result of meddling interference, frustrating an art work of national importance for the frontage of our noble river, can hardly be conceived. If this is to be the outcome of an occasion such as was responded to by Wren, Chambers, and Barry, and the result of well-won distinction in the keen struggle of competition, then may architects prudently think twice lest their crown of success should prove ultimately to be one of disappointment and sorrow." This is really very pathetic; and if Mr. Knott is fated to have many more such friends sympathetically weeping upon his bosom, his cup of sorrow will soon be overflowing, and he himself will be in no small danger of representing, in his own proper person, a modified river frontage. Almost any kind of criticism may be useful, but it need not be lugubrious; and the reference to Wren, Chambers, and Barry, suggests no more appropriate reflection than that, contrary to the correspondent's tacit implication, each of these architects, in his day, suffered more from "meddling interference" than Mr. Knott is ever likely to endure, even supposing that he has the good fortune and the ability to attain to their eminence. Such "sufferance is the badge of all our tribe."



Trees for Towns.

That the builder is the inveterate enemy of trees may be classed among the vulgar errors that die hard or possess an unblessed immortality. Architects of to-day are fully aware of the effective value of trees in rendering buildings and estates attractive. The Garden City idea has taken firm root, and is extending many branches, and no modern builder can afford to ignore so obvious an indication of the trend of popular taste. His chief difficulty is to know how to get variety in contour and foliage without planting such trees as cannot endure the atmosphere of towns. A correspondence on the subject that is taking place in the "Times" seems to show that, as regards London, the choice is limited to about four kinds—the Oriental plane, the ailanthus, the robinia, and the poplar. Others, such as the catalpa, the tulip tree, and the acacia, are suggested, but their ability to thrive in streets paved with asphalt or creosoted wood, and to resist the noxious gases that poison the atmosphere around them and the earth beneath them, remains to be proved. But, at all events, let it no longer be said that the builder's one idea about trees is to cut them down.

Road Reform and its Building Interest.

Since the announcement was made that an International Roads Congress is to be held in Paris in October, the subject has received a great deal of attention in the public press. So far, the correspondence has not strikingly vindicated the truth of the proverb that in the multitude of counsellors there is wisdom, most of the criticism being purely destructive. The one established conclusion is that "something must be done" to supersede the obsolete methods of Telford and Macadam, to say nothing of the redoubtable General Wade, who was probably the only roadmaker who ever inspired poetic utterance—"If you had seen this road before it was made, You would lift up your hands and bless General Wade." Local authorities in this country are alarmed and incensed at the rapid and enormous increase in the cost of road maintenance since the develop-

ment of motor traffic, and their demand for some equitable scheme for pooling the expenses gathers force with every report upon the condition of the highways. The French roads, once the pride and joy of the country and the admiration of Europe, seem to have got into a more parlous state than our own, the old Roman model upon which they are said to have been formed having failed to anticipate the advent of so deadly an engine of destruction as the modern automobile—the racing motor with armoured tyres, tearing up the roads at terrific speed, or the lorry that pulverises them with its tremendous tonnage of build and burden. Nor is this exclusively a question of making, marring, and mending roads. Building interests are suffering. The sometime pleasant suburban highway or roadside residences are shaken to their foundations by the lumbering motor traffic, and the dust raised by the swift and frequent car renders the exterior of the house unsightly, and the interior almost uninhabitable. To tar the roads is only to substitute one evil for another. It may help the householder to keep the road out of his house in the form of dust; but if he is compelled to bring it inside in the form of tar (which is more difficult than dust to deposit on the doormat), the gain, though only too palpable, is nevertheless of doubtful value; and tar rises up to the destruction of his trees and shrubs. Out of this situation there may arise the necessity for building dust-resisting and smell-repelling houses, with deafened walls and windows, and anti-vibration construction throughout, from foundation to chimney-stack. These considerations should not be overlooked at the forthcoming congress, which may possibly produce some mighty Colossus of Roads, capable of dealing comprehensively and conclusively with every factor of the rather complex problem.

THE GATEWAY, PEEL CASTLE, ISLE OF MAN. (*From a water-colour by M. H. Baillie Scott.*)

Concerning this drawing Mr. Scott says: "It was chiefly interesting to me as showing what beauty can be achieved in building by mere masonry without any architectural features. The prevalent colouring of the stone is red of varying shades, but interspersed with this there are tones of yellow and grey. The shaft of light from the setting sun which suddenly appeared as I was sketching, and which I am afraid appears somewhat too substantial in the drawing, in its warm golden tone presented a marked contrast to the cold blue of the top lighting above the arch. Perhaps no better example could be given to show the futility of mere 'paper' architecture. Building, after all, is mainly an arrangement of materials, and here it is the mason who has been the artist."

A GIANT OF THE RENAISSANCE.

"When I thought I was learning to live I was learning to die." Thus, at the end of his career, wrote that versatile genius Leonardo da Vinci, who, by virtue of his extraordinary intellectual attainments, obtained fame in such varied pursuits as architecture, sculpture, engineering, mathematical science, music, and, above all, painting. In this gifted artist great imaginative power was conjoined with a remarkable facility of execution, and the diversity, strength, and universality of his mental capacities were little short of marvellous; indeed, it is recorded of Leonardo da Vinci that however difficult the subject to which he turned his mind he easily made himself master of it. Unfortunately, the ease with which he acquired knowledge produced the usual result. He attempted too much, and the tasks he set himself to perform were often too arduous and manifold to be brought to a successful conclusion within the brief span allotted to human life.

The Diversity of Genius.

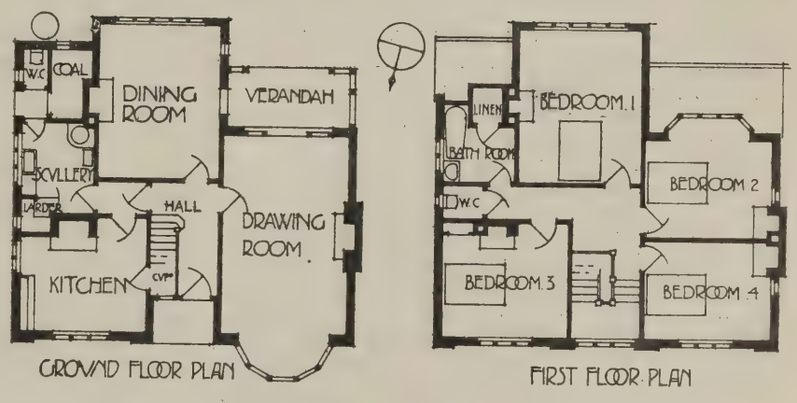
It is true the comparatively few works of art he was able to complete were almost unrivalled in excellence by those of his great contemporaries or their successors, and that the authenticated records of his useful inventions and projects prove him to have been, as a practical scientist, one who was far in advance of his times. Nevertheless, owing perhaps in some measure to a lack of the power of concentration, the immense reputation of Leonardo da Vinci rests less upon the actual productions of his busy life than on the brilliancy of the inventive genius that enabled him to foreshadow and suggest many advancements in the scientific knowledge of his age which were not fully matured and realised until many years—in some cases centuries—after his death. For instance, he spent much time in experimenting with flying machines, and there is a note in one of his manuscripts in which he states his conviction that some day boats would be propelled through the agency of steam. His brain was full of daring architectural and engineering projects. He planned to raise the Baptistery of San Giovanni at Florence by lifting it bodily from its foundations and planting it on a base of marble, and he made drawings for an immense canal to connect the Loire with the Saône. He brought his insatiable spirit of inquiry to bear upon physiology, geology, botany, optics, and astronomy. Everything that offered food for experiment and research appealed to his craving for knowledge.

Leonardo is said to have been the first man of his time to draw attention to the study of anatomy, and to the structural classification of plants. He invented the camera obscura and a saw of the type still in use in the marble quarries of Carrara. His numerous designs for engines of war, and his investigations and researches into the composition of explosives were the wonder and admiration of his country, and it has been well said by an eminent writer that "the discoveries which he made wholesale were destined to be rediscovered piecemeal by men of narrower genius who came after him." His prolific brain was always at work, but through all his scientific pursuits, through all the successive developments of his mind, the ramifications of his trend of thought, the love of art was ever paramount. Hundreds of his drawings are

still in existence, cherished records of his artistic worth, some merely sketches made not as the necessary prelude to more finished productions, but because, through force of habit, drawing had become a part of his daily life. Ever a close observer and lover of Nature, Leonardo had far less regard for antique models than the majority of his contemporaries. His system of inspiration was one peculiar to himself. Strange fantastic shapes, abnormal forms, grotesque expressions, were for ever being memorised or graphically noted by this indefatigable artist.

Strangely enough, in his application for employment to the Court of Ludovico il Moro, at Milan, Leonardo rests his own claims to patronage mainly upon his attainments in military engineering, to which, in a still extant letter to the Duke, he refers at length under nine different heads. In the tenth he states that he can construct bridges which are "very light, strong, and portable," but his references to the fine arts are brief. They include statements to the effect that the applicant can execute sculpture "in marble, bronze, or clay," and "in painting do as much as anybody else."

Leonardo's Great Painting.

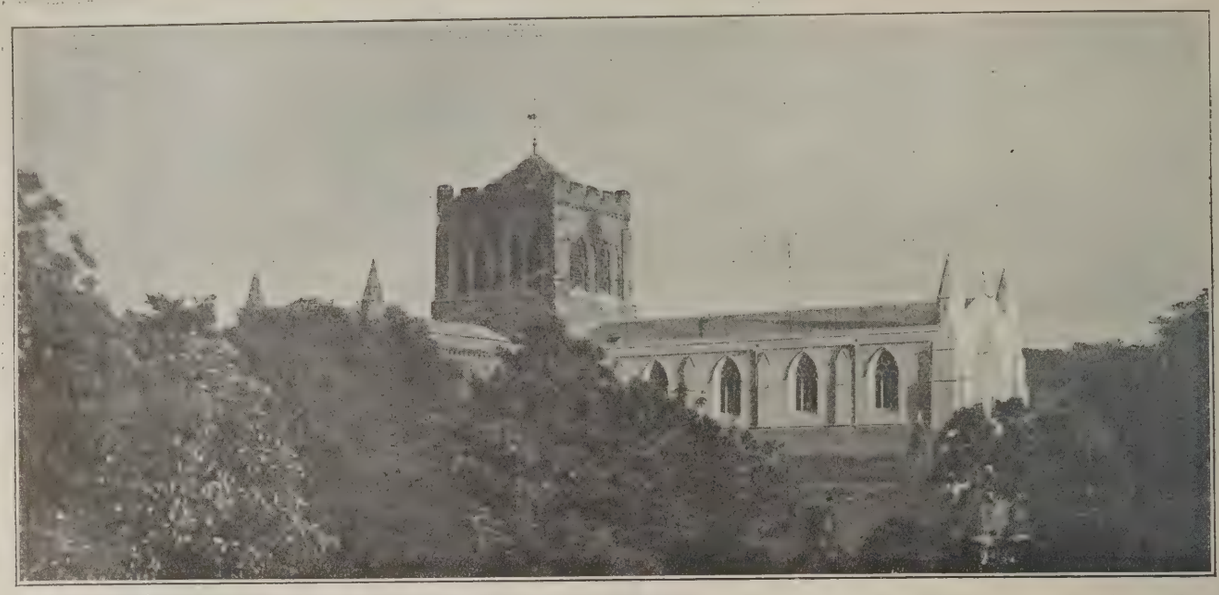


During the many years he spent at the Court of Milan the free exercise of the artist's manifold capacities was displayed in such diverse duties as the construction of military engines, works of irrigation and other schemes of a practical nature, and, in addition, in the preparation of a design for a dome at the cathedral, and the general control of the arrangements connected with the production of the court pageants and masques. During this period of his career he modelled the colossal equestrian statue of Francesco Sforza, which, according to some authorities, was never cast in bronze, although others assert that it was completed and set up in 1493, but destroyed by the army of Louis XII. a few years later. Equally disastrous was the fate which overtook another splendid work executed by Leonardo—the great mural painting of the Last Supper, which ranks as one of the most celebrated pictures of the world. This large fresco, painted on the wall of the refectory of the Convent of Santa Maria delle Grazie, has suffered terribly, partially from the ravages of time, and partially from successive attempts to restore it to its original beauty; yet, even in its mutilated condition, we feel with Goethe that "the painter rose to the height of his argument and realised worthily and for good this momentous scene in the spiritual history of mankind."

After leaving Milan, on the overthrow of his patron, Leonardo resided for some time at Florence, from which town an envoy, sent by the Marchioness of Mantua, with instructions to endeavour to attach Leonardo to her service, wrote respecting the artist as follows:—"He is entirely wrapped up in geometry, and has no patience for painting. Since he has been in Florence he has worked only on one cartoon."

Later, he entered the service of Cæsar Borgia, for whom, in the capacity of engineer, he seems to have mapped out nearly the whole territory of Tuscany and the Maremma between the Apennines and the Tyrrhenean Sea. Then, in 1503 he was once more in Florence busy on a commission for a historical painting to adorn the walls of the Palace of the Signory to correspond with one to be painted by Michael Angelo. Leonardo chose as his subject an episode in the victory of the republic over Picciuino, at Anghiari, and the immense cartoon, which depicted the episode of the fierce struggle for the colours between the opposing forces, and was therefore sometimes called the Battle of the Standard, was exhibited in company with the companion cartoon of his brother artist, and the two works received the highest commendation on all sides. The actual painting was commenced by Leonardo, but the technical method employed by the artist proved defective, and the work was ultimately abandoned by him, and, before long, the unfinished painting disappeared altogether from the wall, while the much-admired cartoon has, unfortunately, also perished.

In his sixty-fourth year Leonardo was prevailed upon by Francis I. to enter his service, but the strenuous life of the great artist was drawing to its close, and beyond the fact that he is known to have painted two pictures, which have since been lost, and to have prepared a scheme for some large canals, very little is known of the work upon which he was engaged in France, although it is evident, if reliance can be placed upon the words of Benvenuto Cellini, that Leonardo succeeded in gaining the respect and esteem of his royal patron.



COTTAGE AT ELSTREE, HERTS. EDWIN GUNN, A.R.I.B.A., ARCHITECT.

This cottage, in accordance with the wish of the client, provides a drawing-room very large in proportion to the size of the house, and commanding views both to front and rear. The materials are intended to be red sandfaced bricks of varied colour, with wide mortar joints, and with thick red sandfaced tiles for roofs. The joinery will be deal, painted white. A lead gutter and rainwater heads will be used on the road front, together with some plaster panels having slightly modelled enrichments. The architect is Mr. Edwin Gunn, A.R.I.B.A.

THE R.I.B.A., THE ROYAL INSTITUTE OF IRELAND AND THE ULSTER SOCIETY.

In our issue of July 29th we gave an extract from our contemporary, "The Irish Builder," commenting on the dispute between the R.I.B.A., The Royal Institute of Ireland, and the Ulster Society of Architects. Mr. N. Fitzsimons, F.R.I.B.A., hon. secretary of the Ulster Society, has replied to this comment in a vigorous letter, for which he asks publicity, and in which he states that "The character and constitution of the Royal Institute of British Architects has been falsified, its relation to the Royal Institute of the Architects of Ireland misdescribed, and the history of the initiation of The Ulster Society, with its subsequent action, travestied." Pressure on our space prevents us from publishing in full the letter, which is very long, but we propose to give the salient paragraphs in our next issue. It is a very pretty quarrel, which appears to turn mainly on the interpretation of the actual relationship subsisting between the two Royal Institutes; and on this point the Ulster Society is entitled to be heard. Our desire for fair play all round is our only reason for making further reference to the controversy.

THE NEW NAVE, HEXHAM ABBEY, TEMPLE MOORE, F.R.I.B.A., ARCHITECT. *Photo: Gibson.*

NEW NAVE AT HEXHAM ABBEY.

The Screen Controversy.

As duly recorded under "Notes and News," in our issue of August 19th, the new nave of Hexham Abbey was consecrated on August 8th. About £30,000 has been spent on this and other works of restoration, which have been carried out under the supervision of Mr. Temple Moore, F.R.I.B.A., with whom Mr. C. C. Hodges was associated as resident architect. The new work is well represented in the accompanying views.

Of course, the customary controversy has occurred as to the manner in which the restoration has been conceived and executed. It was hardly imaginable that the self-appointed champions of antiquity would forego so glorious an opportunity as the restoration of a building so venerable, and in other ways so remarkable, as Hexham Abbey, and, after all, it is quite surprising that they have made so little fuss about it.

The fine old priory church of Hexham was begun by Wilfrid in 674, and completed by Acca, his successor. In 875, all but the stonework was destroyed by the Danes. The stones of which it is built had been apparently used in earlier work, many of them bearing Roman inscriptions. In the twelfth century the buildings consisted of nave and transepts, choir and aisles, and a massive central tower. In 1296 the Scots burned the nave, which until now had never been rebuilt. The style is Early English, with Transition details, and the crypt, discovered in 1726, is a fine example of Saxon architecture, of which there are also traces in the choir.

Messrs. Temple Moore and Hodges were fully aware that in undertaking so delicate a task as that of restoring so venerable a building they were exposing themselves to inevitable attack, and they were probably by no means surprised to find Mr. Aymer Vallance making his moan in the columns of the "Times." They may congratulate themselves on being let off so lightly. Mr. Vallance is not concerned about the building of the new nave, nor has he "anything but heartfelt praise for such necessary works of repair as have been carried out for strengthening and preserving the central tower and north transept front." His great grievance is that "the restorers, not content with these achievements, have laid ruthless hands on the great organ-screen or pulpitum, which dates from about 1500. Now," Mr. Vallance continues, "whereas in every other instance extant of a cathedral or monastic pulpitum—*e.g.*, at Canterbury, York, Westminster, Lincoln, Wells, Exeter, Rochester, St. David's, Ripon, Christchurch, Glasgow, and Melrose—the material is stone, the pulpitum at Hexham Abbey is the solitary example remaining in timber. As such, therefore, it is literally unique. Its plan is that of two parallel wooden walls, pierced by a transverse passage, and having on the south a stone staircase between the walls, conducting through the floor of the platform on to the top. The westward front is panelled with solid panels of elaborate Flamboyant tracerywork. But those in office voted the pulpitum an obstruction, and, on the suggestion of Mr. Temple Moore, decided, without a moment's hesitation, to mutilate it by converting the fixed panels into shutters."

Mr. Vallance reminds us that the architects' report, dated April 26th, 1907, contains the following passage bearing on the point:—

"The opening of the side panels of the choir-screen above the transome level is necessary, in order that the congregation may, so far as possible, see into the choir from the nave. The eastern modern panels will be removed entirely, and the rich western panels be made to open as occasion requires. This work also necessitates the removal from the interior of the screen of the rough timber framing put there to support the weight of the organ, and also the strengthening of the ancient pillars and floor of the loft over, to allow of this timber trussing being removed. Certain items of restoration and finishing will also be needed to the interior of the screen, and some alteration may be found necessary to the 15th century spiral stair to the organ loft."

Mr. Vallance declares, in his wrath, that "the avowed motive of all this is nothing else than the same fatuous letch for vistas, the pandering to which has permanently spoiled the interiors of, for example, Durham, Salisbury, Ely, Chester, Worcester, Lichfield, Chichester, Peterborough, and Bangor. At Hexham the eastward panels, if not original, undoubtedly represented the original arrangement, and replaced the solid woodwork removed at the time when the canopies of the return stalls, backing against the pulpitum, were destroyed. These panels have now been taken away bodily. On the westward side of the pulpitum the two tracery panels flanking the entrance have been sawn through all round the edge and made to swing on hinges; while the two others, the end panels, have been cut vertically down the middle and the loosened half of each one hinged. It is a mercy that that portion of the piers which prevents these two panels from swinging open in their entirety was spared! The medieval stone stair, however, has not undergone 'some alteration,' as hinted at in the official report, represented in the official plan, and as sanctioned—so one would presume—by faculty. It has been totally demolished, and a new feature introduced. This is an iron spiral staircase—a hideous eyesore, resembling a fire-escape on the outside of a block of model dwellings!—set up in the north quire ambulatory. To make a way from it on to the loft at this point the north-east portion of the parapet has been cut open."

But Mr. Vallance has hardly made sufficient allowance for the difficulties of the problem that the architects were called upon to solve. The screen about which he raises his doleful lamentation had to be modified or removed. For many years only the chancel has been used for public worship. The screen, if left in position unaltered, would have cut off the new nave from the choir and chancel. The architects thought that the removal of the screen would be an act of vandalism. They therefore decided to make it, as far as possible, an open screen, "partly by taking off the range of picture panels which were fixed above the west front of the loft, and which did not belong to it and placing them in a better position and by hingeing the main panels above the transome on the west side so as to open inwards, or towards the east, to allow a clear view through the screen

during the time of service." At other times the panels can be kept closed, so as to present their original appearance. It is an ingenious and a rather daring device, and its failure to meet with the approbation of the enthusiastic archæologist was a foregone conclusion; but its cleverness will make an irresistible appeal to the mind of the average natural man. The screen is believed to have been erected during the priorate of Thomas Smithson, before 1525. It probably underwent considerable alteration to admit of the building of a new organ in 1856, and plain pine panels were inserted on the eastern side as late as 1860. These, of course, have now been removed.

Dean Fremantle, of Ripon, in the course of a brief but vigorous reply to Mr. Vallance, retorts that: "Surely the duty of an architect in dealing with a church which represents a different phase of Christian worship from our own is not to reproduce servilely the ancient model, but to adapt it to the truer ideas of our own church system. . . We want, for our sacred buildings, architects who will not merely copy the peculiarities of the unreformed system, but who, with equal boldness and reverence, will make these ancient buildings suit the principles and needs of the present day." He means that Hexham Abbey is no longer a monastic institution, in which, to quote the words of yet another of Mr. Vallance's opponents, "the chancel was sufficient for the choir offices, and the transept could be used for low masses. It is now the parish church of a populous and increasing town, and even with the new nave is not too large for the Sunday congregation, so the choir must be in touch with the people, and the panels of the screen must be opened." Sheer utility, therefore, and not what Mr. Vallance curiously stigmatised as "a letch for vistas," was the controlling influence in deciding upon an alteration that seems to have scandalised hardly anybody but that distinguished and uncompromising archæologist.

Mr. Vallance's reply, published on Monday last, challenges the Dean's assertion that screens are necessarily associated with "a different phase of Christian worship from our own." There is, Mr. Vallance points out, a continuous tradition of screen-building in Protestant England down to within quite recent times. . . . A pulpitum was erected by Bishop Cosin, at Durham; at Salisbury, by Wyatt, in place of one which he destroyed; and at Oxford by a Dean of Christ Church, in the seventeenth century." He declares that a cathedral "has nothing to do with any peculiar form of Christianity, reformed or unreformed, false or true," and reverts to his rather archaically expressed scorn of "a letch for vistas."

THE NEW NAVE, HEXHAM ABBEY. TEMPLE MOORE, F.R.I.B.A., ARCHITECT.
Showing the old screen or pulpitum over which a controversy has arisen.

Proposed New Works.

Blackburn Corporation have approved a scheme for the utilisation of a large area in the centre of the town, cleared several years ago of insanitary property, at a cost of about £80,000. They propose to erect thereon a police station, sessions and borough magistrates' courts, a public hall (to seat 3,500 people), and two other assembly halls. A proposal to erect also new county courts has been negatived by the Treasury.

A report on the damage to the sea-wall of the Marine Drive, Scarborough, caused by recurring storms and the washing away of the shale at the toe of the wall, has been under consideration by a committee of the Scarborough Town Council, who have decided to obtain alternative tenders (1) for the sinking of caissons in front of the damaged portion of the wall, with an apron of rough boulders between the caissons, and (2) for the construction of a toe in front of the portion referred to. In order to provide the necessary funds for carrying out the above, the Town Clerk has been instructed to obtain a provisional order empowering the Corporation to borrow an additional £12,000. It was decided to deal only with the damaged portion of the wall at present.

A Local Government Board inquiry has been held by Mr. W. O. E. Meade-King, M.I.C.E., relative to an application by the Devizes Town Council for permission to borrow £850 for the purpose of laying in a new sewer to serve a building area recently developed within the borough border, and known as Forty Acres.

Mr. W. A. Ducat, Local Government Board inspector, has held an inquiry into an application of the Manchester City Council for sanction to borrow £1,500 for the purchase of land adjoining Cheetham Baths for the purpose of extension.

St. Benet's, Kentish Town, which is quite a modern structure, was unluckily built on "made" ground, and, as a result, there are sunken aisles, split chancel, and cracked walls. The church has been condemned by the London County Council as a dangerous structure, and the repairs for which Canon Scott Holland is appealing will cost at least £4,000.

As a result of the development of the Warwickshire coalfield on the Earl of Craven's Coombe Abbey estate, there is an important scheme on foot for the erection of about 2,000 houses at Wyken. About six miles of streets will be laid out.

Basford's new baths, which have been built in Vernon Road, close to Basford (Notts) station of the Great Northern Railway, comprise a swimming bath 70ft. long by 28ft. wide, four small washing baths for men, four slipper baths for women, and eight slipper baths for men. The total cost is stated at £7,500. The building was designed by Mr. F. B. Lewis, the city architect.

A new pier for Whitley Bay, Newcastle-upon-Tyne, is to be built for a syndicate with a capital of £35,000, and provisional contracts were awarded to the Cleveland Bridge and Engineering Company, Darlington, for carrying out the work to the designs of Mr. T. Brewer-Mather, of Wallsend-on-Tyne. The pier, which will be the only one of the kind on the Northumbrian coast, is expected to be completed early next summer. It will have a total length of 772ft., and in addition to the usual promenades, bandstands,

and tea-rooms it will have in its centre a pavilion (with a garden roof), capable of seating 1,800 people. At the end of the pier there will be a landing stage for the accommodation of pleasure steamers and small craft.

Plans presented on August 25th for the approval of Eastbourne Rural Council included those for the erection of two pairs of houses in Brassey Avenue for the Eastbourne Artisans' Dwellings Company (Mitchell and Ford, architects); two houses in Rosebery Avenue (A. Chandler, architect); and five houses in Huggett's Lane, Willingdon (A. H. Burtenshaw, architect).

A site has been acquired for a proposed new Liberal club-house at Tilbury.

A site has been found in Deansgate for a proposed church house for the Diocese of Manchester. To provide the necessary capital, it is proposed to form a company, with a capital of £40,000.

The widening of the Great Western Railway at North Kensington will necessitate the demolition of nearly 100 houses, and the company has purchased in Southern Street and St. Ervan's Road 138 houses, and will build others, in which to house the population displaced by the extension of the line. Altogether, accommodation will be provided for about 2,000 persons.

The Improvement Committee of Nottingham City Council have recommended several street widenings, and other improvements, upon which the capital outlay is estimated at £4,225. These operations will be followed by the rebuilding of several important business blocks, including the Sun Fire Office premises.

Nuneaton improvements that are under consideration by the town council refer mainly to the widening of the approaches to the centre of the town. The cost is estimated to reach at least £8,000. Building developments in the suburb of Stockingford are also in contemplation; a large estate there is about to be plotted for the erection of dwellings.

A reredos for All Saints', Falmouth, is to be erected at a cost of about £350.

The "Largest Office Building in the World" is to be erected, of course, in New York. The premises will cover an area of 52,000 square ft., and the building will be thirty-five storeys in height. The site chosen for this gigantic skyscraper is close to the Battery, and the cost will be more than four million dollars. The building is being constructed for Mr. Chesebrough, of vaseline fame.

A new church for Newquay is proposed at an estimated cost of £10,000.

Owing to the growth of the telephone department of the Post Office, the Postmaster-General has decided to allot the whole of the buildings in Queen Victoria Street, London, to its use, and to move the money order department, which at present shares this accommodation. New offices for the latter are to be erected in Manor Gardens, Holloway, and these are to be ready by July, 1911, although the site has yet to be cleared.

The Blackburn Corporation propose to commence building operations on the Blakey Moor site, which has been cleared of slums at a cost of £80,000. The buildings contemplated include a public hall to seat 3,500 people, a quarter-sessions court, a police court, and a police station. On another part of the site a higher elementary school is to be erected.

Works in Progress or Recently Completed.

The new nurses' home and extensions at the City Hospital for Infectious Diseases, at Walker Gate, Newcastle, have been erected at a cost of nearly £50,000. The architect is Mr. Holford, the city surveyor, and the contractors are Messrs. J. Parkinson and Sons, Ltd.

Wickwar Church bells have been recast and rehung on a new steel frame, at a cost of about £300, by Messrs. Gillett and Johnston, of Croydon.

Bradford Town Hall extension is now nearly completed, the roof being on, and the electricians and other indoor workers being in possession. Mr. F. E. P. Edwards is the architect, and Messrs. Michael Booth and Sons are the contractors.

A fourteenth-century church house, or tithe-barn, at Poundstock, in the north of Cornwall, has been restored at the cost of £400. Care has been taken to preserve some fine old woodwork, including portions of the old oak-mullioned window-frames, and the heavy oak door of an ancient reception room.

Alterations to the Metropolitan Music-hall, Edgware Road, N.W., include an extension of the Mansfield stone elevation, into which gold and coloured mosaics have been introduced, enlargement of the auditorium and the vestibule, redecoration of the interior, and improved ventilation, lighting, and sanitation. Messrs. Frank Matcham and Co., who designed the hall in 1897, were architects for the work.

Truro Cathedral Progress. — The lower stages of the two western towers of Truro Cathedral were in 1903 carried to the ridge of the roof of the nave, and contain the internal vaulting. The total cost of the remaining stages of the towers and the spire is estimated at £16,500. A further sum of £3,500 will be used towards the erection of a cathedral school. The plans and designs for the west towers and spires are, with slight modification, those of the late Mr. John L. Pearson, R.A., architect of Truro Cathedral, and are being carried out by Mr. Frank L. Pearson, his son, architect to the Dean and Chapter of Truro. The contractors are Messrs. Willcock, of Wolverhampton. The clerk of the works is Mr. E. T. Price, who acted in the same capacity during the erection of the nave and central tower, which also was built by Messrs. Willcock. Mr. F. L. Pearson has designed the school. A design somewhat enlarged, and thus improved from an incomplete design of Mr. John L. Pearson, has been made for an octagonal chapter-house at the north-east of the cathedral, and also for a fine cloister court. Over the east walk of the cloisters is a library and song school, and some diocesan offices may possibly be added. The cost of entirely completing these buildings may be estimated at about £22,000. A peal of ten bells has been promised by various donors for the north-west tower, and the bells are being cast by Messrs. J. Taylor and Sons, of Loughborough.

A new stained glass window that has been inserted in the south side of the chancel in Stoke Church, Coventry, by Messrs. Heaton, Butler, and Bayne, of Covent Garden, London, consists of two lights, and has for its subject the Supper at Emmaus. Christ is depicted in the right-hand light, and the two disciples in the left-hand light. The tracery contains an angel holding a scroll, on which is the word "Alleluia."

A brass memorial tablet has been erected in the chapel at the Royal Naval College, Osborne, in memory of the late Mr. W. G. Grace (son of Dr. W. G. Grace, the famous cricketer), who died at the College three years ago.

The new cathedral at Pretoria, upon which work is now in progress, will possess interesting local features. For thirty years Pretoria has possessed a cathedral of sorts—a structure rather like a barn, of red brick without and plaster within, with an iron roof. The architect of the new cathedral, Mr. Herbert Baker, of the firm of Baker and Masey, who himself lives on the veldt, maintains that "a country should have no merely imitative architecture, but one fitted to its climate, scenery, atmosphere, and material." His design for the cathedral is very simple — that of a long apsidal church, with a dome visible only inside, roofed with red tiles, and with a high campanile; the material a rough stone from the district.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Oct. 7	BOAT SHELTER, INVERNESS. Engineers invited to submit plans for a scheme, not exceeding, in cost, the sum of £10,000. Conditions from Kenneth Macdonald, Clerk to the Harbour Trustees, Town House, Inverness.
Oct. 31	*COUNTY HIGH SCHOOL FOR GIRLS, ROMFORD.—Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.

** This competition has been unfavourably reported upon by a Correspondent.*

A Typical French Competition.

A new Marine Service building is to be erected in the Avenue de Suffren, Paris. French architects only are invited to send in competitive designs, and those intending to compete must communicate with the Minister of Marine before October 1. British architects will no doubt be interested in noting this typical instance of the manner in which "these things are done in France." The designs are to be publicly exhibited on December 1st. The jury to whom the designs will be submitted will consist of the Inspector-General of Maritime Works, who will of course be the president, and of six others, of whom two will be elected by the competitors, two will be architects nominated by the Under-Secretary of State for the Beaux-Arts, and two will be maritime engineers. The premiums are as follows:—First, 8,000 francs; second, 5,000 francs; third, 3,000 francs. A further sum of 10,000 francs may be apportioned as the jury may see fit among the other competitors who are classed. Probably the author of the design placed first will be invited to supervise the work of construction.

FINISHING VERGES AND GABLE ENDS.

By Edwin Gunn, A.R.I.B.A.

The detailed finish of tiled or slated roofs next verges and gables, is a matter of considerable importance, both from a purely practical point of view, in relation to durability; and also as affecting the appearance of a building. The accompanying illustrations show various sound and simple methods of gable finish, and may prove a useful supplement to the scanty information which is usually obtainable by examining text-books of construction.

The Close Verge.

Fig. 1 shows the close verge, which represents the simplest treatment of all, and one which, when properly carried out, is always satisfactory. The end rafter next the gable should in all cases be fixed with its back about 1 in. higher than the general plane of the roof, to produce a tilt of the roof-covering away from the verge, a sprocket being nailed to the gable end of the ridge board to give that member a corresponding rise. The brickwork is cut to the same line, and on this a course of tiles or slates is laid flat and butting, bedded in cement and projecting 3 in. The roof-boarding or battening is extended as shown, and the end tiles or slates are bedded in cement, in addition to being nailed. Tile-and-half should, of course, be laid next the gable in each alternate course, or wider slates in a slated roof. The verge is afterwards well pointed up with cement or lime and hair, to finish with a flush face between the soffit and roofing tiles. For some inscrutable reason, builders (and some architects) are very fond of reddening this verge, either with colouring matter, or by rubbing in brickdust; but it looks best if left uncoloured—that is, showing the natural colour of the pointing and tiles. The latter, however, are apt to become smeared with cement, but can be cleaned off with water and a stiff brush before the pointing has set quite hard.

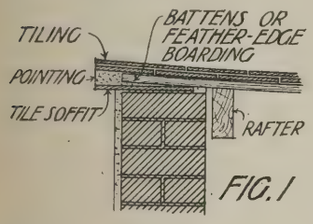

FIG. 1

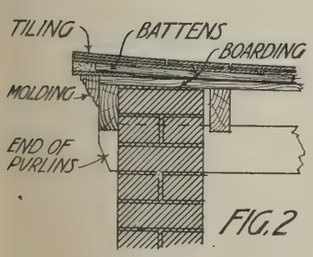

FIG. 2

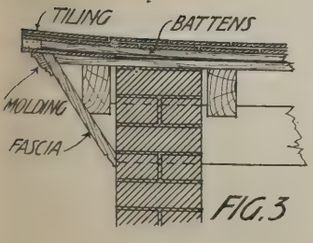

FIG. 3

VARIOUS TREATMENTS OF TILE & SLATE VERGES

The Flat Tile Soffit,

which is shown in all the illustrations, has the practical value of holding the pointing, which is apt to drop out when the roofing tiles alone project over the wall. It is also possible to project this thick verge further than the thin skeleton affair which the latter arrangement gives. Another advantage of the flat soffit is apparent when wood mouldings are fitted below the verge (as in Figs. 2, 3, and 4), as they fit easily without the necessity of scribing to a jagged line. Fig. 2 shows a simple treatment, with verge rafter supported on ends of wall plate and purlins. The amount of projection may be greater, but should, of course, be proportioned to the scale of the building. The soffit tiles, where they rest on wood, as in this case, should be nailed instead of being bedded. Fig. 3 shows a plain moulded fascia, covering the verge rafter, which is an effective treatment when well proportioned. Fig. 4 gives a section through a barge-board, and calls for little comment, save to enter a protest against the frequent practice of lining the exposed soffit of rafters with wrought V-jointed boarding. It is much better to let the soffit of roof-boarding or battens remain exposed, as seems always to have been done in old work.

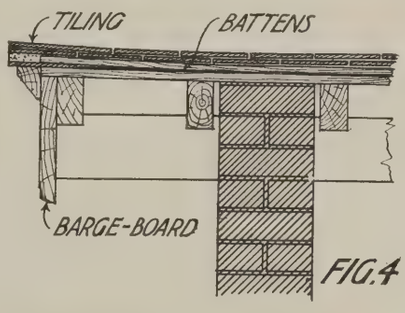

FIG. 4

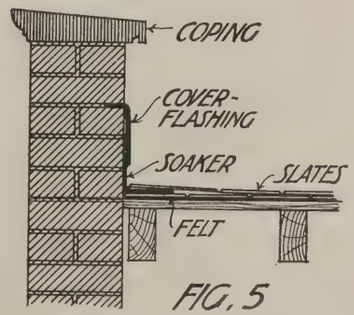

FIG. 5

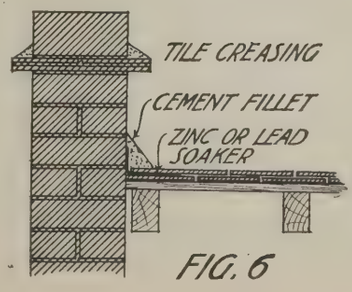

FIG. 6

Gable Treatment with Parapet Walls.

Figs. 5 and 6 show two gable treatments with parapet walls. Flashings, which are shown in all text-books, and are frequently carried out, are not only ugly in appearance and expensive, but in dressing the lead down over tiles and slates these latter are very likely to be fractured.

Soakers and Cover Flashing.

Fig. 5 shows a slated roof with soakers and cover-flashing—a much better arrangement. The soakers lie 5 in. on roof, and stand up 5 in. vertically; their length should be equal to gauge the lap. As the soakers are out of harm's way, 4-lb. lead is sufficient, and, being thinner also, lie better between the slates; but the stepped cover-flashing should be 5-lb. or 6-lb.

Soakers and Cement Filleting.

Fig. 6, showing soakers and cement filleting, is unsatisfactory for slated roofs, owing to the non-absorbency of slate giving no hold to the cement; but for tile roofs this is quite a good treatment for all ordinary purposes. The use of zinc in soakers is not open to the usual disadvantages, as the metal is protected from damage, but thin lead is, of course, better. Soakers for use with cement filleting stand up 2 in. only. The coarse effect of plain filleting may be obviated by forming a succession of nicks with the point of a trowel, or some other angular object (this is always done in old work), which also helps to consolidate and bind the cement.

Obituary.

Sir Eyre Massey Shaw, who died at Folkestone on August 25th, aged 78, was virtually the founder of the Metropolitan Fire Brigade. In the Tooley Street fire of 1861, which caused the destruction of property worth £1,300,000, James Braidwood, chief of the London Fire Engine Establishment, was killed, and Eyre Massey Shaw, who, as chief constable of Belfast, was also superintendent of the fire brigade, became his successor. In consequence of this great fire, the duty of protecting property was transferred to the Metropolitan Board of Works, an Act of Parliament to this effect being passed in 1865, and upon Captain Shaw devolved most of the task of the thorough reorganisation of the service. He remained at the head of the brigade until 1891, when he was created a K.C.B. He wrote a manual on "Fire Protection"; a work on "Fires in Theatres," in which he insisted on the desirability of public authorities requiring a report from their architect or surveyor as to the exits; "Fire Surveys: a summary of the principles to be observed in estimating the risk of buildings"; "Records of the late London Fire Establishment"; and an essay on "Fires and Fire Brigades," in the International Health Exhibition Handbooks. He was born on January 17th, 1830, at Ballymore, County Cork.

* * *

Sir George Barclay Bruce, who died at St. John's Wood on August 25th, was an eminent engineer who had constructed several railways, notably that of Madras, which, opened in 1857, included the building of a fine bridge near Trichinopoly. Born at Newcastle-on-Tyne on October 1st, 1821, he was in 1887 elected president of the Institute of Civil Engineers, and was knighted in 1888.

Law Cases.

Breach of a Building Covenant.

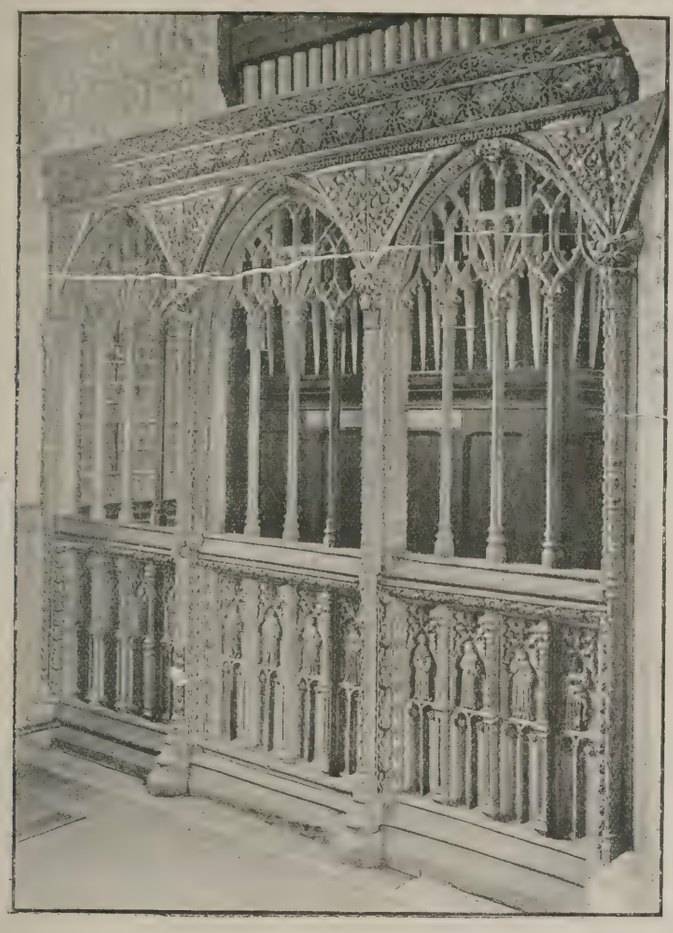
In the Chancery Division, on August 26th, the case of *White and Others* v. *Pollard* was a motion for an injunction to restrain the defendant until the trial of the action or further order—(1) from erecting upon a plot of land forming part of a certain building estate, any buildings adapted for use as or in connection with a place of business, or any buildings other than buildings adapted for private residence purposes, only; and (2) from using any buildings erected or to be erected on this plot as or in connection with a place of business or otherwise than as and for private residential purposes only, in breach of restrictive stipulations to which the said building estate was subject. It appeared that the defendant was erecting stables on a certain plot of land in Shearbridge Road, Bradford, of which he was the owner, and that he was bound by covenant not to "use or suffer to be used any building which might be erected upon any part or parts of the said plot of land as an hotel, tavern, public-house, beer-house, or shop, warehouse or manufacturing dyehouse, chandler's shop, or other place of business." Plaintiff stated that the stables in question consisted of four stands and a loose-box, and that the defendant had stated to several persons that he intended to use them for horses employed in his business as a coal merchant. The defendant deposed that he had erected a stable upon this plot of land, but that he did not intend to use it for the purpose of carrying on his business. From affidavits filed on his behalf, it appeared that the plaintiffs had taken no steps against a doctor who used a stable on a neighbouring plot, subject to the same covenant, to house three horses used in his profession, or against a saddler, who used a stable on a similar plot for a horse used in his business. Mr. Bramwell Davis, K.C., contended, on behalf of the defendant, that if the defendant used his stable for horses employed in his business as a coal merchant, that business did not come within the purview of the covenant. The use of the plot for housing the horses he might use in his coal business was not a use of it as a place of business: and the plaintiffs had waived their right to sue for this injunction by not taking action against the doctor and saddler. Mr. Justice Eve said that the defendant had only himself to thank for any ambiguity there might be as to how he intended to use this stable. He found as a fact that the defendant intended to use the stable for the purpose of stabling horses employed in his business as a coal merchant. He thought that a retail coal merchant carried on his business at a number of places—the wharf, the siding, and the place where he kept his horses. It was impossible to say that he was carrying on his business at any one of these places and not at another. He thought the object of the covenant was to protect a residential estate from being used for the purposes of business. As to the point as to waiver, it had long been decided that every trifling breach of a covenant was not to be taken as a waiver. The order, therefore, would be made to restrain the defendant in the terms of the covenant. The costs of the motion would be the costs in the action.

Notification of Workmen's Accidents.

At Marlborough Street Police Court, on August 18th, Messrs. Waring and White, Limited, answered five summonses alleging that they failed to notify to the Government factory inspector of the district certain accidents to employees which occurred at 410, Oxford Street, W., in May and June. Mr. Leonard Ward, inspector of factories, said that the summonses related to accidents to workmen which occurred in the course of their duties in erecting a large building in Oxford Street, the proceedings being taken under the Factory Act, 1901, and the Notices of Accidents Act, 1906. Mr. Thatcher, a factory inspector, in paying a visit to the premises in July, found that fifteen accidents had occurred, and that they were entered on the register, but had not been reported to the district factory inspector. They were, however, reported subsequently. The five in question were selected. Mr. Melville, counsel for the defence, pleaded guilty, and mentioned that the failure to report was quite unintentional, and was the innocent act of a hard-worked official on the works. He could only express great regret on behalf of the firm for the omission. The accidents were not serious, being only bruises and cuts, and in one case a broken wrist. They were reported to the companies in which the men were insured. Mr. Mead imposed a fine of £5, with £5 4s. costs on one summons, and a fine of 10s. on each of the other summonses, without costs, the penalties amounting in all to £12 4s.

Views and Reviews.

Rood Screens in English Churches.



The rood and rood screen, being the most conspicuous features of church interiors, susceptible of very varied decorative treatment, and representing, collectively, many centuries of artistic and religious feeling, have naturally claimed much attention from the makers of books. The "literature" of the subject is sufficiently extensive to warrant Mr. Francis Bond, the author of the present delightful volume, in prefacing it with a "bibliography" that fills two pages, and enumerates about forty works dealing either specifically or incidentally with particular screens, or with screens in general. Mr. Bond's aim is to present the object from the evolutionary point of view. Beginning with the rood and rood beam of the early Christian churches, he follows their gradual development into the chancel screen of the parochial and collegiate churches, or into the quire screen and rood screen of the churches of the monks and regular canons; finally tracing to the transposition of the rood lofts the galleried churches of the seventeenth and eighteenth centuries.

From primitive Christian times, the apse, or sacrarium, where stood the altar, was fenced off with railings of wood or bronze. Sometimes the barrier took the form of a colonnade, where lamps, candlesticks, curtains, or a cross could be suspended. The origin of the rood screen is

ENRICHMENTS ON SCREEN AT KENTON, DEVON.

"In Devon," says Mr. Francis Bond, "the screens were crowded and exuberant with design from top to bottom. Below was panelling with paintings of saints, as at Kenton; or, more rarely, with little figures in wood, as at Bridford" (*see illustration on page 163.*)

SCREEN AT BRIDFORD, DEVON.

Late in the sixteenth century there was a rage for the destruction of rood lofts. "Sometimes," says Mr. Francis Bond, in "Screens and Galleries in English Churches," from which, by courteous permission of the publisher, this and the illustration on the facing page are reproduced, "the coving as well as the loft was removed, and bits of the old coving were used to fill up the spandrels. This explains such awkward [illegible] combinations as one sees in the screen of Bridford, Devon. Note the carved figures.

ingeniously conjectured. "The greater churches of the early Christians," Mr. Bond reminds us, "were all unvaulted, and the nave, and consequently the chancel arch, or Arch of Triumph, was exceedingly broad. A rood beam of wide span, unsupported, would certainly have sagged at the centre. To prevent this, supports would be added, and these supports would naturally take the form of columns, as at Old St. Peter's (Rome). This was to convert the rood beam into a rood screen. Such an erection was at once altar railing and rood screen. Then came a change in church planning. In the earliest churches the apse was attached directly to the nave, and formed a sanctuary, containing the high altar. A quire was also needed, and for the purpose of a quire the western bays of the nave were appropriated. Just as the altar had been fenced off by railings or by a colonnade, so the quire needed to be enclosed and secured from intrusion. This was effected by erecting round it a wall or parapet, which was kept quite low, so as not to block the view of the altar. These quire enclosures usually consisted of thin marble slabs, about 4ft. high. The slabs were sometimes solid, but covered with carved work, especially with interlacings, *e.g.*, at St. Clement's, Rome; frequently they were pierced, as at Torcello. . . . Even so late as the fire of 1174, a low wall, a lineal descendant of the low early Christian parapets, survived in Canterbury Cathedral, on either side of the quire. . . . In St. Maria, in Cosmedin, both arrangements are seen, a colonnade in front of the altar, and a low parapet enclosure round the choir. The next step is to consolidate both these, and to make the combined colonnade and western parapet occupy the position of the western parapet." The subsequent elongation westward of the apse led to further modifications; but the chief point to observe is that in Italy the rood beam with its supports developed into a colonnade; in England, into the quire screen of oak or masonry. Other theories of the origin of the mediæval quire screen that have found favour are summarised by the author, but need not be elaborated here.

Although the origin of screens appears to have been utilitarian, their artistic value seems to have been immediately perceived. It was perhaps recognised that, as the author says, "nothing adds so much to that most potent of all effects in church architecture, 'mystery,' as a screen, with its vistas half-hidden, half-revealed, of beautiful and holy things beyond . . . nor does anything add so much to the apparent length of a church as to break it up with a screen."

The four chapters into which the book is divided deal, respectively, with (1) origin of screens, (2) chancel screens and galleries in parish churches, (3) quire screens in cathedrals and collegiate churches, and (4) quire screens and rood screens in churches of monks and regular canons. The fourth chapter comprises also a most interesting series of measured drawings, an "Index Locorum," and an "Index Rerum."

The 140 or so photo-process engravings include many examples of beautiful carving, and the author may be congratulated on the production of a book that, in text as well as in illustrations, is of striking and inexhaustible interest. It is exactly the kind of book to which one returns again and again, in the assurance of renewed and increased pleasure at each re-perusal.

For permission to reproduce the illustration of the enriched screen at Kenton, shown on p. 162, and the screen at Bridford appearing on this page, we are indebted to the courtesy of the publisher.

DETERIORATION OF FRENCH ROADS LARGE RE-METALLING SCHEME.

An interesting article in the *Temps* draws attention to the deterioration of French roads, especially in the neighbourhood of large towns, the damage being due to the enormous increase of wheeled traffic in recent years. Automobiles, of course, are regarded as the chief agents of destruction. In the last seven years there has been an increase in the Department of the Seine and Seine-et-Oise alone of 8,630 motor-cars and 6,564 motor-bicycles, to say nothing of 108,327 ordinary bicycles. Most of the main roads leading out of Paris are described as being in a "very bumpy" condition, and the question of re-metalling them has become of urgent importance. Pending the discovery of the ideal road material of the future, which, it may be hoped, will result from the proceedings of the International Road Congress in October, the Ministry of Public Works has drawn up a plan whereby seven of the 14 national roads radiating from Paris are to be remetalled for a considerable distance, at a cost of nearly 4,000,000f. (£160,000). The work is to be completed by the end of next year. The actual metalling will be 24ft. wide, of stones 20 centimetres (7.87 in.) long, 10 centimetres (3.94 in.) wide, and 16 centimetres (6.3 in.) deep, laid upon about 2½ in. of fine sand spread over a bed of concrete 6 in. thick. A very slight convexity will be given to the surface. This system of remetalling can only be regarded as the best compromise obtainable at the moment, and French engineers are still seeking for the means which shall enable France to maintain her reputation for the finest roads in the world. The latest objection to the use of tar on the roads to lay dust comes from France, and is a curious one. The result of tarring the Avenue of the Bois de Boulogne is that in four months seven magnificent trees have been destroyed and had to be cut down. It appears that the imperceptible dust rising from the tarred surface has a most deleterious effect upon vegetable life. The cost of renewing the flower-beds along the Avenue is said to be ten times as great as that of watering the untarred road. The allegation of certain angling circles in England that the tarring of roads contaminates the streams and kills the fish must be admitted to gain in probability from the unfortunate experience of the Parisian trees.

ROMAN BUILDING AND SCULPTURE AT CORBRIDGE.

An account of the excavations conducted during the year 1907 at Corbridge, the Roman Corstopitum, by a committee constituted for the purpose, shows a number of highly important discoveries. Corstopitum was not an ordinary fortress, but was laid out and built as a town. Its buildings were massive and important. They have been freely plundered in order to build churches and houses in Corbridge, Hexham, and elsewhere in the neighbourhood, but their foundations still remain to be traced. The principal building excavated was a house, which turns out to be a building of great importance. It had possessed many rooms and corridors, and under some of the rooms were hypocausts containing cooking vessels and other pottery, in fragments which admitted of piecing together and restoration. But the most interesting discovery here made was that of a sculptured group, representing a lion and a stag, which was found in clearing the floor of a cistern. The group was lying flat, and had been broken in two, but the fracture admitted of being accurately put together, and nothing is missing but a chip from the lion's right hind leg and tail. The group measures 3ft. in height and 3ft. in length. The lion is represented standing on the back of the stag, one fore-paw resting on the right antler and crushing it down against the stag's shoulder, while the talons of the other are tearing at the forehead and left eye. The lion's head is turned towards the spectator; the mouth is wide open, and the lips are drawn back so as to bare the teeth on either side and throw the heavy jowl into prominence. There are wrinkles across the nose and up the forehead, and deep puckers round the staring eyes; the sculptor, apparently, has meant to suggest that the beast has turned half round to face some sudden intruder. Beneath the lion's weight the stag lies crushed and helpless, its legs doubled beneath it, its body pressed against the stone, its head strained forward and flattened beneath the lion's claws, while the closed eye and the tongue lolling from the corner of the mouth indicate complete exhaustion. The group is described as being of "first-rate interest and importance." The lion's mouth was adapted to serve as a fountain, a round hole having been cut completely through the stone at the back of the mouth, and a groove cut in the neck of the stag shows the line of a leaden pipe, which presumably passed behind the lion's leg and into his mouth, from which the water was discharged, so that it is natural to connect the group with the cistern in which it was found.

SUNDERLAND AND DISTRICT BUILDING TRADES' ASSOCIATION ADOPTION OF THE "BUILDERS' JOURNAL."

At the general meeting of this Association, held at the Board room, 14, Norfolk Street, Sunderland, on August 20th, it was decided on the advice of the Executive Council, and in reply to a reference from the Northern Counties Federation, to take no further action at present with respect to the wages paid to operatives. It was resolved, on the proposition of Mr. J. W. White, supported by Mr. R. J. Huntley, "That this meeting recommend to a general meeting that the adoption of 'THE BUILDERS' JOURNAL' meets with the approval of this Association, and that all members be asked to support it by subscribing, and, when requiring, to advertise in it. Further, that all members in the future be asked to pay an additional amount of 5s. per annum to their subscriptions, for which they will receive the journal weekly post free; the cost of the journal by post in the ordinary way being 10s. 10d. per annum." The secretary was directed to obtain a supply of specimen copies, to be sent with a letter asking members to take the paper on the reduced scale. The question of tendering for the Durham County Council was also discussed; two important matters at issue are the principle of independent arbitration in case of disputes, and that quantities should be the basis of a contract. The Council had not conceded these points, though other concessions had been obtained. A meeting with the Chairman of the Council's Education Buildings Sub-Committee had been attempted without success, and it was decided to recommend the Northern Counties Federation to call a meeting of members and non-members of the Federation who have tendered for work for the Durham County Council, to go fully into these grievances.

Notes and News.

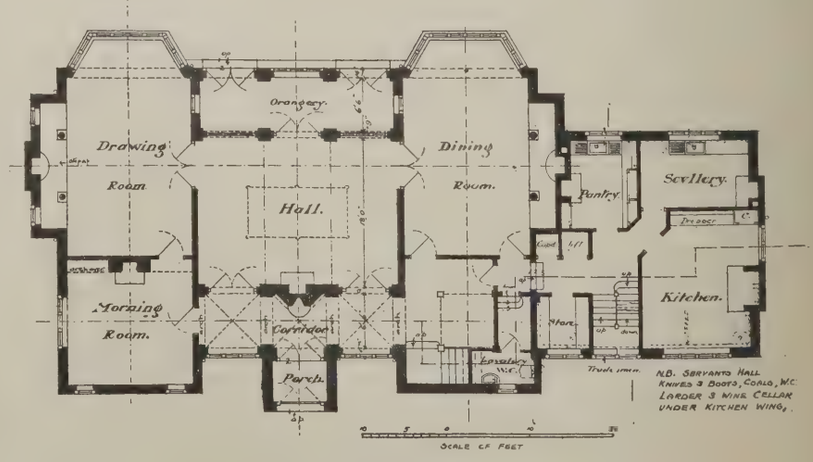
THAT LEEDS IS OVERBUILT is shown by recently prepared statistics, from which it appears that there are in the city no fewer than 7,000 empty houses or shops. In two of the chief thoroughfares there are several rows of excellent shops that were built more than two years ago, and have never been occupied.

REMOVAL.—Mr. Sidney R. Stevenson, architect, Nottingham, has removed his offices from Burns Street to Queen's Chambers, King Street, Nottingham, and will in future work co-operatively with Mr. J. R. Poyser, whose offices adjoin, and with whom this arrangement has been made for mutual business accommodation.

FOR THE TURIN INTERNATIONAL EXHIBITION of 1911 the general plan has been prepared by Signore Fenoglio, Molli and Salvadori, architects. The exhibition will extend along the banks of the Po between the bridges known as Humbert I. and Isabelle, a distance of about a mile and a quarter, while the site, as a whole, will have a superficial area of nearly 1,500 acres. The two banks of the Po will be crossed by a specially constructed bridge. Vast terraces will lead to the summit of a hill, on which will be erected an ambitious national monument.

THE IRON AND STEEL INSTITUTE, of which Sir Hugh Bell is president, will hold its autumn meeting at Middlesbrough from September 28th to October 2nd, both days included.

COASTGUARD STATIONS AS CONSUMPTION SANATORIA is a suggestion that comes from Dorsetshire. Several such stations on the Dorsetshire coast are about to be abandoned, and it has been proposed to the Weymouth Board of Guardians that, failing the erection of a central consumption hospital, for which funds are lacking, these stations might be adapted to meet the deficiency.



A COLLAPSE OF COTTAGES AT BLACKBURN that were in process of demolition caused the death of two children who were playing near, and injured others.

MR. MEDLAND TAYLOR (OF MANCHESTER): A CORRECTION.—In the notice of the late F. H. Oldham, of Manchester, in the last number of the *R.I.B.A. Journal*, Mr. J. Medland Taylor (whose office Mr. Oldham entered as pupil or improver in the year 1864) was referred to as "*the late.*" We are happy to state that Mr. Medland Taylor is still alive and in active practice at 7, Chapel Walks, Manchester.

THE LATE MR. JOHN FULLEYLOVE, R.I., the well-known painter of architectural subjects, and vice-president of the Royal Institute of Painters in Water-Colours, who died on May 22nd, aged 62, left estate valued at £1,666 12s. 3d. gross, of which £1,329 7s. 10d. is net personalty.

MESSRS. W. DUNN AND R. WATSON, F.F.R.I.B.A., architects for the restoration of Dunkeld Cathedral, have been enquiring as to the whereabouts of the old brass lectern, used in the cathedral over 200 years ago, which was supposed to be in some parish church in the Midlands. The lecturn has, we believe, now been located at St. Stephen's, just outside St. Albans.

THE COMMITTEE FORMED TO PROTEST against the proposal to erect additional courts on the open space on the western side of the London Law Courts, known as the Strand Park, have prepared a petition for presentation to Mr. Lewis Harcourt, M.P., First Commissioner of Works. The document, which will be signed by ratepayers in London and taxpayers of the United Kingdom, will ap-

Ground Plan.

peal to Mr. Harcourt "to act in the spirit of the twentieth century, and to save for London this valuable and beautiful open space." The hon. secretary of the committee which has organised the petition is Mr. W. H. Talbot, 146, Fleet Street, E.C.

A BRONZE STATUE OF BOSWELL, the gift and work of Mr. Percy Fitzgerald, F.S.A., is to be unveiled at Lichfield on September 19th, the day following the birthday of Dr. Johnson, from whose statue that of his biographer, will be only a few yards distant. The face is the one in Reynold's portrait, and the figure and costume are derived from Langton's sketch.

R.I.B.A. APPOINTMENTS.

The following appointments to the Institute Standing Committees have been made by the Council under by-law 46:

Art Committee.—Sir Aston Webb, R.A. (F.); John Belcher, A.R.A. (F.); George Frampton, R.A. (H.A.); T. Raffles Davison (H.A.); Geoffry Lucas (A.).

Literature Committee.—J. D. Crace (H.A.); Francis Bond (H.A.); G. H. Fellowes Prynne (F.); C. Harrison Townsend (F.); C. E. Sayer (A.).

Practice Committee.—Ernest Flint (F.); J. Douglass Mathews (F.); W. E. Riley (F.); Thomas Henry Watson (F.); W. G. Wilson (F.).

Science Committee.—F. N. Jackson (H.A.);; A. W. Moore (F.); F. T. Reade, Assoc.M.Inst.C.E. (H.A.); Lewis Solomon (F.); T. H. Markham (A.).

Mr. Edwin T. Hall, vice-president, has been nominated by the Council to represent the Institute on the sectional committee on Bridges and General Building Construction (chairman, Sir John Wolfe Barry, K.C.B.) of the Engineering Standards Committee.

Our Plate.

Clive House, Roehampton, Surrey, is an interesting example of the larger suburban house by Mr. C. H. B. Quennell. As may be seen, the house has an excellent and workable plan, and it is to be deplored that our suburban districts afford us so few dwellings as good as this. Mr. Quennell published some time ago a book of suburban houses, which ought to be more widely studied, both for practical planning on both narrow and ample plots, and also for hints in exterior treatments. The present house is faced with grey stocks with red brick dressings, and the roof is covered with hand-made tiles. The casements are of iron, with leaded glazing. The entrance corridor, shown in a separate view, is finished in plaster, painted white. Messrs. Roffey and Sons, of Putney, were the builders.

A new church for Woolacombe, Devon, is proposed at an estimated cost of £5,000.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

Government Appointments.

BELFAST.—W.T.M. writes:—"Can you give me any information as to where I can obtain particulars of all the technical examinations for engineering appointments held by the Civil Service Commissioners."

See answer to Westminster—"Quercus." Correspondents must invariably send their names and addresses, as evidence of good faith.

Duties of a Clerk of Works on a Small Water Supply Scheme.

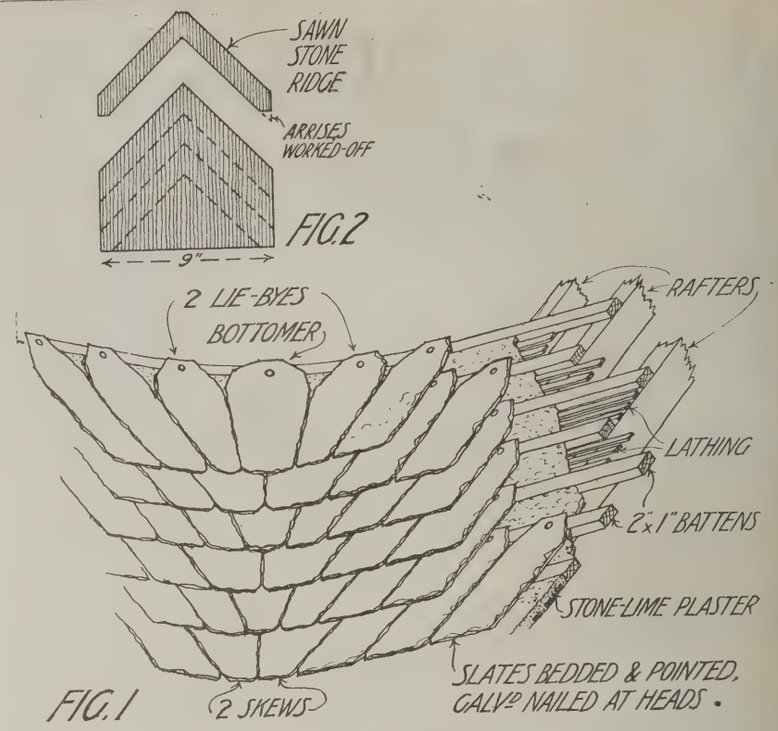
FERMOY.—BEGINNER writes: "Please define the duties to be performed by a clerk of works over a water supply."

The duties of a clerk of works on a scheme of water supply for a small town really embrace those of resident-engineer on a larger scheme, and he is supposed to be directly responsible to the consulting engineer for its proper execution in accordance with specifications, plans, etc. He should have a competent inspector subordinate to him, who, in his absence, could act on the more particularly important points. With respect to reporting to his chief, he is usually required to keep a comprehensive diary; and, in the ordinary course, if the engineer is not resident near the works, the clerk of works takes this diary to him once a week and orally explains details. In an emergency, such as a contractor's refusal to comply with his instructions, the engineer should be at once informed by telegram or letter giving full particulars. The ordinary duties of a clerk of works on small works are:—The setting-out of, checking, supervision, and measuring-up of the whole of the work, taking samples of materials for testing, careful examinations of all foundations, registration of temperatures to govern the making of concrete, and the building of brickwork (neither of which work should be done if the thermometer registers more than 4 degrees of frost), the testing of all pipe and other joints, and the refusal to accept any doubtful work or material whatsoever; and where day-work has to be resorted to, a careful check must be kept on the number of men employed, and their various trades; the contractors should submit sheets daily for the clerk of works to certify or initial as correct. He should keep full details of all extras, orders for which should be given in writing, accompanied where necessary by plans or sketches. Certificates for payments on account to the contractor are usually prepared monthly, and progress plans and sections should be kept, showing (properly dated) the work completed. In the case of way-leaves, etc., where private property is disturbed, damage done, or inconvenience to trades, etc., caused, careful observations, measurements, and dates, should be recorded in the diary for future reference, in case claims are made for compensation. On the completion of the works, he should see that all trenches and other disturbances are made good and left in as perfect condition as possible. With reference to the duties of resident-engineer on a large scheme, they are much more comprehensive and responsible than those

of a clerk of works on a small scheme, and embrace the preparation of plans, etc., for extensions or alterations, testing of cement and other materials, the supervision of clerks of works and inspectors, who should report to him every morning, or oftener if necessary, and the duties of the clerk of works are, in consequence, considerably lessened.

ASSOC.M.INST.C.E.

Roofing with Stone Slates.



AYR.—AILSA writes:—"I want to cover the roof of a small building of old Scotch design with stone slates: how are they overlapped, and are they broken-bonded in the width, and are they checked? If so, are they checked on the sides as well? Also what construction of roof is required to receive the stone covering, and what thickness and size should each stone be?"

To cover a roof with tooled slabs would be a very expensive matter, if it were sought to make a weathertight job. In that case, the rafters would be spaced to the width of the slabs, which would not be broken-bonded, but jointed continuously over each rafter, the joint being covered with a stone capping, very much in the manner of the marble tiles of Greek temples. This would surely be quite out of harmony with the "old Scotch" style. Stone slates are best laid in the manner shown in the accompanying illustration (Fig. 1). The slates are split naturally, from blocks of laminated stone, quarried and exposed to the winter frosts. They are sorted into various lengths, the longer ones (which may be as much as 30 in.) being laid next the eaves, each successive course diminishing in length towards the ridge, where the smallest slates (about 10 in. long) are laid. No special form of roof construction is needed, but the strength of the ordinary forms should be considerably increased, as the stone slate covering is very heavy. After the roof is battened to the gauge of the diminishing courses, the spaces between the battens are lathed, and plastered flush with the battens with stone-lime mortar. Each slate is bedded solid, nailed or pinned at the head, with a single stout galvanised iron nail or oak pin, and pointed in stone-lime mortar. The method of laying a valley without the use of lead is also shown in the illustration, consisting of two and three tapered slates in alternate courses, nailed to curved fittings. All slates are laid broken-bonded; but as the width of the several slates in each course is likely to vary considerably, though the length is the same, no great regularity is attained, and a wide slate will sometimes receive two vertical joints in the course above. Ridges are covered with sawn stone, economically cut from the block in series, in about 12 in. lengths, as shown in Fig. 2. The eaves are laid double, as in ordinary slating, and unless the projection is great, a soffit may be formed by laying a single course of large slates flat upon the wall, over which the ordinary slating tilts, thus leaving no woodwork exposed. G.

Question of a Commission.

LONG EATON.—F.S. writes:—"In August, 1907, I prepared plans for a pair of houses for which a would-be client gave me particulars orally, but nothing in writing. In September he postponed his intention to build. He had a tracing of my plans, and has since given the work to another architect in the town. The houses are now erected, and are exactly as on my plans. I sent the client my account, and he has written that he did not order the plans and is not going to pay for them. Can I make him pay for the services rendered in the preparation of my plans?"

We think that you have good cause for action if you can prove that the houses were erected from your plans. But our recollection of your district is that the majority of the houses there are built on one stereotyped plan, and unless your design has distinct or novel features, which are also present in the houses erected, you would find it difficult to prove this. Consult a solicitor.

ILLUSTRATING ANSWER TO "AILSA," AYR.

Designing Photographic Studios.

DUBLIN.—H.B. writes:—"Where can I obtain particulars for the up-to-date construction of a photographer's studio?"

An article on the subject appears in Specification No. 6, post free, 5s. 9d., from these offices.

Damage to Shop Front.

HEMEL HEMPSTEAD.—In reply to "R.F." we know of no way in which the trouble mentioned may be obviated. It is impossible to control the animals.

Measured Drawings: Royal Engineers' Appointment.

DOVER.—W.P. writes:—"(a) Is there any book published on the method of making drawings, especially of Gothic Tracery? (b) In what division of the Royal Engineers in the new Territorial Army would a draughtsman (architectural) with a fair knowledge of land surveying be of use in the ranks with a chance of promotion, and where could I obtain particulars?"

(a) We do not know of any work of the nature mentioned. (b) The Secretary of the War Office replies to this enquiry as follows:—"Your correspondent should address the secretary of the local Territorial Force Association for any information regarding the territorial force of the district in which he resides. A list of these associations is given in the monthly Army List, which can be obtained through any bookseller."

Official Appointments.

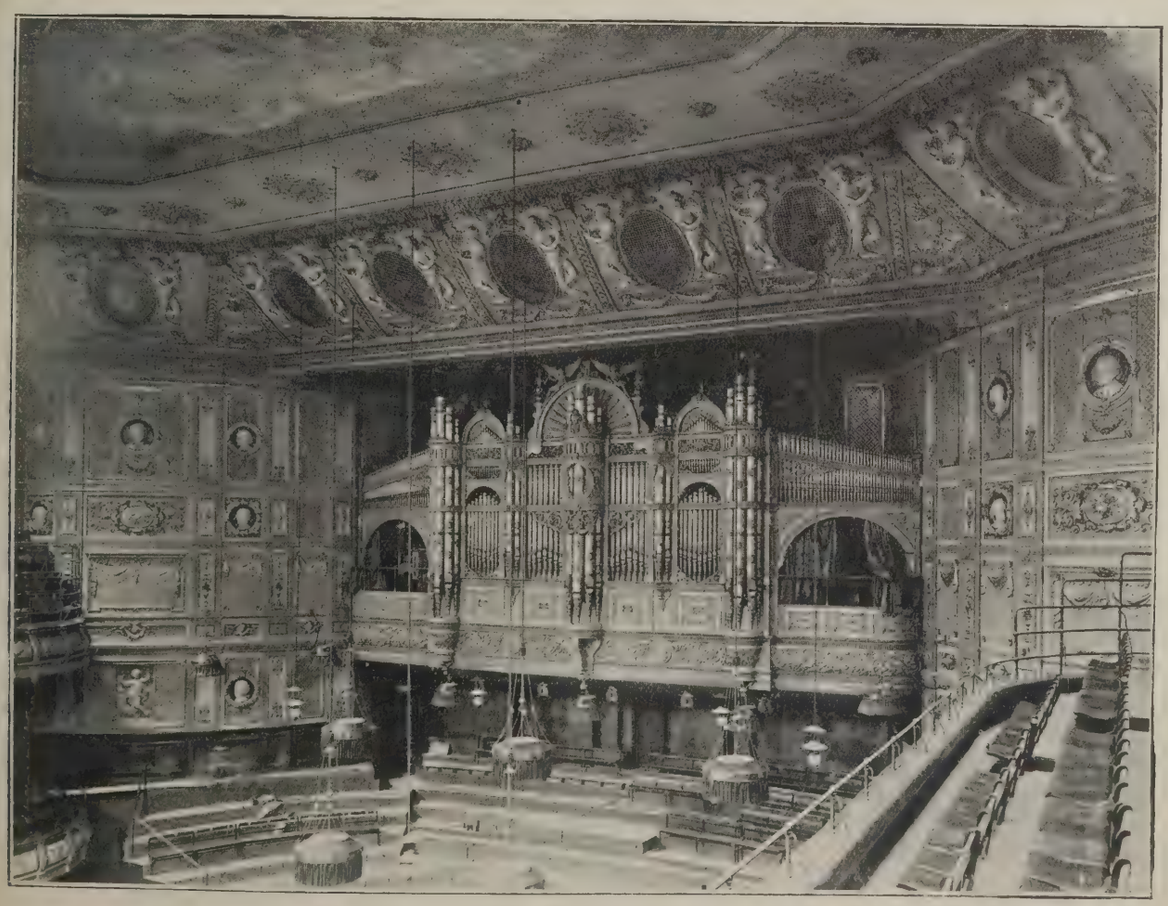
WESTMINSTER.—QUERCUS writes:—"I should be pleased if you could give me particulars of any architectural appointment under the L.C.C. or Government for which I should be eligible to apply. I am twenty-two years of age, and have a good knowledge of construction and building generally, but do not see much before me as an assistant unless I can obtain an appointment in a public office. Is there anything offering a better prospect than architecture in which an architectural training would be of use?"

Appointments on the permanent staff of the architect's department of the L.C.C., when not filled by promotion, are usually advertised in the professional papers and in the *London County Council Gazette*, which is a weekly publication to be obtained of Messrs. P. S. King and Sons, Nos. 2 and 4, Great Smith Street, Westminster, S.W., price one penny. In addition to the permanent staff, there is an unestablished staff in the architect's department consisting of draughtsmen and technical assistants who are engaged in a temporary capacity. The rates of pay range from £1 1s. (for youths) to £4 14s. 6d. a week. The commencing pay for clerk of works is £3 3s. a week. A form of application, on which a number of questions have to be answered as to your technical training, etc., may be obtained from the Clerk of the L.C.C., County Hall, Spring Gardens, S.W. Vacancies also occur during the summer months for temporary employment as clerks of works to superintend the painting of the Council's schools. Applications for this class of employment must be made to the Architect (Education), Nos. 8 and 10, Charing Cross Road, W.C. There is, unfortunately, a long list of applicants for appointments on the unestablished staff, which at the present time is being reduced, so that very little inducement is offered to

the prospective candidate. There are a number of appointments in various Government departments for men who have had a training in architecture, but very few of these offer very bright prospects, as they are for the most part filled with young men, and vacancies occur very rarely. The correspondent had better write to the Civil Service Commissioners, Burlington House, W., asking for particulars of all appointments under Government requiring a previous training in architecture, and from these the correspondent will find out whether any suit his case. Information may also be obtained from the Civil Service Year-book, to be seen in any library. H.M.

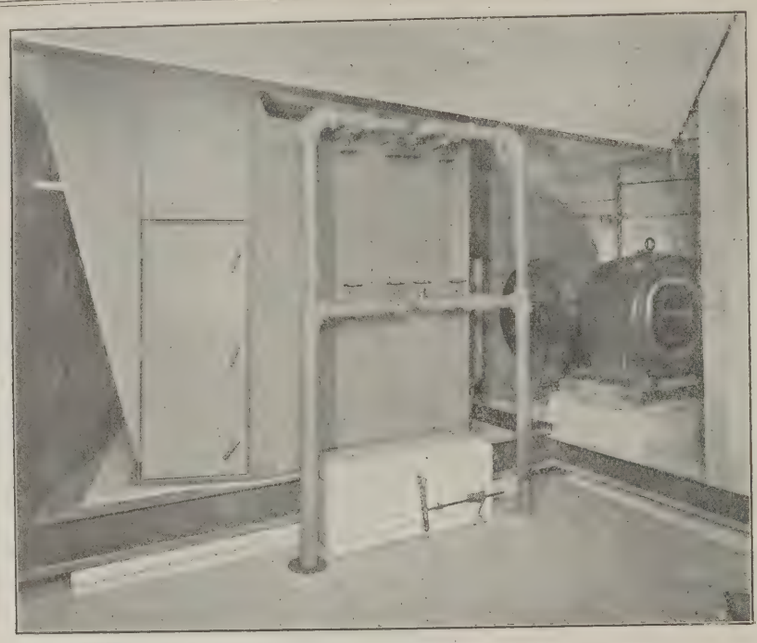
New Street.

YORK.—"E. T. F." writes: "I shall be glad to have your opinion on the following case. A is the owner of certain building land, approached by an accommodation road of an average width of 18ft. A has laid out his land, forming a new street 36ft. wide, and has erected certain houses thereon, the foundations and drains of which have been approved by the Urban District Council's surveyor. The local authority, however, have informed A that unless he provides an entrance to his street 36ft. wide, and in all ways complies with their by-laws, they will refuse to grant a certificate of completion, and thus make it an offence against their by-laws if he allows any of the houses to be occupied. A contends that the entrance to his new street is of the required width, and that he should not be called upon to purchase the strip of land to make the connecting road 36ft. in width."



Unfortunately for A, there is no possible doubt that the Urban District Council are right in claiming that a "new street" shall be laid out, of the full width of 36ft. (24ft. being carriage way, and 6ft. for each footpath), and that the entrance "at one end at least of such street" shall be "of a width equal to the width of such street," "and open from the ground upwards." I cannot at all understand how the situation you describe can have arisen. Did you not deposit drawings before you laid out the new street? The objection would then have arisen before capital had been expended upon the road-making and building.

F. S. I.

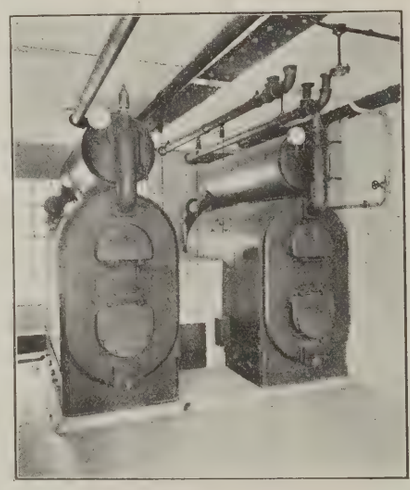


THE QUEEN'S HALL, LONDON.

A New Heating & Ventilating Installation.

At the three gates of the world, Singapore, Port Said, and Charing Cross Station, a man may, according to Kipling, see every friend and acquaintance pass, sooner or later. Without exaggerating overmuch, a fourth foregathering place might be named in the Queen's Hall, London. Certainly it is difficult, nowadays, to discover anyone who has not, at some time or other, been present at one of the ever-popular promenade concerts; and, while this is a tribute to the enterprise which those concerts represent, and to the excellence of the music there provided, it has also served to draw particular attention to the building. With the exception of the Royal Albert Hall, the Langham Place building is at once the largest and most popular concert hall in London, and its acoustics are, generally, very satisfactory. The organ is rather hampered by being hung up on the wall at the back of the orchestra, and the organist is not well placed to see the conductor's baton. In other respects the big semi-circular plan, with an open floor area and two balconies supported on cantilevers, without columns, has proved favourable both to hearing and seeing. The decorations err rather on the side of crudeness, and the figures placed on either hand of the eyelet windows in the roof look coarse and uncomfortable. In one respect, the Queen's Hall was not well equipped, and that a very important one for a building intended for an audience of over 2,000 people. Except for one section of the grand circle balcony, smoking is permitted at the promenade concerts all over the hall, and as a performance progressed the orchestra receded from sight behind a gradually thickening veil of blue vapour, which was intensely irritating to the eyes, and must have been extremely trying to the throats of the singers. The only remedy for this and the heat was to open the doors and the eyelet windows, which meant an unbearable draught in the grand circle and a dangerous breeze on the heads of patrons in the upper balcony. From the accounts of our daily contemporaries, since the commencement of this present season on August 15th, we judge that these defects have been entirely removed by the new system of heating and ventilating, which has been installed during the last few months by Messrs. Richard Crittall and Co., of 197, Wardour Street, W., under the direction and supervision of Mr. E. Wingfield-Bowles, consulting engineer.

THE QUEEN'S HALL, LONDON: INTERIOR VIEW SHEWING NEW AIR INLETS OVER ORCHESTRA.



INTAKE FAN AND MOTOR.

Of this new system, by which the air in the building is now changed six times in the course of an hour, we are enabled to give some interesting views and particulars.

The system is, of course, a mechanical one, this being the only suitable means of dealing with such a vast body of air. A combined installation has been so arranged that the incoming air is warmed in winter and cooled in summer, and in a place devoted to music, where any extraneous sound would jar, this must be accomplished in perfect silence. The fresh air is filtered through screens placed at the south-east angle of the building, the intake fan being a double-inlet cased fan coupled direct to a 20 b.h.p. motor. The air then passes through a duct in the roof, and, as seen in the interior view, is delivered through the eyelets over the orchestra. In winter the air will be driven over heating batteries before being distributed, and one of our illustrations shows the steam boilers on first floor supplied for the purpose of feeding these batteries.

Cool air bye-passes are arranged under the batteries so that it is possible to regulate the temperature of the air while the volume remains the same. The vitiated air is carried away through gratings arranged around the various circles and opening into ducts constructed over the corridors, the whole leading up to the extract fan, which is single-cased, and belt-driven by a 12 b.h.p. motor, the fan delivery discharging into the open air. It is interesting to note that the whole of this installation has been completed without interfering in any way with the usual routine of the work carried on in the hall, in fact, very few people were aware that anything out of the ordinary was taking place.

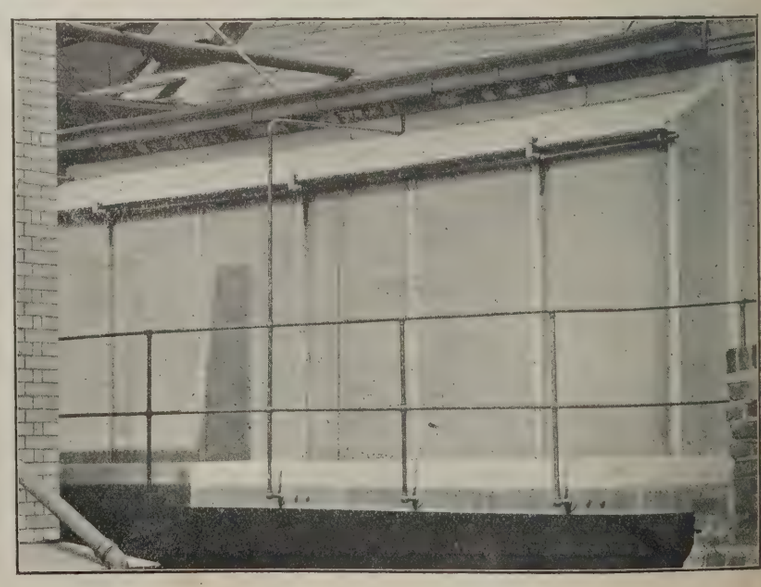
A new church for Stanton-under-Bardon, of which the foundation stone has just been laid, is being built by Messrs. Toone and Warrington, of Anstey, from designs by Mr. E. Turner, of Leicester. It will be faced with granite, lined with bricks and Derbyshire stone. The ultimate cost is estimated at £2,200, but the immediate outlay will be about £800.

THE BOILER HOUSE.

ELECTRICITY IN BUILDINGS.

V.

By Harold Hastings, M.I.E.E., A.M.Inst.C.E.



(*Continued from p.* 102, *No.* 704.)

Cut-outs.

This apparatus constitutes the safety-valve of an installation, and, as too much caution cannot be displayed, cut-outs are always distributed generously.

The principle upon which a fuse operates is that it is the weakest part of the circuit which it protects, and consequently is the first portion to break. Once broken, the current ceases to flow in the wires, and so danger is avoided and attention is called to the fact that something is wrong. A fuse is a short length of wire or strip of a metal with a low melting point. This is inserted in the path of the current, and its cross-section is such that it will heat up considerably when an excess of current flows through the circuit. The exact adjustment striven for in determining fuses is such that the metal will melt when double the normal current is passed. In heavy circuits this is reduced to 1½ times the current. As an example, a circuit which has a flow of 2 ampères, when all its lamps or other apparatus are in use, would have fuses on each pole—*i.e.*, on each wire—which would be so heated by the flow of four ampères that their melting-point would be reached almost instantaneously. A circuit having a normal flow of 100 ampères would have fuses arranged to melt at 150. The melting usually takes place so suddenly that it forms a miniature explosion, which has given rise to the word "blow," instead of "melt," when they operate.

The chief troubles to guard against when examining the design of cut-outs may be thus enumerated: damage or fire caused by the spluttering of the molten metal, breakage of the base or cover if the explosion takes place too violently or in too confined a space, and, worst of all, the maintaining of a flow of current through the metallic gases after the fuse has "blown." This last danger can be obviated by arranging that the fuse is of ample length, or by inserting shields between the terminals to which it is attached.

A PORTION OF ONE OF THE SCREENS.

It will be noted that the strip of metal which melts is the "fuse," but the whole apparatus, base, cover, terminals, and fuse, is called a "cut-out."

The continued flow of current through the vapour of a conductor is termed "sustaining an arc," and various means are adopted for removing the arc should it hold on. It is found to be susceptible to magnetism, and for heavy currents a type of fuse is made having a coil of wire behind the strip, so arranged that when the fuse blows, the current, which would maintain the arc, has first to flow through the coil. The magnetic field thus produced draws the arc into its centre, until it is of such length that it cannot continue. An arc can always be broken by extending its length sufficiently. Hence, a point of design is to have sufficient gap between the terminals, and to have no other metal present to which the arc may jump. A safe rule for small currents, say up to 25 ampères, is to allow ½in. gap for every 100 volts of the system, so that a 200-volt circuit would have cut-outs with 1in. clear gap between the terminals.

Cut-outs are usually made with porcelain bases and covers. Slate is also used for large sizes. Whatever base is employed it must be incombustible as well as being an insulator. Metal covers should not be allowed, the only metal in the apparatus besides the fuse being the brass terminal screws which form the means of connecting the wires, and which also grip the fuse. Double-pole cut-outs, which have both poles on the one base with a screen between them, are of advantage in isolated cases, but two single poles and independent ones are preferable.

Distribution Boards.

When the mains enter a house, they are carried to a distributing centre, and terminate in a "distribution-board." This apparatus consists of a wood case, of ornamental design, containing two long incombustible bases with a non-flammable screen between them. Each base supports a row of fuses, one being positive and the other negative pole. All the terminals on one side of each set are connected together by a copper bar. The fuses are mounted upon small handles with blades which fit into suitable contacts forming part of the terminals mounted on the board. One of the main wires is connected to each copper bar, while from the other terminals the various circuits radiate. The case is provided with a hinged cover having a glass front. The fuses are arranged vertically in pairs, and each pair protects one circuit. Distribution-boards should be well ventilated, otherwise the glass in front may be shattered if three or four fuses happen to blow at the same instant. Besides this, it is found that when fuses are enclosed in a confined space without ventilation they frequently blow in sympathy with one another. Again, the heated air, due to the radiation of a number of fuses, will cause them to blow with a smaller current than that allowed for. It should, therefore, be replaced with cold air. An easy way to arrange for efficient ventilating, in cases where it has been overlooked, is to cut away the corners of the glass front.

Distribution-boards should be fixed in accessible places. They are only examined in cases of emergency, and when all concerned are anxious to have a fuse replaced and current restarted. It does not tend to increase the facilities in this work if the operator has to balance himself on the top of a step-ladder, or work with a candle in one hand. A pantry, a corner in the hall, or upon a landing is generally a convenient spot. If the board is provided with a key it should have a handy hook where the key can always be found. Spare handles, with fuses ready mounted upon them, should always be provided, and they too should be kept in some convenient position close at hand.

Switches.

A flow of current can be immediately stopped by breaking the metallic continuity. Even then there is a certain impetus which causes the current to try to jump the intervening space. This impetus exhibits itself in the form of a spark, where the pressure is not great, and an arc of varying intensity with higher potentials. An arc is always to be avoided, because it must be fed, and, therefore, its continuance indicates that the metal parts, between which it plays, are being consumed. The heat of the arc is well known to be the most intense discovered. It will melt metals, such as platinum, which no other form of heat will affect. Copper does not wait to melt, but vaporises under its action.

These considerations lead to two conclusions in the design of switches, namely, (1) the arc must be reduced to a minimum, and (2) the materials of which the switch is made must be non-flammable. The first is attained by making the blades of the switch fly apart at a great rate, and by so arranging the gear that it is impossible for anyone to manipulate it slowly, or to leave the contacts in any but the "on" and "off" positions. The use of non-combustible materials is of easy solution, since porcelain is so good an insulator.

The difference between a switch and a fuse, as regards arcing, is that a cut-out is recognised as a chamber in which it will occur, and it is provided for; a switch, on the other hand, is not proof against arcing, as it should never occur if the apparatus is properly designed. The covers of switches, therefore, are often made of metal, through which the handle protrudes. The gap between contacts is also less than that between the terminals of a cut-out, being about ½in. to ¾in. for 200 volts. As the tendency to maintain an arc depends not only upon the pressure but largely upon the quantity of ampères flowing, the length of gap increases in relation to both ampères and volts. This is the case also with fuses, but the gaps already referred to may be taken as sufficiently correct for the usual requirements of house-wiring.

Types of Switches.

The most popular type of switch at present upon the market is the "Tumbler" pattern. There are a variety of qualities, and it is not sufficient to know that switches of this pattern are being supplied, to think that they are the best. The purchaser should examine a sample from every batch to see that there is ample surface at the contacts, a sharp, quick-beat action, a good spring, and yet perfect ease in working. They should be mechanically sound, and should have no parts likely to loosen with continual use.

Combined switches and fuses should be avoided. The principle of such a combination is bad. Combined switches and lampholders should be examined with special care, as there are very few patterns that can be said to be satisfactory; besides which, the lampholder is seldom the most convenient place for a switch.

Double-pole switches are usually placed where the main passes into the house, so that they can control the whole installation. They are also used on heavy branch circuits in large installations. A double-pole switch consists of two single-pole ones which have their handles linked together with a bar of insulating material, and mounted upon a common base.

Positions for Switches.

Switches are generally placed at the entrance of a room, or sometimes just outside. This is the best position, as the light can be turned on before the room is entered and extinguished after it is left. In bedrooms it is most convenient to have a switch near the head of the bed controlling the lamp over or near the sleeper. As the bed is not always near the door, and in most bedrooms there are two lights at least (one by the bed and one over the dressing-table), it is advisable to light the second lamp from the door. Another very convenient arrangement is to have two two-way switches connected. By means of this arrangement the lamps can be turned on or off from either point at will. This method is also very successful in a long corridor which may be entered from either end, or a flight of stairs.

If a case ever occurs in which it is required to turn lamps off and on from three distant points at will, this can be done by wiring three three-way switches on the same principle.

In fine, it is false economy to cut down the number of switches in an installation. Every well-placed switch will add to the saving of current, and will soon pay for itself in this way. For instance, a fitting containing three lights should be controlled by two switches—one on two lamps and one on one. It is then possible to use one, two, or three lamps as occasion demands.

Wall Plugs.

Wall plugs are made in two parts, one of which is for attachment to a wall, and the other to the flexible cord of any portable apparatus requiring current. Standard lamps, reading lamps, radiators, and all the accessories to be described later, commonly receive their current through a wall-plug.

The device has two brass sleeve-contacts completely surrounded by and sunk into the porcelain base of the fixed portion. These contacts are each connected with a wire from the opposite poles of the system. The removable part has two projecting contacts corresponding to the hidden ones. They are connected to the two conductors of a flexible cord. The terminals are completely covered with a porcelain shell. When the two parts are joined together, by inserting the projecting contacts in the hidden ones, current is conveyed from the fixed wires to the flexible and thence to the portable apparatus.

All wall-plugs in any one installation must be interchangeable. They are generally fixed on the skirting, though they can be conveniently placed above the picture-moulding. Special patterns are made which can be let into the floor and flush with it. This, however, is an undesirable position, since the wall-plug must receive damage whenever the floor is washed down.

Where it is important that the direction of the flow of the current should always be the same through the portable accessories, the contacts are arranged in the form of concentric rings.

Adaptors are sometimes used to take the place of wall-plugs. They are dummy lamp caps with a flexible attached to the

two contacts. By their use any lamp may be removed and an adaptor put in its place, thence conveying current to the portable apparatus to which it is attached.

Ceiling Roses.

In nine cases out of every ten the wires which pass through the ceiling on their way to supply a lamp enter a ceiling-rose, and from this a flexible cord depends. A ceiling-rose consists of a porcelain base and cover, the latter being screwed on to the former, and having a hole in the centre through which the flexible cord passes. On the base two brass terminals are fixed with two screws each, one for making electrical contact with the wires and the other with the flexible cord. A porcelain screen is moulded as part of the base between the terminals, with suitable holes in it through which to loop the flexible cord, so that the weight of the lamp and shade will not be dependent on the screws alone for support. The wires enter the terminals through the base. Recent patterns of roses are arranged to take two wires in each terminal, as well as the flexible cord, to enable the practice of "looping" to be properly carried out. Looping will be discussed more fully later, but in the meantime it may be stated that this is a method of leading the wires into and then out of the apparatus: they then go to other fittings, and thus the necessity of jointing is avoided. Where looping is thoroughly done it is possible to carry out a whole installation without a single joint. This is of great advantage, as joints are always considered a source of weakness. They are also costly to make, since they occupy considerable time in each case.

Ceiling-roses should always be mounted upon wooden blocks. These may be enamelled white, or merely polished, according to taste. The blocks are supported by two No. 14 screws at least 3 ins. long. Secure fixing must be obtained. If they are not screwed into a convenient joist, the ceiling must be backed with a piece of wood fixed independently of the laths and plaster to the joists on either side. Holes are bored through the block before it is placed in position, for the wires to pass through in their correct relation to the ceiling-rose. The latter is fixed to the block with two 1in. screws.

There are many designs of roses in varying degrees of ornamentation and expensiveness. The main design should be as has been described. Anything containing a fuse should be rejected, a fuse in a ceiling-rose being one of the most inaccessible things possible.

A very useful form of rose is a counter-weight fitting. It is provided with pulleys and a running container for shot to counterbalance the fitting.

Lampholders.

There are two kinds of lampholders on the market—"screw" and "bayonet." The latter are the more popular in England. The difference is in the method of fixing the lamps, and when ordering lamps it is always necessary to state which kind of holder they are for. As the name implies, the method employed in the first case is to screw the lamp into its socket, and, in the second case, to press it in against a spring and give it a slight turn, so that it is retained in the same manner as were the old-fashioned bayonets.

Lampholders are made so that they are suitable for screwing on to a fitting, such as a bracket or an electrolier. They are also made with a grip at their head, consisting of two pieces of hardwood in a hollow cone which bind upon the flexible cord when the cone is screwed round. The insulating material inside the holder is porcelain. It supports two terminal contacts, which connect with metal contacts on the cap of the lamp. In the case of the screw-holder, one contact is in the centre of the fitting, corresponding to one on the centre of the lamp cap, and the other is a threaded case which fits round the cap when it is in position. In the case of the bayonet-holder there are two contact springs which press upon two corresponding plates upon the lamp cap.

Shade rings are an addition to holders to facilitate the attachment of shades. Switch lamp holders have already been dealt with under the head of switches, and are seldom required. Special water-tight holders are made, which have a screwed gland with a rubber washer where the flexible enters. They are for use in exposed exterior situations, or in very damp places generally.

In attaching the wires to the holders they should be prepared just as in the case of jointing. There should be a short length of rubber exposed between the outer covering and the copper. The conductor should be quite clean, and care must be taken to see that the terminal screw grips it properly. With flexibles the practice—so often adopted—of burning away the insulation is a bad one. It should be removed with a sharp knife. (A pair of curved nail scissors forms an excellent tool for this purpose.) It must be cut away in a long slope, so as to avoid nicking the wires. Unless this is carefully done the wires will subsequently break, or, what is worse, all will separate except one or two, and when current is switched on these remaining ones will blow as a fuse, and the outer covering of the flexible may catch alight. When burning is resorted to, the carbonised ends form a path for leakage, and also the wires become very brittle. No ends of wires should be left protruding beyond the terminals, as they may make contact with the shell of the holder, and either cause a short-circuit or, if only touching one side, may give someone an unpleasant shock.

(To be continued.)

INTERNATIONAL COMPETITIONS.

The special committee appointed at the International Congress of Architects in London, 1906, to consider the question of international competitions reported thereon, according to instructions, at the recent Vienna Congress. The Committee consisted of seven delegates, and has drawn up recommendations under twelve heads, to which we shall refer in detail next week. The resolutions arrived at are now to be referred to the various representatives bodies in each country, adherent to the Permanent Congress Committee, for consideration, and a further meeting of the delegates in Paris will be held in the second week of November to discuss any objections or amendments raised and settle a final report to which every nation, represented on the Permanent Committee, shall be held to subscribe.

Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

Free £500 Accident Insurance Coupons have this week been sent to the following:—

E. C. O. (Torquay), R. W. R. (Newton Abbot), O. H. W. H. (Hessle), J. W. (Highbury), G. A. H. (Llandudno), F. D. C. (Beckenham), T. L. (Nantwich), F. B. (Nottingham), W. H. A. (London, W.C.), W. E. COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

September 3. SOUTH GOSFORTH.—Masonry, etc., required in widening Haddricks Mill county bridge, near South Gosforth Station, for the Northumberland county council. Plans and specifications may be seen and bills of quantities obtained from the surveyor. Tenders to be delivered to J. A. Bean, county surveyor, county surveyor's office, Moot Hall, Newcastle, by 9 a.m. on September 3.

September 4. SMETHWICK. — Erection of stabling, at the depot in Rolfe Street, Smethwick, for the Corporation. Plans can be seen and specification and bill of quantities obtained at the office of the surveyor, any day between 9 and 1 and 2 till 5, Saturdays 9 till 1. Applications for quantities must be accompanied by cheque for one guinea. Tenders to be sent under seal, addressed to the chairman of the public works committee, and endorsed "Tender for Stables, Rolfe Street Depot," and delivered not later than noon on September 4 to C. J. Fox Allin, borough surveyor, council house, Smethwick. Fair wages clause.

September 5. CYMMER (Port Talbot).—Alterations and improvements, at the workmen's hall, Cymmer, for the committee. Plans, specifications and bills of quantities may be inspected at the hall on arrangement with Tom John, 10, Maesteg Road, Cymmer, Port Talbot. Tenders, sealed and endorsed, are to be delivered to the chairman, D. Daniel, 13, Maesteg Road, Cymmer, Port Talbot, on or before September 5.

September 5. HASLINGTON.—Erection of New Wesleyan Church and School, Haslington. Tenders to be sent to the Rev. J. Hewitson not later than September 5. For particulars apply to Jas. Martin, architect, Crewe.

September 5. CARNBEE.—Mason, plumber, and joiner work in connection with erection of shelter sheds at Carnbee School, for the School Board. Specifications and plan may be seen on application to Andrew Gilchrist, Carvenom, Anstruther. Offers to be lodged by September 5 with Guthrie and Maxwell, solicitors, Anstruther.

September 5. LANIVET (Cornwall).—Erection and completion of a dwelling-house at Higher Woodley, in the parish of Lanivet, Cornwall, for Mr. C. T. Treffry, J.P. Plans and specifications may be seen on application to James Retallick, Higher Woodley Farm, Lanivet, Bodmin; and further particulars obtained from F. C. Jury and Son, architects, 1, Alma Villas, Tregonissey Road, St. Austell, to whom sealed and endorsed "House Tenders," must be sent on or before September 5.

September 5. BALLYWARD (Banbridge). — Erecting and completing a dwelling-house (with Belfast brick), at Ballyward, near station on G.N.R. (Ireland). Plan and specification may be inspected, and surveyor's quantities obtained, at the office of John M'Aleenan, C.E., Castlewellan; or, at the site, from James Harold, Ballyward, Banbridge, with whom tenders are to be lodged by September 5.

September 5. DUNFERMLINE.—Mason and brick, carpenter and joiner, plumber, slater, plaster, and painter works of internal alterations to County Buildings, High Street, Dunfermline for the County Council of Fife. Plans can be seen and schedules of quantities obtained on application to T. Hyslop Ure, architect and surveyor, 43, Carnegie Street, Dunfermline. Sealed tenders to be lodged with David Mackenzie, C.E., clerk to the County Buildings Sub-Committee, County Buildings, Dunfermline, on or before September 5, marked outside, "Tender for County Buildings Alterations."

September 7. MILTON REGIS.—Erection of a store in Gas Road, for the Urban District Council. Plans and specifications may be seen and full particulars obtained at the office of the surveyor, Town Hall, Milton Regis, between the hours of 10 a.m. and 4 p.m. Tenders, suitably endorsed, to be delivered not later than noon on September 7, to Jno. Dixon junr., clerk to the Council, Town Hall, Milton Regis.

September 7. WEYMOUTH.—Erection of a kitchen, alterations to bath-rooms and the hot-water supply, and external painting, at the isolation hospital, Cold Harbour Lane, Radipole, for the Rural District Council. Plans, etc., may be seen, and the site of proposed building inspected, on application to the caretaker at the hospital. Tenders should be submitted not later than September 7.

September 7. ROCHFORD. — Builder's work required at Rochford Workhouse, for the Union. Plans, etc., may be seen at the office of the clerk. The work is divided into four parts, and a separate tender is required for each. Tenders, endorsed "Tender for Covered Way, etc.," must reach Frderic Gregson, clerk, 46, Alexandra Street, Southend, not later than September 7.

September 7. POOLE.—Works of construction to No. 3 groyne on the shore at the sandbanks, for the Poole Harbour Commissioners. Plans and specification can be seen at the office of H. F. J. Barnes, surveyor to the Commissioners, Poole, after payment of £2 2s., which will be returned upon the receipt of a bona fide tender. Tenders will be received at the Harbour Office, Quay, Poole, up to noon on September 7, endorsed "Tender, Groyne."

September 8. GODREAMAN (near Aberdare). —Erection of a new boys' school, outbuildings, laundry, cooking kitchen, workshop, etc., at Godreaman, near Aberdare, for the Urban District Council. Plans and specification may be inspected and a copy of bills of quantities obtained at the Education Offices or at the offices of the architect, T. Roderick, Clifton Street, Aberdare, upon payment of the sum of £2 2s. to the Director of Education, which will be returned on receipt of a bona fide tender. Sealed and endorsed tenders to be sent in not later than September 8 to John Morris, Director of Education, Education Offices, Aberdare.

September 9. KILKEEL.—Erection of 52 labourers' cottages (including fencing of plots), for the Rural District Council. Full particulars and instructions can be obtained by enclosing a stamped addressed envelope to W. Hughes, clerk of Council, Board Room, Kilkeel. Tenders must be delivered not later than September 9.

September 9. CRAGHEAD.—Erection of an addition to the Craghead social club and institute, consisting of a corrugated iron billiard room, with brick cellar under, etc. Plans and specification may be seen on application to the steward of the club, and tenders to be sent to the secretary at Craghead on or before September 9, sealed and marked "Tender for Club Addition."

September 9. LONDON, W.—Erection of a block of shops and showrooms at 143-9, Great Portland Street, London, W. Drawings, specification, and conditions of contract may be inspected at the offices of the architects, John W. Simpson and Maxwell Ayrton, 3, Verulam Buildings, Gray's Inn, W.C., from August 24 to Sept. 8, between 10 and 4. Bills of quantities and forms of tender may be obtained at the same address on payment of three guineas. The sums so paid will be returned to those persons who send in tenders on the forms provided in conformity with the conditions. Tenders must be delivered before noon on Sept. 9, addressed to the Owner, Great Portland Street site, care of Messrs. Jubber and Co., 61, Great Portland Street, W., and endorsed "Tender for Shops and Showrooms."

September 9. LETCHWORTH GARDEN CITY. —Erection and completion of a new County Council school at Letchworth Garden City, for the Education Committee of the County Council. Persons desiring to tender for the work may see the drawings, specification, agreement, etc., at the county surveyor's office, Hatfield, between the hours of 10 a.m. and 4 p.m., except on Saturday, when they may be seen from 10 a.m. till 12 noon. A copy of the schedule of works (quantities) and a form of tender can be obtained at the county surveyor's office, on or after the above-mentioned date, upon payment of two guineas, which sum will be returned to the tenderer upon receipt of a bona fide tender and the documents which have been supplied to him. Sealed tenders, endorsed 'Tender for New School, Letchworth," must be delivered to Urban A. Smith, county surveyor, County Surveyor's Office, Hatfield, not later than 5 p.m. on September 9. Such security for the due execution of the works as the council may require must be given by the contractor.

September 9. WIMBLEDON.—Extensions to the domestic economy centre, Queen's Road schools, Wimbledon, for the education committee of the Corporation. Plans and specification may be inspected, and bills of quantities obtained, on payment of two guineas (which will be returned on receipt of a bona fide tender), at the surveyor to the education committee's offices, town hall, Wimbledon. Tenders must be delivered not later than noon on September 9.

September 10. CARDIFF.—Pulling down and rebuilding Nos. 18 and 19, Church Street, Cardiff, for Messrs. Cross Brothers, Limited. Plans etc., can be seen and bills of quantities obtained, from the architect, on a deposit of two guineas, returnable on receipt of a bona fide tender. Sealed and endorsed tenders to be delivered not later than September 10, to Veall and Sant, architects, Cardiff.

September 10. TIPTON.—Alteration and extension of public offices, Owen Street, Tipton, for the Urban District Council. Drawings and specification may be seen and all information obtained on application to Wm. H. Jukes, M.E., engineer and surveyor, Surveyor's Offices, Public Offices, Tipton, any day during office hours, and on payment of one guinea, which will be returned on receipt of a bona fide tender. Tenders to be sealed and sent in on the forms provided to the clerk to the Council, on or before September 10. Fair wages clause.

September 10. SUNDERLAND.—Construction of buildings for plant, offices, boiler house, and chimney, workshops, entrance gates, etc., at the Ayre's Quay works, for the Sunderland Gas Company. Specification, bills of quantities, and plans may be inspected at the engineer's office at Hendon gas works, Commercial Road. Arrangements to inspect site can be made on application. Tenders to be delivered on or before September 10, to John H. Cox, secretary and manager, Fawcett Street, Sunderland.

September 12. LEES. — Adapting premises situate in Cross Street and Booth Street, Lees, known as the Christian brethren congregational chapel, as a board-room and offices, for the Urban District Council. Specifications, etc., may be obtained on application to Whitehead and Platt, architects, High Street, Lees, on payment of £1 1s. Tenders should be submitted not later than September 12.

September 12. KILLALOE (Co. Clare).—Erection and completion of a new chapel at Garraunboy, Killaloe, Co. Clare, for the Very Rev. Canon D. Flannery, P.P., and committee. Drawings and specification may be seen at the parish priest's house, Killaloe, or at the office of the architects. Bills of quantities for the use of builders tendering can be had at the office of O'Malley and O'Rourke, architects, 10, Glentworth Street, Limerick, or with the parish priest. Sealed tenders, endorsed "New Chapel, Garraunboy," accompanied by bills of quantities, must be delivered to the parish priest on or before September 12. Two solvent sureties required for the due performance of the contract.

September 12. GRANGE-OVER-SANDS.—Erection of a balcony, and alterations in the Victoria Hall, Grange-over-Sands, for the Urban District Council. Plans and specifications may be seen, and bills of quantities and form of tender obtained from Henry T. Fowler, A.R.I.B.A., 6, Cornwallis Street, Barrow, or from Thos. Huddleston, surveyor to the Council, Council Offices, Grange-over-Sands. Sealed tenders, endorsed "Victoria Hall Balcony," will be received up to five o'clock p.m. on September 12.

September 12. TUNSTALL. — Erection of 48 workmen's dwellings, at Tunstall, for the Sunderland Rural District Council. Plans and specification may be seen at the office of Joseph Spain, A.R.I.B.A., architect, 12, John Street, Sunderland, from whom bills of quantities can be obtained on payment of two guineas, which will be returned on receipt of a bona fide tender. Whole tenders only will be received, and must be delivered, endorsed "Workmen's Dwellings, Tunstall," not later than noon, September 12, to J. C. Wilson, clerk to the council, Rural District Council offices, 17, John Street, Sunderland. Fair wages clause.

September 12. MILTON REGIS (Kent).—Erection of an enlargement, to provide accommodation for about 260 scholars, to the council school, at Ufton Lane, Milton Regis, Kent, for the education committee. Plans and specification, prepared by the committee's architect, Wilfrid H. Robinson, M.S.A., may be inspected at the offices of the committee, on or after September 3, between the hours of 10 a.m. and 4 p.m. Any person desiring to tender, and to receive a copy of bills of quantities, must send his name to Fras. W. Crook, secretary, Caxton House, Westminster, S.W., accompanied by a deposit of £1, not later than noon on September 3. The deposit will be returned, provided a bona fide tender shall have been submitted, and not with-

drawn. Tenders, on the form supplied, with bills of quantities, in a sealed envelope, endorsed "Milton Regis Ufton Lane Tender," must be delivered to the school correspondent, J. Filmer, Albion House, London Road, Sittingbourne, Kent, not later than noon on September 12.

September 14. HERTFORD.—Erection and completion of a new county record and strong room at Hertford, for the County Council. Persons desiring to tender may see the drawings, specification, agreement, etc., at the county surveyor's office, Hatfield, between the hours of 10 a.m. and 4 p.m., except on Saturdays, when they may be seen from 10 a.m. to 12 noon. A copy of the schedule of works (quantities) and a form of tender can be obtained at the county surveyor's office upon payment of two guineas, which sum will be returned upon receipt of a bona fide tender and the documents which have been supplied. Sealed tenders, endorsed "Tender for New Record and Strong Room, Hertford," must be delivered not later than 5 p.m. on September 14, to Urban A. Smith, county surveyor, county surveyor's office, Hatfield. Such security for the due execution of the works as the county may require must be given by the contractor.

September 14. LYDBROOK (near Ross).—Erection of a public elementary school at Lydbrook, near Ross, for the Gloucestershire Education Committee. Plans and specifications may be seen at the office of M. H. Medland, architect, 15, Clarence Street, Gloucester. Bills of quantities and form of tender may be obtained from E. A. Pryer, surveyor, 15, Clarence Street, Gloucester, upon payment of two guineas, which will be returned on receipt of a bona-fide tender. Sealed tenders, endorsed "Tender for School at Lydbrook," must be delivered not later than 9 a.m. on September 14 to H. W. Household, secretary to the Education Committee, County Education Office, Gloucester.

September 15. OXFORD.—Erection of the new church of St. Stephen, Lonsdale Road, Summertown, Oxford, for the building committee. Plans, specification of works, and conditions of contract may be seen, and form of tender, with bills of quantities obtained, at the office of A. Mardon Mowbray, architect, 117, St. Aldate's Street, Oxford, during office hours, on payment of five guineas, which will be returned on receipt of a bona fide tender. The contractor will be required to enter into a bond, with two responsible sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. Tenders, sealed and endorsed "Summertown New Church" to be delivered not later than noon on September 15, to Rev. C. J. Burrough, Summertown Vicarage, Oxford.

September 15. BACUP. — Erection of a new school in Burnley Road, Bacup, for the education authority of the Corporation. Each trade may be tendered for separately. Specification and quantities may be obtained and plans seen at the office of the architects, S. Butterworth and Duncan, F.R.I.B.A., South Parade, Rochdale, on and after September 3, on payment of the sum of one guinea. Tenders, endorsed "Northern School," to be delivered not later than September 15, to Joseph Entwistle, town clerk.

September 16. PORTSMOUTH.—Erection and completion of two pairs of dressing-rooms at the north end recreation ground in the borough of Portsmouth. Specification and plan may be seen and form of tender obtained at the borough engineer's office, town hall. The form of tender is to be filled in and sent under cover to reach Alexander Hellard, town clerk, town hall, Portsmouth, not later than 10 a.m. on September 16. Fair wages clause.

September 21. SUTTON COLDFIELD.—Erection of a school to accommodate 200 children in the Green Lanes, Chester Road, for the Corporation. Specification and quantities may be obtained from Crouch, Butler, and Savage, architects, 39, Newhall Street, Birmingham, on deposit of two guineas. Tenders, marked "Green Lanes School," to be delivered on or before September 21, to R. A. Reay Nadin, town clerk, council house, Sutton Coldfield.

September 23. NEWBRIDGE (Mon.).—Erection of thirteen villas at Newbridge, Mon., for the North Road building club, Newbridge. Plans and specifications may be seen at the office of A. J. Bowen, architect, Crown Street, Crumlin. Sealed tenders, endorsed "Tender for Villas," to be sent to T. A. Thomas, Bryn-Awel, Abercarn, Mon., not later than September 23.

September 24. ASHFORD.—Construction of a brick-foundation, timber and iron-covered cowshed for 20 cows, at Henwood Farm, Hythe Road, Ashford, Kent, for the Urban District Council. Plan and specification may be seen, form of tender, and any other information obtained, on application to William Terrill, surveyor, 5, North Street, Ashford, Kent. Sealed tenders, endorsed "Cowshed," to be sent to John Creery, solicitor, 11, Bank Street, Ashford, not later than 5 p.m. on September 24.

No date. DUBLIN.—Erecting and repairing a residence at Lugg, near Brittas, Co. Dublin. Specifications can be had at 43, Arran Street East, Dublin.

No date. FFORESTFACH.—Erection of 10 houses in Armine Road, Fforestfach. Particulars can be obtained from Charles S. Thomas, M.S.A., 15, Wind Street, Swansea.

No date. CROSS HANDS.—Erection of ten cottages at Cross Hands. Particulars can be obtained from the architect, Charles S. Thomas, M.S.A., 15, Wind Street, Swansea.

No date. SOUTHAMPTON.—Erection of six cottages at Southampton. For plans and specifications apply H. M. Camfield, auctioneer and land agent, Woolston, Southampton.

No date. WALLSEND (Northumberland).—Erection of a new boot factory for the Wallsend Industrial Co-operative Society. Plans, specifications, and bills of quantities, prepared by Shewbrook and Hodges, architects, Newcastle, may be seen on application to F. Robertson, secretary.

No date. BESSBROOK (Co. Armagh).—Erecting and completing new female schools, at Convent of Mercy, Bessbrook, Co. Armagh. Plans and specification can be obtained from J. J. M'Donnell architect, 27, Chichester Street, Belfast, to whom sealed and endorsed tenders are to be sent.

ENGINEERING.

September 3. PENISTONE (Sheffield).—Taking out the existing heating apparatus boiler at Millhouse provided school, near Penistone, and fixing new sectional boiler in place of same, for the West Riding county council (education department —division 12). Specification may be had from T. R. Bryan, divisional clerk, education offices, Penistone, near Sheffield. Tenders must be sent to the divisional clerk by September 3.

September 3. CORK.—Execution of the following works to specifications, which may be inspected at the boardroom, for the Rural District Council. (a) Sinking well and erecting pump at Laherdane. (b) Sinking well, supplying and erecting pump at Killeagh Cross. (c) Erecting two fountains at Little Island. Each party tendering is required to give the names and addresses of two solvent sureties who are willing to enter into a bond for the due performance of the work. Tender forms may be obtained on application to John Cotter, clerk of council, boardroom, workhouse, Cork. Tenders will be received not later than noon on September 3.

September 4. DUBLIN. — Supply and erection of boiler plant, etc., at the pigeon house generating station, for the Corporation. Specification, with general conditions and form of tender, can be obtained from the city electrical engineer, Fleet Street, Dublin, on payment of one guinea for each specification, which will be returned on receipt of a bona fide tender. "Tenders, addressed "Chairman of the Lighting Committee, 3, Cork Hill, Dublin," and marked "Tender for Boiling Plant," to be received not later than noon on September 4.

September 8. EXETER. — Covering in two service reservoirs, at Dane's Castle, for the Corporation. Drawings and specifications may be seen, and form of tender, together with a copy of the quantities, obtained between the hours of 10 a.m. and 4 p.m. (10 a.m. and noon on Saturday), at the office of Thos. Moulding, Assoc. M.Inst.C.E., city engineer and surveyor, Municipal Offices, Exeter, on deposit of two guineas. Sealed tenders, endorsed "Tender for Covering Reservoirs," must reach H. Lloyd Parry, town clerk, not later than 4 p.m. on September 8.

September 10. EASTNEY (Portsmouth). — Repairing main pumps and engines at the Eastney pumping station, for the Corporation. Specification may be seen and form of tender obtained at the borough engineer's office at the town hall. The form of tender is to be completely filled in and sent under cover not later than 10 a.m. on September 10, to Alexander Hellard, town clerk, town hall, Portsmouth. Fair wages clause.

September 10. ROTHERHAM.—Heating the Alma Road council schools, for the Corporation. Plans of the schools and further particulars may be obtained at the office of the architect, J. Platts, Rotherham, until September 10. Tenders, sealed and endorsed "Tender for Heating Alma Road Council Schools," to be sent not later than September 10, to Spurley Hey, director of Education, education offices, town hall, Rotherham. Fair wages clause.
